Daily Evening Globe - Dec. 26, 1862 Mineral Localities of New Brunswick. - A Paper Read Before the Natural History Society of New Brunswick, At Its Last Meeting, By Mr. G.F. Matthew. - As no systematic list of the various mineral localities in the Province has heretofore been published, and the greater number still remain unknown to those who have not access to the few existing sources of information on the subject, I have endeavored to supply a want by collecting the numerous notes scattered through Gesner's report on the Geology of New Brunswick, adding thereto notices of localities discovered since his survey was brought to a close. In this work the writer has received valuable aid from his brother, as also from the late Dr.Robb and Mr. Wm. Payne of Portland. As the two branches of Natural Science, Geology and Mineralogy, are so intimately connected, it will be necessary, in order to obtain a comprehensive view of the character of the mineral deposits mentioned in the accompanying list, to give sketch of their geological distribution. The Province of New Brunswick is mostly occupied by unaltered rocks of aqueous origin. It is traversed, however, by three metamorphic bands which originate in a district of the same character, occupying the greater part of the County of Charlotte, and extending thence westwardly into the State of Maine. The northern land, pursuing a N.N.E. course through the Counties of York, Northumberland and Gloucester, terminates on the Bay of Chaleur. The 4 southern, of which the intermediate band passing through King's County is a subordinate spar, skirts the Bay of Fundy on its northern side as far as Chignecto Bay. A metamorphic district, of which little, however, is known, also exists about the head waters of the Tobique, Upsalquitch and Nepisiguit Rivers. The triangular area intervening between the two bands of altered and igneous rocks is occupied by an extensive coal formation, having deposits of Limestone and Gypsum, principally in the lower beds of the basin. On the triangular side of the first mentioned metamorphic band is another large and comparatively level district in which calcareous and argillaceous shales, of Silurian age, prevail. No great variety of minerals has been found in either of these flat districts, nor is it to be anticipated that there will be. Those, however, which do occur, are mostly of economic value (ores of iron, coal, gypsum, &c.) To the metamorphic bands and the district in which they unite therefore, we may look for the principal and more varied accessions to our mineral wealth. The following remarks regarding the southern metamorphic district are based upon the writer's own observations.The limestones of St. John Co. to which the localities in Portland pertain may have been produced by chemical deposition; for, although, they are only partially altered in many places, no fossils, except obscure vegetable remains have been detected in them. From the abundance of magnesian silicates we might suppose that these calcareous beds are, in part, ""dolomite."" The granite and gneiss of the limestone district contain tourmaline, epidote and laumontite, and small quantities of the sulphurets of iron, copper and lead, besides their ordinary constituents. Epidote is eminently characteristic of the trappean beds of Upper Devonian age, which extend in a double curve from Musquash to Bloomsbury Mt., and probably beyond. It is usually accompanied by quartz, specular iron and chlorite. Sheldon's Point is in this belt, and the minerals of Kingston and Clifton occur in stratified greenstone, probably of the same age; while those of Cape Spencer, West Beach and Black River are in overlying beds of sedimentary origin, largely charged with volcanic products. It will be seen that none of the zeolites found in the Triassic traps of Nova Scotia have yet been detected in the Devonian beds of volcanic origin on the North Shore of the Bay of Fundy; these latter seeming to hold (with the exception of chlorite and prehnite) anhydrous silicates only. The N.S. zeolites have been met with at only one locality in the Province - the Island of Grand Manan. It is not improbable, 5 therefore, that the trap of this island, like that of Isle au Haut and the North Shore of the Basin of Minas, is an outlier of the great masses which skirt the southern shore of the Bay of Fundy. Mineral Localities. - (This list was prepared three years ago for a supplement to Dana's Mineralogy which was not issued owing to the illness of the author of that work. I therefore feel that I am now at liberty to place it at your disposal. Alterations in the arrangement of some localities have been made, a few unimportant ones struck out, and others added. The marks used to distinguish the character of the specimens are similar to those in Dana's Mineralogy, viz: those which may be had in good specimens are underlined, (!) is added where they are remarkably good, (!!) where the specimens are unique. (NOTE - underlined articles are bracketed with square brackets, i.e. [coal] Albert County Grindstone Point and Island - Lignite, Iron Pyrites, Barytes. Hopewell - Gypsum, Selenite, [Alabaster].Albert Mines - Albertite !! Pollet River, 15 miles up - Coal. Shepody Mt. - Pyrolusite, [Calc spar], (rhombs with Manganese), Iron Pyrites, Native Alum, a clay. Turtle Creek - Coal. Carleton CountyWoodstock - Copper Pyrites, (mined) Wad, Bog Iron Ore. At Iron Mines - Hematite, Limonite. Charlotte County Beaver Harbour - Red jasper, Chlorite. Campobello island; at Welshpool - Iron Pyrites, Galena, Blende, Erubescite, Copper Pyrites. At head of Harbor de Lute - Galena, 4 in. vein. At Head Harbor - Iron Pyrites, Copperas. Deer Island, on N.W. side - Magnetic Iron, Calc Spar, (in Amygdaloidal) Hornstone, Quartz, (in trap). Digdeguash R., at Hog Island - Red jasper. On W. side of entrance - Calc Spar, (rhombs, in conglomerate,) Chalcedony, (in Greenstone,) At Rolling Dam - Graphite. Grand Manan Island, between Northern Head and Dark Harbour - Amethyst, Agate, Jasper, Hornstone, [Thompsonite, Stilbite, Heulandite, Calc Spar, Zeolite (Mesotype?), Apophyllite], Specular Iron, Magnetic Iron. At Whale Cove - Calc spar ! Heulandite ! Laumontite ! Stilbite ! Semiopal ! At Fish Head (2 miles S. of Eel Brook) - Chlorite, (abundant in qtz). At Ross's Island - Quartz Crystals. White Head - Chlorite, Quartz Crystals. At Kent's Island - Veined Marble. L'Etang Island and Harbour - Marble, Serpentine, Chlorite, Iron Pyrites. Le Tete - Galena, Erubescite, Copper Pyrites, Barytes. 6 Magaguadavic R., at entrance - Veins of copper pyrites, Malachite, Azurite. One eighth of a mile E. - Galena. Red Head, (on Mace's Bay) - Red jasper. Seeley's Cove, Hill 1/2 mile N. of - Quartz crystals, Calc spar, Magnetic Iron, Iron Pyrites. St. Stephen, 4 1/2 miles N. of - Graphite (in greywacke). Molybdenite, (in gneiss.) Milltown - Pyrites. Simpson's Island, on the Shore - Copper glance, Malachite. [See note]. Waweig R., 3 miles up, at Cormick's Mills, - Pyrites, Feldspar, Schorl and Garnet, (in boulder). At Bartlett's Pond - Quartz crystals. At Oak Bay - Hepatic Pyrites, in greywacke.) Gloucester County Bathurst - Malachite, (in coal). Eight miles from, on Tete-a-gouche R. - Manganite, (in crystals and crystalline,) [Copper Pyrites]. Kent County Buctouche R. - Coal. Cocaigne R., on branch, 3 miles from bridge - Coal. Richibucto R., 3 miles above Ford's Mills and at Big Brook - Coal. At Bass R. - Iron pyrites. Half mile W. of Liverpool - Bog Iron Ore. Kouchibouguaasis R. - Coal. Kings County Belleisle Bay, on N. Shore - Galena, (in limestone), veins of chalcedony, Jasper and Hornstone, (in trap). One and a half miles W. of Bull Moose Hill, on farms of Northrup and Benson - Large bed of Magnetic Iron. Clifton - [Orthoclase], (xls) Epidote, [(Pistacite)]. (common xls.) [Chlorite], (abundant granular,) Prehnite, all in bedded greenstone, Quartz crystals, Specular Iron. Hammond R., at Sherwood's - Graphite, (in limestone). Hampton, and at Darling's Lake, in loose pieces - Agate, Carnelian, Red jasper. Kingston, on ridge S. of village - Magnetic Iron, Magnetic Pyrites; also, Chlorite and Red jasper. Nerepis, near Hatfield's Mill - Iron Pyrites, (in greywacke). Near Mather's Inn - Amethyst, Quartz Crystals, Feldspar. Norton - Near Choat's Mill, on road to Belleisle - Argentif. Galena. One mile N. of Baxter's Inn - Specular Iron (xls) and Red Hematite. Quispamsis - Pyrites, Copper pyrites, Galena, Laumontite. Sussex, 1/4 mile from church, on McReady's farm - 7 [Selenite !] (hexagonal xls. forming in the mud of a spring.) [There are two fine groups of crystals from this locality in the Museum of the Mechanics' Institute.] Eight miles from Station, on Dutch Valley road - [Manganite], Pyrolusite, [Barytes.] Upham - Brine springs.Four miles E. of Titus Mill - Gypsum Northumberland County Boiestown - Coal. Barnaby's R., opposite mouth - Coal. Chatham - Coal, Iron Pyrites. Newcastle - Coal. Queens County Grand Lake, at Grand Point - Fossil Trees, containing Barytes, Pyrites, Copperas. Salmon River, (on Crawford's farm) - Coal, Caly, Iron Stone, Pyrites, Copperas. Newcastle - Coal mines. Coal Creek - Coal, (formerly mined.) Long Reach, opposite VanWart's - Chlorite. Washademoak River - Coal, (2 1/2 miles from Long's Creek.) Few miles above mouth on S.E. of a small cove - Hornstone, Jasper, Chalcedony, Carnelian, Quartz Crystals. Restigouche County Belledune Point - Verd Antique, Serpentine, Iceland Spar! Dalhousie, near to - [Agate], Carnelian. Point le Nim - Coal. St. John County Carleton, near Falls - Red Calcite. Chance Harbour - [Calc spar] (deep red xls) in quartz veins, Chlorite (in argill and talcose state). Brandy Brook - Quartz crystals. - Epidote (Pistacite) and Hornblende in boulders. Black R. settlement. - [Quartz crystals], Chlorite, Calc spar, Copper Pyrites, Specular Iron !(tabl. xls) Little Dipper Harbour, on W. side - Barytes, quartz crystals, Amethyst (in compact greenstone). Moosepath - Schorl (crystals), Hornblende (crystals), Felspar (red), Muscovite, Albite (?) Musquash, on E. side, Harb. at entrance - Graphite, Pyrites, Copperas. At Shannon's - Serpentine, Verd-Antique, [Chrysotile.] E. side of Musquash - [Quartz crystals] (veins in conglomerate). Portland, [Crow's Nest - Serpentine,] Chrysotile, Steatite, Magnesite, Asbestos. [Drury's Cove] - Indurated Talc, Pyrallolite (?), Graphite, Pyrites.[At the Falls] - Graphite (impure bed 4 ft.) [Fort Howe Hill] - Graphite, Calcite (several forms, viz: dogs-tooth spar, nail-head spar, &c.) [Howe's Road], 1 1/2 miles from St. John - Epidote (in syenite). ! 1/2 mile from road [Tremolite], Steatite, Mica (?). [Lily Lake] - Serpentine, Chrysotile, Talc, (radiated), Steatite, Graphite. [White Augite] (?). Quaco, Light House Pt. - Manganese, ([Pyrolusite]), (bed 4 ft). W. of Point - Lignite. E. of Quaco, Fuller's Creek - Graphite, Iron Pyrites. Farther Eastward - Schorl, Asbestos, Chrysotile, Serpentine. Sheldon's Pt. - [Epidote] (Pistacite and Zoisite), Actinolite, Asbestos, Calcite, Specular Iron, Malachite. Cape Spencer - Specular Iron (crystals), Calcite (crystals), Talc, Chlorite, Asbestos. Ten Mile Creek - Coal in slate and sandstone. West Beach - At Evan's - Quartz Crystals, Talc, Chlorite. Half Mile W. of Evan's - Vein of Magnesite with Talc, Chlorite and Magnetic Iron, Copper and Iron Pyrites, [Hematite], [Specular Iron]. [See note.] Point Wolf and Salmon R. - Iron and [Copper] [Pyrites], Asbestos, Chlorite, [Erubescite], Chrysocolla, [Cuprite.] Sunbury County Oromocto River, N. Branch, 10 miles up - Coal. Lincoln - Wad, Bog Iron Ore. Victoria County Tobique River - Red Jasper, Carnelian, Agate. At mouth, S. side - Galena. At mouth of Wapskehegan R. - Gypsum, Salt Springs. Three miles farther up - Stalactites (abundant). Quisibis River - [Blue Phosphate of Iron] (in clay). Westmorland County Bellevue - Iron Pyrites. Dorchester, Taylor's Farm - Cannel Coal, Clay Iron Stone. On Ayre's Farm - Petroleum, Asphaltum. Grand Anse - Gypsum, [Selenite] (large crystals), Apatite, (vide Gesner). Memramcook - Coal, [(Albertite).] Shediac - 4 miles up Scadouc R. - Coal. York County Harvey Settlement - Wad. Nashwaak River - Coal. Tay Creek - Coal. Pokiok River - Tin pyrites (in granite vein). Three miles from St. John River, in direction of Lake George - Stibnite ! [See note]. 9 In order to obtain a clearer view of the value of the mineralogical resources of the Province as thus far developed, let us take a glance at the more important facts to be deduced from the foregoing list. Many of the minerals noted in its columns are not of economic importance, and therefore will not receive any further notice. Serpentine and marble, both of which are largely used in ornamental work, are known to occur at many localities; but few of those which have been examined yield blocks sufficiently perfect to be useful to the manufacturer. Of such well known and widely distributed minerals as limestone and gypsum it is scarcely necessary to speak. Both, the former especially, are abundant in many parts of the Province. Heavy beds of limestone are common in the southern metamorphic belt, also on the Bay Chaleur. Unaltered deposits may be seen skirting the margin of the great coal field. Gypsum is confined mostly to the Lower Carboniferous series of King's, Albert, and Westmorland; but occurs also in the red sandstone district of the Tobique River. Chlorite or ""pipestone"" and Steatite or ""soapstone"" have been found at a number of places; but no deposit of the latter mineral, sufficiently large to be available for manufacturing purposes, has yet been discovered. Barytes, or ""heavy spar,"" has been met with only at a few localities, and not in any considerable quantity, unless we may except that in Sussex and a large deposit said to occur at Le Tete. This mineral is largely used in the manufacture of white paint, and also for other purposes. It resembles calcareous spar, but differs in cleavage and is much heavier. The only gem which this province has thus far yielded is that very common one called, according to its color, white stone or rock crystal, false topaz, and amethyst. Other varieties of this mineral, such as carnelian, agate and jasper, which are frequently used in jewellery, occur at several places. Garnet is reported from Waweig river, but it has not been found ""in situ"". All the tourmalines mentioned are of the ordinary black variety. It will be seen on examination of the catalogue, that all the metals in ordinary use as well as some others which are more infrequent, occur in this province. But of the commoner ones several have not been found in sufficient quantity to be worth extracting. Indications of tin were observed in the granite of the Pokiok river, by Dr. Gesner. Lead ore has been met with at Tobique River, Norton, Campo Bello, and other places, but not in sufficient quantities as to assure a profitable return to 10 the miner. Zinc blende is found at Campo Bello and a few other localities, but not even so abundantly as lead. This mineral is usually of a dark brown color, and is frequently associated, as at Campo Bello, with galena and copper pyrites. Several ores of copper, chiefly sulphurets and carbonates occur in various parts of the Province, but few of the mines opened in these deposits have been permanently worked. Those of Bathurst and Woodstock have been abandoned. But mining on a small scale is still continued at Salmon River and Le Tete, and experimental operations on the deposit at Simpson's Island have been commenced. Two ores of this metal have been newly added to the list of those already known to occur in the Province. These are the Suplhuret called copper glance, from Simpson's Island and cuprite, or the red oxide of copper found at Salmon River. Iron and manganese are the metals which above all others are most abundant. Heavy ore beds of the former are exposed at Woodstock, Nerepis Road, Bull Moose Hill, West Beach, and other localities referred to in the list. At the first mentioned place the ore has been worked for a number of years. Manganese occurs in greatest quantities and purity near the eastern terminations of the two metamorphic bands to which allusion has already been made. The earthy variety called Wad is also common. The mine near Bathurst which affords beautiful crystals of the grey oxide has been abandoned on account of the irregularity and unreliable character of the deposit. Operations, however, are still carried on at Sussex and Shepody. Of the precious metals, silver has been detected in some of the lead ores, in the ore of antimony near Pokiok, and in the copper ore of Simpson's Island, but only in minute quantities. Gold, so far as we are aware, is yet undiscovered; at least, there is no tangible evidence to show us that it has been found in the Province. If reliance may be placed on the results of the geological survey, the northern metamorphic band, the County of Charlotte, the region about the headquarters of the Tobique, and that part of the southern band which has not been shown to be of Devonian age, are the most promising districts for the gold seeker. The discovery of a rich gold field would undoubtedly give a great spur to the development of our Provincial resources, but, at the same time, would probably have a tendency to attract a lawless and reckless population. Seams of coal have been found at numerous localities within the great central area, covered by deposits of Carboniferous age. Few of these, however, promise to be productive. The unique variety found at Hillsborough has proved to be a mine of wealth to its owners. Operations have also been successfully carried on at the mines on Grand Lake for many years. But in no other part of the Province have beds of this mineral sufficiently large to attract the attention of capitalists, been opened. Those best qualified to judge (Drs. Robb and Dawson) of the productiveness of New Brunswick coal measures, gives us little reason to hope that they will yield stores of fossil fuel as large as, considering the extensive area which they cover, we might anticipate. Still the discovery of extensive beds is not altogether hopeless, for we should bear in mind that a great part of the area underlaid by these rocks remains unsettled and uncleared; and we may traverse parts of it for scores of miles through an unbroken wilderness. Although New Brunswick is not favored with the possession of mineral attractions so brilliant as some of her Colonial sisters, she is not altogether devoid of some solid advantages as the preceding summary will show. The many openings for the advantageous investment of capital, which are to be found in a young and flourishing colony is no doubt the reason why the abundant mineral wealth, with which bountiful Providence has endowed us, still remains undeveloped. As population increases, however, and our wants become more diversified, this source of a prosperous and remunerative commerce will receive the attention which it deserves. Already we see signs of the approach of such a period in the careful investigation which several newly discovered metallic deposits are receiving. [In these remarks I have endeavored as far as possible to occupy ground different from that taken up by Prof. L.W. Bailey in this valuable little publication on the mineral resources of the Province, as exemplified by the metallurgical collection of the University of New Brunswick; considering that a repetition of what has recently been made public would be superfluous.] Addenda. -Iron Ore of West Beach. - The bed of ore at this place inwhich the mine has been opened is included in the upper part of a large mass of coarse reddish-grey conglomerate, dipping to the S.E. at an angle of about 30ø, and distant a furlong from the shore. The pit or quarry from which the ore has been extracted has been opened in a bed of dark, reddish, brown hematite. One or more schooner loads have been taken away, and a quantity still remains awaiting shipment. The conglomerate is abundantly seamed with quartz containing scattered masses and veins of micaceous and specular iron in tabular crystals. Two or three miles eastward of the mine the iron ore again appears on the hill side. Here, however, three or four beds of ore (one of them 20 feet thick) are visible; and the associated rocks are different, consisting of beds of trap-ash, trap-ash slate, and talcomicaceous slate. The ore beds were not traced on the eastern side of Black River. Were it not for their variable thickness they might be sought for here with much probability of success. A continuation of the same rocks holds beds of limestone at Emerson's Creek, a few miles to the eastward. The facilities for working this ore are therefore, in some respects, unusually good, but no smelting operations have hitherto been undertaken. From its association it would appear that this ore was originally deposited in the state of a finely divided ferruginous mud, in a shallow sea and within the influence of active volcanoes. I hope to be able to show at some future time that the accompanying rocks do not possess the antiquity ascribed to them in the geological reports of Dr. Gesner, but are of a later date than the sandstones and shales of St. John, which have yielded such an abundant harvest of Devonian plants. [For the information regarding the two following localities, I am indebted to Edward Allison, Esq.] Copper Ore, Simpson's Island. -The vein of green carbonate (malachite) recently discovered, occurs in a small island, (not exceeding 100 acres in extent) about one mile south of Deer Island, andseven miles from Eastport. The island is composed of trap-rock, through which protrudes a band of slate, with nearly vertical layers, which extends across the island in an East and West direction; it being about four feet wide on the West side, and from ten to twelve feet wide where it terminates in a small cove on the East side of the Island. The copper lode occurs in this slate, and was discovered on the West side of the Island in a beach which extends (from high to low water) abut 400 feet. This beach is composed of rock covered with seaweed, except near high water mark, where it is shingle. The copper lode, where discovered, is about four feet wide, and about 150 feet from low water mark; it has been traced about

150 feet toward the shore and to low water mark. Several tons of this ore have been taken out and sent to Liverpool to be tested. A small sample sent some time since yielded 27 per cent of copper, and nearly four ounces of silver to the ton. The value of the ore as taken out is reported to be £27 stg. per ton. [Pieces of Copper glance (sulphuret of copper) were scattered through the Carbonate which forms the mass of the ore at the surface, and were found to increase when the evacuation was deepened. At a greater depth the ore probably consists of the former compound, as the carbonate seems to result entirely from decomposing agencies at work at and near the surface] - G.F.M. Antimony of York Co. -The vein of antimony recently discovered occurs in York Co., Parish of Prince William, about 20 miles above Fredericton, and is on the S.W. side of the river Saint John. The rise of the land from the river at this place is gradual, till the summit of the slope (about 300 feet high) is reached, when the ground falls away toward Lake George, and the Pokiok Stream. Near the top of the slope a band of primary rock, having a course about N.W. and S.E., protrudes through the soil, and is shown particularly where it crosses the highway. This band of rock contains the vein of antimony referred to. It was discovered in boulders evidently detached from this ridge, and upon uncovering the rock the antimony was discovered imbedded in it. The vein was traced about one quarter of a mile by trial pits, and probably extends further. It appears to be about two feet wide, with a dip to the North of about 45ø. The vein has not been penetrated to a depth of more than six feet. Samples of the ore have been analyzed by Drs. Hayes and Jackson of Boston - also by a person in Liverpool. The result differs

Sussex, 1/4 mile from church, on McReady's farm - 7 [Selenite !] (hexagonal xls. forming in the mud of a spring.) [There are two fine groups of crystals from this locality in the Museum of the Mechanics' Institute.] Eight miles from Station, on Dutch Valley road - [Manganite], Pyrolusite, [Barytes.] Upham - Brine springs.Four miles E. of Titus Mill - Gypsum Northumberland County Boiestown - Coal. Barnaby's R., opposite mouth - Coal. Chatham - Coal, Iron Pyrites. Newcastle - Coal. Queens County Grand Lake, at Grand Point - Fossil Trees, containing Barytes, Pyrites, Copperas. Salmon River, (on Crawford's farm) - Coal, Caly, Iron Stone, Pyrites, Copperas. Newcastle - Coal mines. Coal Creek - Coal, (formerly mined.) Long Reach, opposite VanWart's - Chlorite. Washademoak River - Coal, (2 1/2 miles from Long's Creek.) Few miles above mouth on S.E. of a small cove - Hornstone, Jasper, Chalcedony, Carnelian, Quartz Crystals. Restigouche County Belledune Point - Verd Antique, Serpentine, Iceland Spar! Dalhousie, near to - [Agate], Carnelian. Point le Nim - Coal. St. John County Carleton, near Falls - Red Calcite. Chance Harbour - [Calc spar] (deep red xls) in quartz veins, Chlorite (in argill and talcose state). Brandy Brook - Quartz crystals. - Epidote (Pistacite) and Hornblende in boulders. Black R. settlement. - [Quartz crystals], Chlorite, Calc spar, Copper Pyrites, Specular Iron !(tabl. xls) Little Dipper Harbour, on W. side - Barytes, quartz crystals, Amethyst (in compact greenstone). Moosepath - Schorl (crystals), Hornblende (crystals), Felspar (red), Muscovite, Albite (?) Musquash, on E. side, Harb. at entrance - Graphite, Pyrites, Copperas. At Shannon's - Serpentine, Verd-Antique, [Chrysotile.] E. side of Musquash - [Quartz crystals] (veins in conglomerate). Portland, [Crow's Nest - Serpentine,] Chrysotile, Steatite, Magnesite, Asbestos. [Drury's Cove] - Indurated Talc, Pyrallolite (?), Graphite, Pyrites.[At the Falls] - Graphite (impure bed 4 ft.) [Fort Howe Hill] - Graphite, Calcite (several forms, viz: dogs-tooth spar, nail-head spar, &c.) [Howe's Road], 1 1/2 miles from St. John - Epidote (in syenite). ! 1/2 mile from road [Tremolite], Steatite, Mica (?). [Lily Lake] - Serpentine, Chrysotile, Talc, (radiated), Steatite, Graphite. [White Augite] (?). Quaco, Light House Pt. - Manganese, ([Pyrolusite]), (bed 4 ft). W. of Point - Lignite. E. of Quaco, Fuller's Creek - Graphite, Iron Pyrites. Farther Eastward - Schorl, Asbestos, Chrysotile, Serpentine. Sheldon's Pt. - [Epidote] (Pistacite and Zoisite), Actinolite, Asbestos, Calcite, Specular Iron, Malachite. Cape Spencer - Specular Iron (crystals), Calcite (crystals), Talc, Chlorite, Asbestos. Ten Mile Creek - Coal in slate and sandstone. West Beach - At Evan's - Quartz Crystals, Talc, Chlorite. Half Mile W. of Evan's - Vein of Magnesite with Talc, Chlorite and Magnetic Iron, Copper and Iron Pyrites, [Hematite], [Specular Iron]. [See note.] Point Wolf and Salmon R. - Iron and [Copper] [Pyrites], Asbestos, Chlorite, [Erubescite], Chrysocolla, [Cuprite.] Sunbury County Oromocto River, N. Branch, 10 miles up - Coal. Lincoln - Wad, Bog Iron Ore. Victoria County Tobique River - Red Jasper, Carnelian, Agate. At mouth, S. side - Galena. At mouth of Wapskehegan R. - Gypsum, Salt Springs. Three miles farther up - Stalactites (abundant). Quisibis River - [Blue Phosphate of Iron] (in clay). Westmorland County Bellevue - Iron Pyrites. Dorchester, Taylor's Farm - Cannel Coal, Clay Iron Stone. On Ayre's Farm - Petroleum, Asphaltum. Grand Anse - Gypsum, [Selenite] (large crystals), Apatite, (vide Gesner). Memramcook - Coal, [(Albertite).] Shediac - 4 miles up Scadouc R. - Coal. York County Harvey Settlement - Wad. Nashwaak River - Coal. Tay Creek - Coal. Pokiok River - Tin pyrites (in granite vein). Three miles from St. John River, in direction of Lake George - Stibnite ! [See note]. 9 In order to obtain a clearer view of the value of the mineralogical resources of the Province as thus far developed, let us take a glance at the more important facts to be deduced from the foregoing list. Many of the minerals noted in its columns are not of economic importance, and therefore will not receive any further notice. Serpentine and marble, both of which are largely used in ornamental work, are known to occur at many localities; but few of those which have been examined yield blocks sufficiently perfect to be useful to the manufacturer. Of such well known and widely distributed minerals as limestone and gypsum it is scarcely necessary to speak. Both, the former especially, are abundant in many parts of the Province. Heavy beds of limestone are common in the southern metamorphic belt, also on the Bay Chaleur. Unaltered deposits may be seen skirting the margin of the great coal field. Gypsum is confined mostly to the Lower Carboniferous series of King's, Albert, and Westmorland; but occurs also in the red sandstone district of the Tobique River. Chlorite or ""pipestone"" and Steatite or ""soapstone"" have been found at a number of places; but no deposit of the latter mineral, sufficiently large to be available for manufacturing purposes, has yet been discovered. Barytes, or ""heavy spar,"" has been met with only at a few localities, and not in any considerable quantity, unless we may except that in Sussex and a large deposit said to occur at Le Tete. This mineral is largely used in the manufacture of white paint, and also for other purposes. It resembles calcareous spar, but differs in cleavage and is much heavier. The only gem which this province has thus far yielded is that very common one called, according to its color, white stone or rock crystal, false topaz, and amethyst. Other varieties of this mineral, such as carnelian, agate and jasper, which are frequently used in jewellery, occur at several places. Garnet is reported from Waweig river, but it has not been found ""in situ"". All the tourmalines mentioned are of the ordinary black variety. It will be seen on examination of the catalogue, that all the metals in ordinary use as well as some others which are more infrequent, occur in this province. But of the commoner ones several have not been found in sufficient quantity to be worth extracting. Indications of tin were observed in the granite of the Pokiok river, by Dr. Gesner. Lead ore has been met with at Tobique River, Norton, Campo Bello, and other places, but not in sufficient quantities as to assure a profitable return to 10 the miner. Zinc blende is found at Campo Bello and a few other localities, but not even so abundantly as lead. This mineral is usually of a dark brown color, and is frequently associated, as at Campo Bello, with galena and copper pyrites. Several ores of copper, chiefly sulphurets and carbonates occur in various parts of the Province, but few of the mines opened in these deposits have been permanently worked. Those of Bathurst and Woodstock have been abandoned. But mining on a small scale is still continued at Salmon River and Le Tete, and experimental operations on the deposit at Simpson's Island have been commenced. Two ores of this metal have been newly added to the list of those already known to occur in the Province. These are the Suplhuret called copper glance, from Simpson's Island and cuprite, or the red oxide of copper found at Salmon River. Iron and manganese are the metals which above all others are most abundant. Heavy ore beds of the former are exposed at Woodstock, Nerepis Road, Bull Moose Hill, West Beach, and other localities referred to in the list. At the first mentioned place the ore has been worked for a number of years. Manganese occurs in greatest quantities and purity near the eastern terminations of the two metamorphic bands to which allusion has already been made. The earthy variety called Wad is also common. The mine near Bathurst which affords beautiful crystals of the grey oxide has been abandoned on account of the irregularity and unreliable character of the deposit. Operations, however, are still carried on at Sussex and Shepody. Of the precious metals, silver has been detected in some of the lead ores, in the ore of antimony near Pokiok, and in the copper ore of Simpson's Island, but only in minute quantities. Gold, so far as we are aware, is yet undiscovered; at least, there is no tangible evidence to show us that it has been found in the Province. If reliance may be placed on the results of the geological survey, the northern metamorphic band, the County of Charlotte, the region about the headquarters of the Tobique, and that part of the southern band which has not been shown to be of Devonian age, are the most promising districts for the gold seeker. The discovery of a rich gold field would undoubtedly give a great spur to the development of our Provincial resources, but, at the same time, would probably have a tendency to attract a lawless and reckless population. Seams of coal have been found at numerous localities within the great central area, covered by deposits of Carboniferous age. Few of these, however, promise to be productive. The unique variety found at Hillsborough has proved to be a mine of wealth to its owners. Operations have also been successfully carried on at the mines on Grand Lake for many years. But in no other part of the Province have beds of this mineral sufficiently large to attract the attention of capitalists, been opened. Those best qualified to judge (Drs. Robb and Dawson) of the productiveness of New Brunswick coal measures, gives us little reason to hope that they will yield stores of fossil fuel as large as, considering the extensive area which they cover, we might anticipate. Still the discovery of extensive beds is not altogether hopeless, for we should bear in mind that a great part of the area underlaid by these rocks remains unsettled and uncleared; and we may traverse parts of it for scores of miles through an unbroken wilderness. Although New Brunswick is not favored with the possession of mineral attractions so brilliant as some of her Colonial sisters, she is not altogether devoid of some solid advantages as the preceding summary will show. The many openings for the advantageous investment of capital, which are to be found in a young and flourishing colony is no doubt the reason why the abundant mineral wealth, with which bountiful Providence has endowed us, still remains undeveloped. As population increases, however, and our wants become more diversified, this source of a prosperous and remunerative commerce will receive the attention which it deserves. Already we see signs of the approach of such a period in the careful investigation which several newly discovered metallic deposits are receiving. [In these remarks I have endeavored as far as possible to occupy ground different from that taken up by Prof. L.W. Bailey in this valuable little publication on the mineral resources of the Province, as exemplified by the metallurgical collection of the University of New Brunswick; considering that a repetition of what has recently been made public would be superfluous.] Addenda. -Iron Ore of West Beach. - The bed of ore at this place inwhich the mine has been opened is included in the upper part of a large mass of coarse reddish-grey conglomerate, dipping to the S.E. at an angle of about 30ø, and distant a furlong from the shore. The pit or quarry from which the ore has been extracted has been opened in a bed of dark, reddish, brown hematite. One or more schooner loads have been taken away, and a quantity still remains awaiting shipment. The conglomerate is abundantly seamed with quartz containing scattered masses and veins of micaceous and specular iron in tabular crystals. Two or three miles eastward of the mine the iron ore again appears on the hill side. Here, however, three or four beds of ore (one of them 20 feet thick) are visible; and the associated rocks are different, consisting of beds of trap-ash, trap-ash slate, and talcomicaceous slate. The ore beds were not traced on the eastern side of Black River. Were it not for their variable thickness they might be sought for here with much probability of success. A continuation of the same rocks holds beds of limestone at Emerson's Creek, a few miles to the eastward. The facilities for working this ore are therefore, in some respects, unusually good, but no smelting operations have hitherto been undertaken. From its association it would appear that this ore was originally deposited in the state of a finely divided ferruginous mud, in a shallow sea and within the influence of active volcanoes. I hope to be able to show at some future time that the accompanying rocks do not possess the antiquity ascribed to them in the geological reports of Dr. Gesner, but are of a later date than the sandstones and shales of St. John, which have yielded such an abundant harvest of Devonian plants. [For the information regarding the two following localities, I am indebted to Edward Allison, Esq.] Copper Ore, Simpson's Island. -The vein of green carbonate (malachite) recently discovered, occurs in a small island, (not exceeding 100 acres in extent) about one mile south of Deer Island, andseven miles from Eastport. The island is composed of trap-rock, through which protrudes a band of slate, with nearly vertical layers, which extends across the island in an East and West direction; it being about four feet wide on the West side, and from ten to twelve feet wide where it terminates in a small cove on the East side of the Island. The copper lode occurs in this slate, and was discovered on the West side of the Island in a beach which extends (from high to low water) abut 400 feet. This beach is composed of rock covered with seaweed, except near high water mark, where it is shingle. The copper lode, where discovered, is about four feet wide, and about 150 feet from low water mark; it has been traced about 150 feet toward the shore and to low water mark. Several tons of this ore have been taken out and sent to Liverpool to be tested. A small sample sent some time since yielded 27 per cent of copper, and nearly four ounces of silver to the ton. The value of the ore as taken out is reported to be £27 stg. per ton. [Pieces of Copper glance (sulphuret of copper) were scattered through the Carbonate which forms the mass of the ore at the surface, and were found to increase when the evacuation was deepened. At a greater depth the ore probably consists of the former compound, as the carbonate seems to result entirely from decomposing agencies at work at and near the surface] - G.F.M. Antimony of York Co. -The vein of antimony recently discovered occurs in York Co., Parish of Prince William, about 20 miles above Fredericton, and is on the S.W. side of the river Saint John. The rise of the land from the river at this place is gradual, till the summit of the slope (about 300 feet high) is reached, when the ground falls away toward Lake George, and the Pokiok Stream. Near the top of the slope a band of primary rock, having a course about N.W. and S.E., protrudes through the soil, and is shown particularly where it crosses the highway. This band of rock contains the vein of antimony referred to. It was discovered in boulders evidently detached from this ridge, and upon uncovering the rock the antimony was discovered imbedded in it. The vein was traced about one quarter of a mile by trial pits, and probably extends further. It appears to be about two feet wide, with a dip to the North of about 45ø. The vein has not been penetrated to a depth of more than six feet. Samples of the ore have been analyzed by Drs. Hayes and Jackson of Boston - also by a person in Liverpool. The result differs

S.J. Daily News - Feb. 12, 1872 ....The all absorbing topic at present is the Albert County Railway. The people appear to be desirous to get the road and the work will probably be commenced at an early day. The friends of the road point to the splendid resources of the County, the Albert Free Stone Quarries at Mary's Point, owned by the Estate of the late C.D. Archibald, Esq., the Stone Quarries on Demoiselle Creek, belonging to Messrs. Deveber (?) & Son, and those leased by Messrs. Albert Steeves and Blight, of Hillsborough and others, the gypsum found in the locality, the deposits of manganese at Hopewell, Baysideand Harvey, the copper mines at Alma, the extensive lumber lands yet untouched by the axe of the lumberman, the great agricultural capabilities of the County and the magnificent harbor at Shepody, and ask why a county possessing such advantages should be shut out from every other part of the Province. When the County has railway communication, money will flow in and its resources will be successfully developed."

Daily Telegraph - Aug. 7, 1880 Albert County. - ... Mineral Deposits. - Albert affords a fine field for the geological explorer, and the justly celebrated Hugh Miller would have found, here, many Schools and Schoolmasters to excite interest and stimulate his favorite study. Accepted theories might, however, be more disturbed than strengthened by a critical examination of the characteristics of this district. A considerable belt of metalliferous rock,follows the higher ranges from Shepody Mountain, westward to St. John County, and contains more or less of gold, copper, tin, iron and telluride - quicksilver has lately been discovered, the locality known only to a few, andasbestos is reported near the western line, a short wayfrom the Bay shore. Alma is the parish richest in metals so far as known, and the copper beds there have exchanged owners at high rates, though little has yet been done in working. Pockets of manganese may be seen at Waterside and Germantown in Harvey and in Hopewell, where theMessrs. Steadman expended $60,000 in erecting works for manufacturing chemical products from local deposits. Lime rock is plentiful in Elgin, Harvey, Hillsborough and Hopewell, and in the last named parish, a company is engaged in its burning and preparation for market. Marble exists in several places, but has not yet attracted the attention of capitalists.Very fine freestone is found all along the shore of the bay and on the Petitcodiac. Two quarries at St. Mary's and one at Curryville on the railway line are being worked at present. Gypsum of the best grade outcrops in many places.The rock is being exported from Hopewell, about 3,000 tons being now ready for shipment; and in Hillsborough the Albert Manufacturing Co., at present managed by Joseph T. Tompkins, Esq., has, since 1854, carried on a large business. The proposed capital was œ50,000, and, in this case, the objects of the original charter have been exceptionally well carried out, though always laboring under the disadvantage of the high tariff of the United States. The company has continuously afforded local work for a number of men at all seasons, and has greatly promoted the carrying trade. Railways have been built; a superior factory has been erected to replace the one burned; and, with the necessary equipment of wharves, stores, warehouses, etc., the company has added much to the appearance of the village. The excavating, road making, trucking, cooperage work, grinding, calcining, barrelling, shipping, etc., have for a number of years secured for Hillsborough a hum of which few villages can boast. The recent increase of 7 « per cent duty on imported calcined plaster has, perhaps, enabled the company to place larger quantities in the Canadian markets, whatever may have been the counteracting influences of the tariff regarding it in other directions. The Hillsborough Plaster and Railroad Company of 1851 has not continuously operated. Other valuable gypsum properties are held by Sir A.J. Smith and others. Of these James Blight, Esq., is local agent, and this gentleman, in fact, did a great deal of initiatory work in developing the business. Coal in limited seams may be seen in everyparish, mostly cannel of inferior quality, but the most important carboniferous deposit, yet discovered, lies in the interior of Hillsborough. This has long been called Albertite, and was first noticed, accidentally, by the Messrs. Duffy in 1848, was obtained from the Crown in January, 1850, a mining licence over a mile square, and their rights were shortly purchased for œ3,000 by a company, of whom the late Edward Allison, Esq., was the chief promoter. A charter was granted in 1852, and the noted lawsuit ensued between Henry Gesner, Esq., a proprietor of the soil, vs. the Albertite Mining Co. Wilmot, J., the late Hon, J.M. Johnson and Hon. J.H. Gray, now a B.C. judge, were among the counsel employed. The trial lasted several weeks, and the twelve jurors, who were instructed to determine and report, what the substance was, must have found their first lessons in geology rather tedious while listening to words of learned length and thundering sound, employed in the testimony as given by several of the most celebrated scientific men of the Continent. The substance had the chemical properties of coal, but the geological formation differed from all recognized theories. It differed from the Trinidad asphaltum in luster and fracture. The savants were evidently puzzled; but the jury said it was coal. A later conclusion, however, made it consolidated oil, and it is now known under the name of Albertite. Between costly litigation and unskilful management the net earnings were small till, in the person of John Byers, Esq., the company secured the services of one, who combined practical knowledge with executive ability. In one year about 15,000 tons were shipped, worth $15 per ton on the wharf. Latterly the export is less, as the drifts are at great depth, and the facilities for cheap working are becoming more impaired. It is hoped that further searches may restore confidence in the extent of this valuable article. Albertite is also found in minute quantities in Midland and other parts of Elgin and in Hillsborough, and it is known to exist in Hopewell in considerable quantities, by an old discovery; when its value was unknown, which late searches have failed to recover. The Princess Alexandra, East Albert and Prince of Wales companies, of which Mr. Blight is manager, have each expended large sums in freehold leases and prospecting work, but excepting the finding of comparatively narrow veins of Albertite nothing has resulted beyond the very useful employment of labor in the locality. In Rosevale and other districts are found large quantities of oil shale or bituminous rock, containing about 45 to 50 gallons of refined oil per ton, besides a residuum of pitch or asphaltum, making the whole volatile matter over 60 gallons to the ton. The oil is very pure and exceedingly valuable for illuminating purposes. Mineral oil exudes from the soil on McLatchey's farm in Hillsboro, and at Hopewell Hill, but the coming millionaire, who will first strike a flowing fountain, is not yet known, either to himself or others."

S.J. Daily Sun - Oct. 6, 1880 Minerals of New Brunswick. The Mechanics' Institute Collection of Useful Minerals. - One of the first objects which strikes the eye on entering the Exhibition Building by the main entrance door is the show case

displaying the exhibits of useful minerals of New Brunswick sent by the Mechanics' Institute. This includes the collections of ores and products of several mines which after the Exhibition will be permanently on view in the museum of the Mechanics' Institute. The lower shelf of this case contains three strongly contrasted groups of products. On the left arethe dark colored minerals of the Albert mine, which has long been famous as the source from which a mineral resembling coal in many of its properties and yet distinct from it has been obtained in paying quantities. Mr. Ketchum, the obliging manager of the works, has sent with the coal various objects of curiosity and interest which serve to illustrate its relations and mode of occurrence of the coal. There are specimens of brown shale in which the coal occurs in various conditions, some with fishes perfectly preserved; others with scattered fish scales; others again are specimens of shell in contorted layers and with glossy surface. There are also concretions resembling cocoanuts, each with some organic substance at the centre, as a fish or a scattered cluster of scales. Other specimens sent show how the albertite or coal intersects the layers of the shale and does not lie between, as would be the case with a true coal. Such fine samples and large masses of the coal as are presented to view in this case are now rarely obtained.On the right hand of the Albert Mine exhibit are displayed the products of the Albert Manufacturing Co., from the crude, snow-white gypsum to the finished vase of alabaster. These products (except the vase) came from Mr. Tompkins, the manager and part owner of the property. Various grades of the plaster rock cut into blocks of convenient form and size, serve to show the nature of the mineral on which Mr. Tompkins operates. Then in a set of glass bottles are shown the products of the factory. First samples of calcined plaster for use in dentistry, etc. Samples of raw ground gypsum are also shown in two varieties, one for agricultural purposes, the other for use in the arts, this latter being the variety known as terra alba. A small quantity of each preparation of the powdered mineral is placed on blue paper to make the shade of color more distinct and to prove its purity. The second and third shelves of this case are occupied by specimens of useful minerals brought from the museum of the Mechanics' Institute. The utility of these is partly illustrated by objects of art made from them. The metals are shown here in great variety, there being ores of iron, lead, antimony, molybdenum, manganese, copper and zinc, some from mines that have been worked, but are now abandoned, and others from mines that have been in operation for many years. Many varieties of copper ores and ores of iron and manganese ores are here displayed. Various spars and minerals of non-metallic lustre are also present, most of which are of importance in various processes in the arts. Some for ornament as agates, carnelian, serpentine, and marble. Others that have been useful to the aboriginal inhabitants of the Province of New Brunswick for weapons and tools, as quartz and chlorite and jasper. Others again which their successors now make use of for the various purposes of modern life, as heavy spar and mica for optical purposes. Marble chalcedony and rock crystal for ornamental uses. A third group of specimens in this collection includes the combustible minerals, such as peat, albertite, bituminous coal and anthracite. Perhaps the most varied series of specimens fromany mine contributed to this collection is that furnished by the Hon. Francis Hibbard, the product of the Lake George Antimony mine. Mr. H. has begun at the foundation and sent specimens of slate or country rock, in which the veins of antimony are found. Then he has also a sample of the ore, showing the vein stone (quartz) mixed with ore. Three grades of the ore as it is taken out of the vein are also exemplified by specimens. Coming after these are three samples of the crushed ore separated from the quartz and mud by screening and washing. This ore is deprived of its sulphur by roasting, and is then passed into the smelting furnace. Samples of the fluxes, salt cake and rosin, and of the charcoal used in smelting, are present with this exhibit. In smelting a vapor passes off, which is condensed in the chamber connected with the furnace, being the oxide of antimony. This is exhibited in two varieties, one cream colored and another not so pure and of a darker shade. The final products are shown by two examples, one of slag resulting from the smelting, the other the regulus (or metal) of a metallic aspect and peculiar fracture. Opposite to Mr. Hibbard's collection is oneshowing the anthracite coal of Lepreaux and its associated rocks. Although not as pure a variety as might be desired, this is a true coal, lighter than the English cannel, but of a peculiar granular texture that causes it to crumble easily. It is of much interest as being the only workable coal known of so great an antiquity (being a product of the Devonian age). The shale associated with it presents the same glossy surfaces as those seen on the shale of the Albert Mine in the lower part of the case, but while this is brown, the shale of Lepreaux is black, and to the uninitiated seems the more valuable part of the product mined. The country rocks associated with the Lepreaux anthracite are fully shown by the specimen that accompanied it, and are of the same kind as the rocks which may be seen on the shore near the Exhibition Building. There are the same grey sandstones and grits (Dadoxylon sandstones), which form the point outside the railway terminus; these underlie the coal. And there are also the red slates (Cordaite slates), which may be seen in layers with green slates a short distance further east along the shore, in front of the Exhibition grounds. At Lepreaux these slates have limestone with them, and this is shown by a sample sent by Mr. G.K. Hanson to whom the Exhibition is indebted for all the specimens received from Lepreaux. ...... Between the Lepreaux and Hibbard exhibit is a collection of pieces of galena bearing quartz said to beargentiferous, received from Mr. Wannamake, St. Martin's, and perhaps from hills on the south side of Hammond River. Beyond the case in which these various collections are placed, are other cases of minerals which we propose to describe in a future issue."

S.J. Daily Sun - Jul. 15, 1881 [and similar version in Daily Telegraph - Jul. 15, 1881] Educational Institute. - Addresses by ... Mr. G.F. Matthew ... - Useful Minerals of New Brunswick. - ... Prof. Burwash, of Sackville, was received as an honorary member on the floor of the Institute... New Brunswick's Useful Minerals. - Dr. Rand then introduced G.F. Matthew, Esq., A.M., who delivered an interesting address on Useful Minerals of New Brunswick. Mr. Matthew said the first Europeans who settled in Acadia found themselves in a country abounding with game and fish and almost too well wooded. As the lumber resources were diminished the people were led to turn their attention to the products of the mine. The increase of manufactures in our midst will no doubt causea greater demand for our minerals and greater knowledgeof them will be of value. He would first give a sketch of the useful minerals of New Brunswick. In describing theuseful minerals he did not purpose to confine himself to the simple minerals, but to describe as well the variouscompound and impure substances of mineral origin, orcomposition, which are available for economical purposes.In this connexion various earthy deposits and rocks whichhave an homogenous structure will be noticed. There are anumber of these mineral species, which from theiroccurrence in large masses, or as being more valuable than others, are worthy of a place among the economical minerals; and among these the ores of metals hold a prominent place. Our knowledge of metals has grown up of late years, our ancestors knowing nothing of them. The occurrence of these metals in New Brunswick would be still unknown were it not for the researches which have given to modern chemistry the power to analyze and pick them out from their combinations. Prominent among the metals of vital importance to the community is iron. Ores of this metal are known to exist at several localities in New Brunswick but only those of Woodstock have been largely mined and smelted. The Woodstock ore is chiefly of the hematite species, and extends from Aroostook County in Maine to and across the St. John River into Peel parish of Carleton County. About 40,000 tons are said to be smelted in Woodstock Iron Works. Some of the iron ore beds of this district contain a large percentage of manganese. Similar manganese iron ores are found at Markhamville, King's County, and at West Beach, St. John County. A kind of iron ore which is a secondary product, resulting from the decomposition of other iron ores, is called bog iron. This ore is found in thick beds, especially in the carboniferous districts of York, Queens and Sunbury. Magnetic or black oxide of iron is a third ore of this metal, while a fourth one is thecarbonate. Beds of this latter ore have been found in the coal measures of Queens County and elsewhere. The fifth ore, which occurs in many places but usually in small quantities, is the sulphuret of iron. At Moore's Mills, Charlotte County, it is quite extensively found. The pyrites at this place is intimately mingled with calcite and the deposit extends in an east and west direction for several miles. Another metal occurring in large quantities in New Brunswick is manganese, which is extensively mined at Markhamville, King's County. Manganese ore is found in three other places - at Quaco, Shepody mines, and near Bathurst. The copper ores of New Brunswick are mostly sulphurets, but for some reason this mining industry has not had a healthy or continued growth. Adams and Simpson's Islands and La Tete peninsula in Charlotte Co. and Salmon River in Albert Co. are the most promising places for copper mining. Galena or sulphuret of lead is the only metal of this kind in New Brunswick that is worthy of mention. It is an ore that in this region silver is often associated with. Zinc ore is not common in this Province but has been found in small quantities - at Campobello and La

Tete in Charlotte Co. Antimony, a rare metal in most countries, is not uncommon in this. It is known to exist in at least four places among which Lake George in York Co. is best known, where operations have been carried on since 1862. Much of the ore is reduced at the mine and converted into metallic antimony. Among the minerals that occur in largequantities are gypsum and limestone. One of the most extensive quarries of gypsum is at Hillsboro. Some of the rocks are as white as snow. At Petitcodiac there are also large beds of gypsum, where it has a breadth of 40 feet, and is laid bare for a mile. Limestone and marble occur at many places in New Brunswick. Pure white crystalline marble and verd-antique marble are found in Portland, St. John County, and variegated red marble at Gagetown,Queen's Co. Of combustible minerals, four kinds in thisProvince are worthy of notice. Bituminous coal has been discovered at various places, and has been mined at"

St. Andrews Standard - Jan. 12, 1870 From the Canada Year Book for 1870. NEW BRUNSWICK No mines of gold, silver, lead, tin, or other metals nor here under mentioned, are now being worked in New Brunswick. Iron is being raised and smelted to a limite dextent at Woodstock. There are no other iron mines worked, though available ores occur at other points. Copper - With the exception of a mine at Adam's Island, in Charlotte County, owned and worked by an English Company. ""The Casco Bay Mining Company"" - who still employ about thirty men, all the New Brunswick copper mines have been, for the present, abandoned. Manganese is being profitably worked at the ""Markhamville Manganese Mines"" in Upham, Kings County.Thirty men are employed, and the number is to be increased. In 1867-8, the trade returns show that New Brunswick exported 861 tons, valued at $19,019. Plumbago has been removed from two localities. From the first, at Portland, Saint John, 2,000 barrels, of 308 lbs each, have been taken. From the second at the Falls, Suspension Bridge, St. John, called ""The Split Rock Plumbago Mine"", - Mr. A. Garrit, director, - some twenty-five barrels a day are being taken out. Coal is now being mined in two localities only, the Albert Mine, near Hillsborough; and the mines at Newcastle Creek, Grand Lake. - It is doubtful whether the Albert coal is coal at all. Better to call it Albertine. Salt is being manufactured on a limited scale from brines near Sussex. The product might be much increased by judicious management. Lime is burned to a considerable extent at the narrows of the St. John, at the Green Point Quarries, &c.; on a limited scale at many other points. Plaster is quarried and calcined for exportation at Hillsborough. Almost all the above information has been furnished by Professor W. Bailey, of Fredericton."

Kings County Record - Feb. 15, 1929 Should Stimulate Mining Activity. - Locations of Areas in Kings County Where Prospecting is Now Being Carried Out. - Geological Formation Explained by Mr. H.G. Wildman, of C.N.R. - The following details of the mineral resources of Kings County are culled from an extensive report of New Brunswick mining activity prepared by Mr. H.G. Wildman, mineralogist of the Canadian National Railways. He writes in part as follows: It is a matter of common knowledge that the deposition of minerals is more likely to occur in certain series of rocks than others. It therefore follows that, in dealing with the subject, it is necessary to pay some regard to the simple aspects of the geology of that area under consideration. The province of New Brunswick embraces an area of 27,985 square miles which may be roughly classed in three divisions, as follows:- (a) The northern section, the New Brunswick Highlands, a series of granitic hills, which may be said to commence with Mars Hill, situated near the Maine border, in the county of Carleton, rising 1,650 feet above sea level and forming one of a series of numerous peaks extending to the Baie de Chaleur to the northeast, having an average width of about forty miles. (b) The low-lying region in which is found the coal district of Chipman and Minto. This basin is remarkably uniform in its height above sea level, averaging in the neighborhood of 185 feet. There is, however, a slight rise near Coal Creek of 259 feet. (c) The plateau, surmounted by a range of hills, extending through the counties of Charlotte, Kings, Saint John, to Albert and Westmorland. The highest of these peaks is the Chapel on the road to Sussex Vale, which has an elevation of 1,140 feet above sea level. The whole country has been more or less glaciated, the ice, on its recession, having left a heavy covering of drift and boulder clay which to a large extent conceals the rock formation, this condition, together with the very general dense brush, renders prospecting extremely difficult. An overburden of 20 feet is frequently encountered. The general contour of the country has little changed since the Pre-glacial Period. The larger riversfollow virtually the same course as that along which they flowed prior to the advent of the ice. At the same time, areas are to be noted where changes have occurred in the surface of the country and the filling of the then channels by glacial drift have caused new channels to be cut through the surrounding country. There is abundant evidence of a greater elevation in relation to the sea level in early times, which caused the rivers to cut deeper channels due to the erosive action of swiftly running waters. From the Bay of Fundy, in a northwesterly direction, the topography of the county is characterised by a series of elevation and depression having a general northeasterly direction - a height of land stretching through St. John and Albert counties paralleled by a depression forming the valley of the Kennebecasis. The adjoining highland of Kings County include Jordan and Keirstead Mountains and other similar elevations of the series extending nearly to Moncton, paralleled by other series of highlands and lowlands across the province to the Quebec boundary. Antimony. - In the autumn of 1927 information reached this Department of a discovery of stibnite float over an area of about one mile in the Mountaindale (Marrtown) district. As a result of our investigations Messrs. R.G. Heughan and Company, and other independent parties in Montreal, were led to stake most of this area. Some development was carried on during the past summer on the Heughan and Brown stakings. No stibnite was found in place until September 1928, when a small stringer was discovered on the Heughan property. It is proposed to follow this up in the spring of 1929 as a large mineralized zone is indicated in the district. A reported discovery of stibnite at Stewarton, during well sinking operations was investigated. It was stated that two feet of stibnite was penetrated during the work but this statement could not be confirmed, owing to the well being full of water. There was no apparent surface indication of such an occurrence, but a thorough investigation will be made in the spring of 1929. Arsenic is found at Bellisle, in a very narrow veins in a basic lava. Copper. - Annidale, situated midway between Annidale and Scotch Settlement is the copper property now being developed by the Annidale Copper Mining Company Ltd., as the result of recommendations made to them by this department. Here a number of test pits have been sunk and a few carloads of ore shipped. The main shaft has been located between two outcroppings of mixed chalcopyrite and pyrite, averaging 7 p.c. copper, and has already attained a depth of 108 feet. It is the intention to drift on to both veins and a further program of diamond drilling is to be mapped out. At Irishtown, about five miles east of Annidale there is a nice showing of chalcopyrite, upon which no work has been done. On Jordan Mountain a considerable amount of work has been done disclosing a body of copper carbonate of low grade. Similar exposures of copper carbonate are noted at Goshen, to the southeast, where Consolidated Mining & Smelting Company have been diamond drilling. Gypsum. - At Upham, there is a very large depositof high-grade rock which lies contiguous to the Canadian National Railways line between Hampton and St. Martins, and about 25 miles from the sea. Five hundred tons of gypsum was shipped from this property in 1905 when the shaft was invaded by water from the river. Another very promising deposit is found adjacent to the main highway between Sussex and Apohaqui. It is very white in color and remarkably free from anhydrite. Manganese. - At Markhamville, eight miles southof Sussex, the mineral occurs in a grey limestone and is reported to have been the largest producer of manganese in New Brunswick, having shipped 30,000 tons some years ago. There is a considerable extension of the ore-bearing formation in which other bodies may be found and offers a promising area for the energetic prospector. Two assays of ore from this vicinity gave the metallic content as 44.65 and 42.77%. The property at Jordan Mountain is about six miles north of Sussex and has been worked by a trench 75 feet in length in what appears to have been a pocket of high-grade ore. Several hundred tons have in the past been shipped to the smelter. The property is now owned by J. Starr Tait, attorney, of Saint John, who is endeavoring to interest American capital in its further development. A selected sample from the district assayed 59% manganese. Near Jordan Mountain, shales, similar to those in Albert County, are found again near Sussex are two smallareas. Salt. - The occurrence of salt in the Carboniferous area of southern New Brunswick has long been known, a small operation having been carried on by George Hendricks, east of Sussex, in 1887, which was apparently the first commercial plant for the production of salt in the province. Saline springs occur in several places along the valley of the Kennebecasis and Sussex Vale, notably those at Upham and Anagance, an analysis of the former giving sodium chloride 1293.648 grs. per imperial gallon, that at Anagance having a similar saline content. The potassium content of these springs is low."

Moncton Daily Transcript - Oct. 2, 1888 The mineral possibilities of New Brunswick are greatly underestimated; and the time is not far distant when, as a source of wealth, they will be energetically developed. The statistics of output of minerals last year, are imperfectly collected, and no adequate conception of the output is at hand. The statistics collected by Mr. Eugene Coste, of the geological survey, such as they are we give. He places the mineral output in New Brunswick last year at the following rates: - Quantity ValueGrindstones... 3,582 tons $38,938 Arsenic... 100 pounds 4 Coal... 10,040 tons 23,606 Copper... 2 tons 200 Graphite... 300 tons 2,400 Gypsum, crude... 29,102 tons 29,266 Manganese... 939 1/2 tons 21,260 Granite... 6,289 tons 15,125Building stone (3 returns)... 6,871 cubic yards 52,901Lime... 478,410 103,463Brick, thousand... 6,476 43,454 -- Total value... $330,667 The estimate is altogether too low. The output of grindstones and building stone are absurdly low. The output of granite is placed at $15,125, whereas $100,000 worth is known to have been shipped to the western provinces. The matter is an important one, and the bureau of statistics should make some effort to

Daily Times - Aug. 23, 1890 Osman letter - (unreadable) ...... re National Improvement Co. and Tompkins......"

Daily Times - Aug. 27, 1890 The Albert Manganese Property. - Editor Times. - In your valued paper of the 20th inst., which I have unfortunately only just seen, there is an article by A.D.J., in reference to the manganese mines at Dawson Settlement and the Salisbury and Harvey Railway. A.D.J. has been somewhat misinformed, and the article in point to be regretted as tending to create illfeeling between the parties concerned. The manganese mines are owned by the Crimora Manganese Co., not by the National Improvement Company, although the proprietors are in the two instances nearly the same. Of course the legal proceedings commenced by Mr.Osman must be settled, and the ownership of the railroad determined before the contemplated extensive improvement at the mines can be fully completed. Messrs. Tompkins and Osman have both reportedly offered their advice and services in the kindest manner in connection with our own work in Albert Co., and I am desirous, if possible, that the existing legal proceedings shall not be used to disturb or prevent friendly relations, or to unfairly present these gentlemen to the public. The manganese property will be worked irrespective of the ownership of the railroad, and I trust you will find space to give this correction insertion. Hastily and truly yours, C.H. Harman, President of the National Improvement Co."

Moncton Daily Transcript - Jul. 31, 1890 Albert County Minerals. - Developing Manganese Property, Another Discovery of

Albertite Coal. - Hillsboro, July 31, - [Special]. - On Saturday there are expected at Hillsboro, via Salisbury, four gentlemen from New York, three from Philadelphia and two from London, Eng., who are coming to the county to inspect mineral properties. The steamer Arbutus has been hired to take them on Saturday evening from the Hillsboro wharf to the ship railway, which they will visit. The Manganese Mining Company have commenced to build their kilns, five in number. S.D. Day, a mining engineer from Virginia, who is to be mechanical superintendent, has arrived and has charge of the works. The Company expect to make their first shipment in about a month's time. Last Thursday, at the plaster quarry, they struck a new vein of very fine plaster, of the quality superior to any yet produced. About a week ago, the farm of Ralph

Codes: 0707 / HILL / IDX_Names:Dawson Settlement; Grey Brook Gypsum;
Daily Times - May 16, 1890 and Daily Telegraph - May 17, 1890 Manganese Mining in Albert County. - Says the Maple Leaf's Dawson correspondent: The purchasers of the manganese mine have decided to commence work at once. The managers of the company are here, and are procuring men and teams and making preparations for active operations. They are making arrangements for the building of a branch railway about 1 « miles long to connect the mine with the Albert line. When the work gets fairly started the company will probably employ about 200 men and quite a number of teams. This, together with the smaller amount of work furnished by the Albert Manufacturing Co., will make times quite lively in the

Daily Times - Sep. 2, 1890 An Albert County Matter. - Letters in Reply to Mr. C.J. Osman - The National Improvement Company and the Albert Railway. - ...."

S.J. Daily Sun - Nov. 5, 1891 Albert County. - ...The Hillsboro plaster industry is one of the great feeders of the road, and if satisfactory through rates for rock plaster, which is now exported to Newark by water, could only be secured from connecting roads, the freight business of the Salisbury and Harvey line would be the gainer by something like one hundred tons per day for every working day in the year. ...The manganese mines of the National Improvement Co. of New York, C.H. Harmon president, which are situated about eight miles from Hillsboro, have unfortunately been closed down for some months, owing to a legal squabble over the ownership of the property. But seven carloads of the crude material have been shipped this season. The New York company have spent a great deal of money there for plant, buildings, etc., and have built a railway one and a quarter miles long to connect the mines with the main line, and are confident that when the legal battle is ended they can make a handsome revenue out of their investment. At present the works are in charge of a watchman, who has resided there all summer. If the mines are developed to any considerable extent they will form an important feeder to the Salisbury and Harvey railway. ... Hay sells in Hillsboro now for $10 per ton.... The horses employed in connection with the plaster works absorb considerable of the Hillsboro cut."

City Gazette - Oct. 20, 1827 and Miramichi Mercury - Nov. 6, 1827 Minerals and Mineral Springs. - We have the satisfaction to lay before the public, a list of valuable Minerals and Mineral Springs, situated in King's and in Westmorland Counties. For a knowledge of their several localities, as well as for the discovery of most of them, we are indebted to a Gentleman of this City, who has lately spent a considerable time on an exploring excursion. To most of our readers it will be interesting, and to all a novel fact, that no less than three Hepatic (sulphureous) Springs, of the same nature and medicinal properties of the Harrowgate waters, have been found, and analysed - thus laying open infallible fountains of health, in many cases of disease. We hope that some excitement will continue to be kept up, on the Mineral resources of the Province. The present successful attempt will, doubtless, encourage further exploration, and we look sanguinely to a period, when Mining operations will be ranked among the lucrative branches, to which the industry of our people will be directed. 3 King's County.Kingston Hematite (a crystallized species of Iron Ore). Daily Telegraph - Feb. 22, 1878 Albert Sketches. - .... Riverside .... Gypsum and manganese are found in its neighborhood, althoughthey have not been worked yet to any advantage. Good building stone (sandstone) is met with in abundance behind the village. .... The chief business going on at Hopewell Hill justnow, is the work at the gypsum mine. This mine is situated about two miles from the village, on the bank of a small lake called Silver Lake, from which the gypsum takes its name, being called in the United States markets, Silver Lake plaster. It is of the best quality, being almost perfectly pure and free from lime, with which it is often found associated elsewhere. At present there are about forty men employed in digging it out and hauling it. It is first blasted into lumps which one man can handle readily, it is then hauled some three miles and a half to a landing on the Shepody River, where it lies till spring. It will then be shipped to the States. From twenty-five to thirty teams are at work every day hauling it. It will cost, when put aboard ship from 90c. To $1.00 per ton, freight to Boston from $1.50 to $1.75 per ton. The owner of the mine intends to get out 4000 or 5000 tons in the winter months that it can be worked advantageously. There is also a manganese mine in theneighborhood of Hopewell Hill, which was worked some years ago, but has since been abandoned, although the quality of the mineral is aid to be excellent. Hillsboro ...... The chief business carried on here is the preparation of of gypsum by the Albert Manufacturing Company. Their works are closed in the winter. The mine from which the gypsum is obtained is about 2 miles behind the village.The Albert Coal Mines, situated about 5 miles from Hillsboro, are also the means of circulating a considerable amount of money here. ...."

Weekly Record - Fri. Jun. 16, 1893 Charters letter #3 (extract below) .... The mineral displays from Ontario, Quebec and British Colombia are certainly fine and deserving of the highest praise. To the dismay and disgust of all Nova Scotians the mineral exhibit from that province is mean and unworthy: from New Brunswick nothing was expected, as the Local government did not take any active part, but in Nova Scotia it was understood the government had enteredinto the spirit of things vigorously and liberally and of all other objects the mines should have had a splendid showing. As it is, while quite a few minerals have been sent forward, nothing massive was forwarded to denote the vast coal, gypsum, iron and gold wealth of the province. It is much to be regretted so poor a showing has beenmade. From New Brunswick the Albert Manufacturing Co., have sent a tasty exhibit of ordinary and alabaster plaster, which causes much attention. The manganese ofMarkhamville and Jordan Mountain; the freestone from theMiramichi stone quarry near Newcastle; the magnetic iron,gold and silver and copper ores from Messrs. Payne &Ellis, of Bathurst, all have occasional inquirers. Smith's mineral water from Apohaqui is also here, but there is as yet no systematic showing of it. In a stone jug tightly sealed up, its virtues will probably never be known, unless John has some one to open it out to the admiring gaze of the

public. I might say the shaft and bases representing the gold yield of Nova Scotia causes much comment. The statement thereon shows that up to 1893 the quartz crushed was 762,036 tons, and yielded in gold 551,000 ounces, or something over eleven millions in gold. To be more correct and account for stolen gold, and gold obtained on which the government never received any royalty, about one-third more should really be added to this total...."

S.J. Daily Telegraph - Dec. 16, 1881 Valuable Milling and Mining Property. - Millowners, lumbermen and others, should bear in mind the great Equity Sale of Timber Land, marsh and farm lands, Plaster and Freestone quarries, copper mines and privileges, at Martin's Head, that is to take place at Chubb's Corner, on Monday next, 19th Dec."

Codes: 2027 / E5 / GYP / Y1 / LIME / D7 / IDX_Names:Bull Moose Hill Iron; Sussex/ Plumwesweep Salt; Gypsum; Salt Springs Salt; Lime - General; Kings County Coal;

Daily Telegraph - Aug. 13, 1880 Kings County. - ..... Coal. - Some search has been made for coal, but hitherto with only partial success. Some loads of bituminous coal, closely resembling that of the Springhill mines, has been mined quite near the surface on the lowlands near Stone's Brook, at Dunsinane mills. Specimens of unmistakeableAlbertite were found some years ago in Mechanics' Settlement, and some land property changed hands at a good valuation in consequence, but the discovery was not further developed. More recently, Albertite has been discovered on the lands of Mr. George Teakles, at the head of South Branch, Cardwell, and a considerable effort has been made to test its value. Salt has been manufactured on a small scale for agreat many years beside the old Post Road, and midway between Penobsquis and Sussex. The manufacture is carried on by Mr. Mercer, the lessee of the property, by boiling in iron boilers, producing ten or twelve bushels a day, we are told. The excellent quality of this salt for dairy purposes is so well established that good butter makers in the vicinity will have no other, even though they may have to pay double the cost of other salt for it. Purchasers of butter in the city also not infrequently inquire as to what salt butter which they propose to purchase is preserved with, a preference being given, whether on real or imaginary grounds, for butter flavored with Sussex salt. Of several natural brine springs in the county only one other has yet been utilised. This is located at Salt Springs Settlement, Upham, some three or four miles distant from the St. Martins and Upham railway. The spring is a remarkably large one, and the salt produced a few years ago was apparently of equal excellence with the Sussex salt. The works are now out of repair and idle. There are here some remarkable indications that the salt deposit is not far from the surface, as in several places the earth has settled and fallen in, in some spots quite recently, which is believed to be occasioned by cavities underneath formed from the dissolution of the salt, which finds it way to the surface in the brine of the spring. It is not probable that the manufacture of salt will even be productive of large profit until a stronger brine or the rock salt itself is reached by boring as is done at Clinton, Seaforth and Goderich, Ontario. Salt is there very largely and profitably manufactured out of brine formed in the salt beds a thousand feet deep and pumped to the surface, boiled in immense boilers 120 feet long and 20 feet wide. There is good reason to believe that salt would be struck at half this depth at some points in Kings if borings were made and that the venture would prove a highly profitable one if undertaken. Plaster, etc. - Among other economical mineral products are plaster orgypsum, which is found in several sections of Kings and has proved an excellent fertilizer. Notwithstanding that it is native to Sussex there are still extensive importations of plaster chiefly from Petitcodiac. Lime stone crops out extensively in almost every section of Kings. Kilns for burning it are also quite numerous, including a large one on the farm of Mr. Wm. Pugsley atSussex. Lime is coming more and more into use as a fertilizer and with excellent results. Iron ore of excellent quality was reported yearsago as existing at Bullmoose Hill, in Springfield, and bog iron in several localities near Sussex, but as yet nothing has been done to develop their value."

S.J. Daily Sun - Sep. 20, 1879 Martin Head... Here in 1806 resided the Messrs. Hazen, and the ruins of the cellar of their house are yet visible. Not far from the point where their house stood is a plaster quarry which they worked successfully by means of a tramway from the place of excavation to that of loading. The low point of which I speak is at present occupied by Mr. Walton, who resides there and has a portion of land under cultivation. The rock underlying this is of the sub-carboniferous period. In it may be seen a very small vein of coal. Mr. Walton says that there is visible at extremely low water on the shore, not far from this, a bed of lignite or brown coal, among which are fossil shells. A vein of copper ore, principally Bornite, occurs in the older rocks at the mouth of Quiddy river. This, Mr. Walton says has lately been inspected by a mining engineer, who has also leased a vein of copper ore not far from Salmon River."

Codes: E5 / HILL / Z2 / J8 / E2 / GEOL / IDX_Names:Sussex/ Plumwesweep Salt; Grey Brook Gypsum; Sandstone, Building Stone, Monument Stone, etc.; Albert Mines; Oil and Gas - Kings Co.; Geology - General;

Morning News - Nov. 21, 1855 Geology of New Brunswick, &c. - At a recent meeting of the Boston Society of Natural History, held in this city, some interesting reports were submitted, a portion of which related to the Geology of this and the adjoining Province of Nova Scotia. Those who have an interest in the development of the mineral resources of the Provinces, will be gratified to see that we have within our borders a field for investigation, and whichit seems has attracted attention. From the Boston Traveller, which contains an account of the meeting referred to, we learn that a variety of mineral specimens were laid before the society, as the products of this Province. Among these were two very pretty fossil star fishes, which were presented by Robert Foulis, Esq., of this City, a corresponding member of the society. They were obtained from the postpliocene marls near the gas works, and in return the unanimous thanks of the Society were voted to Mr. Foulis for this and several other donations. During the past summer, Dr. C.T. Jackson was employed by C.D.

Archibald, Esq., of London, to make Geological explorations in those provinces. In company with John L. Hayes, Esq., of Washington, the Doctor 8 commenced his search at St. John, and traced rock formations hence along the road leading to Petitcodiac. At the meeting referred to, Dr. Jackson gave a brief sketch of the Geology of New Brunswick and Nova Scotia, and described some of the species of rocks found in these Provinces. We condense his remarks. In St. John, he says, ""we found slates and metamorphic limestones, which, from the occurrence of them of a bed of hard sandstone containing a fossil tree, are regarded as belonging to the Devonian group. No molluscs, or indeed any fossils, are found in the limestone, which is made up of a mixture of the blue and grey varieties, highly metamorphosed by heat, and much disturbed in their stratification. Masses of Sienite, consisting of flesh-colored feldspar and hornblende, without much quartz, are observed at Indian Town, and are rocks of igneous origin. All along the Kennebecasis river, are observed red sandstones of the old red or Devonian group, and atSussex Vale we come to the celebrated salt springs, which rise from the saliferous sandstones, and produce by evaporation the finest and most agreeable table salt. In Hillsboro' we find the lower members of thecoal series, so remarkable for the abundance of fossil fishes of the genus Paleoniscus, and for that highly bituminous quality of coal which has been called Albertite. Hills of snow white gypsum, and some extensivebeds of Anhydrite, occur in Hillsboro', and in otherparts of Albert county. Naptha Springs also exist near the shores of the Petitcodiac river, and Petroleum floats on the surface of the waters that arise from them, and is deposited as a soft bitumen among the grass roots, and in the soil, it being left in its thickened and oxidized state by the water, as it periodically rises and falls with the seasons. On reaching the mouth of Chepody Bay we come to Mary's Point, and Grindstone Island, where beautiful buff-colored, and light red sandstones, of the Carboniferous Group, are quarried for building stones, and a blue variety of the same formation which is used for making grindstones is found. The Mary's Point quarries present a scene of activity, owing to the enterprise of Mr. Archibald, who has employed upwards of seventy-five quarrymen, under the directions of Mr. George Lang, in quarrying out the freestone for architectural uses. - Those sandstones are found to be of excellent quality for building purposes, and are now being largely imported into the United States under the Aegis of the reciprocity Treaty between the United States and Great Britain. Mr. Alger has demonstrated the durable nature of this sandstone, before this society, and our observations authorise us in confirming his opinion, that it withstands the action of the frost even in the climate of St. John. The largest amount of the stone is of a yellowish 9 tint, or buff-colored, but there are also beds of lightred, and grey-colored varieties. They belong to the true coal bearing strata, as is proved by the fossil plants clearly impacted between the beds of stone, and thin seams of bituminous coal, occasionally discovered in them. An outline of rock called the ""Squaw's Cap"" presents us with an abundance of fossil trees, and roots, with smooth and striated surfaces. Occasionally we find siliceous nodules in the blue sandstone, which are called ""bulls-eyes"". They injure the grindstones when they occur, and stones containing them are avoided. Grindstone Island is one mile long, and half a mile broad, and is estimated to contain about 140 acres of quarry stone. The average height of the island above highest tides is 60 feet. In obtaining slabs of the blue sandstone for making grindstones, the tides perform valuable services, for the quarryman has only to split out the rock at low water, and fasten it by chains to his flat boat and allow the rising tide to float it, so that he can transport the stone to high water mark, and leave it where he can work upon it at his leisure. The best grindstones are obtained from the strata which are submerged at every tide. The strata all dip down under the Bay of Fundy, at an angle of 38 degrees to the southward, and the trend of the strata is nearly east and west. The extensive quarries are supplied with heavy and massive cranes and a railway, for the removal of the stones to the wharf, where they are put on shipboard. On examining the ""posts"" of the quarry, we found that stones of from one foot to eight feet in thickness, and of any length and width, could be obtained, and that a supply of coloured stones could be procured in abundance. Most of the stones sent from Mary's Point are sold in New York, Philadelphia and Baltimore, no agency having yet been established in Boston. The exploring party next travelled around the head of Cumberland Bay, and reached the Cobequid Mountains, they found rocks of igneous origin, and colored slate, which lay under the grey sandstones of the coal formation. Mr. Dawson describes these slates as belonging to the Devonian order; contiguous to them are extensive deposits of ocherous oxide of iron, with different species of iron ore, and manganese carbonate of lime, known under the name of ""amberite"". Mr. Dawson has given as his opinion that the immense deposits of yellow oxide of iron have resulted from the decomposition of the carbonate of iron in the antherite. These are the Acadian Iron Mines of Londonderry, N.S. It is supposed that a subaqueous eruption has produced the pulverulent peroxide abounding in these mines. There are small veins, bunches and films of black oxide of manganese in these ores of 10 iron, and this renders them more particularly valuable in the production of steel, since it has been discovered that this ore contains 52 38-100 per cent of pure metallic iron, and if the manganese is all reduced and alloyed with the iron, it will amount to 1 53-100 of manganeseism, the proportion which will make the iron into the finest kind of steel. There is just one blast furnace now in operation at the Acadian mines, smelting these ores, and six Catelan forges are also employed. The iron produced is remarkable for toughness and strength - and is sold exclusively to steel makers in Sheffield, Eng. Since the immediate country around is hardwood forest land, an abundance of charcoal fuel can be obtained, and there will soon be other furnaces built near the mines. Having completed the survey of the numerous mines near the Acadian furnaces, the Doctor and his associates next proceeded to Windsor, thence to the Valley of the Annapolis to Nictaux, where they examined the inexhaustible beds of iron ore which are worked by Mr. Archibald, and have been named the Victoria Mines. Geological examinations of these ore beds were first made in the year 1827 by Mr. Francis Alger and Dr. Jackson. These beds are remarkable for having a great profusion of fossil shells, seeming to indicate that these ancient molluscs had a preference for an iron bed rather than one of clay. - The Report indicates that there are Orthocera and several others, as yet unknown or undescribed molluscs, in these ores, and it is difficult to determine their species. They all appear to belong to the Niagara and Clinton Groups of the New York system. One of the most curious phenomena presented at these mines is the magnetic state of some of the ores, while others not far removed are wholly devoid of magnetism. A great number of mines have been opened lately on these ores, and some new beds have been discovered since the original survey was made. There are two beds, which vary in thickness from 6 to 10 feet, and they have been traced 5 miles in length, and probably extend to Bear River. There are several distinct beds beneath the main ones - very compact and magnetic, others are softer and not magnetic ore. The last variety is seen in the red slates of Little River, and the others near Nictau River. It was found impossible to rely on the compass needle in surveying the magnetic ore beds, for the needle was static over them, and was attracted even when quite remote from the ore - the North point invariably pointing towards the iron ore. These mines may be considered to be inexhaustible, and the wood of the country around, though it may supply fuel for many years, is not adequate to smelt more than a small proportion of the ore in view. Hence it is advisable to export much of the ore to the United States, as well as to make charcoal iron for steel on the spot, for exportation to England. 11 This is being done under the new laws of reciprocity in trade with the British Colonies, which will allow of the exportation of Anthracite to Nova Scotia, free of duty; but the iron made in Nova Scotia cannot be brought to the United States without paying duties, and hence it will be sent to England. Anthracite will smelt the Nictau ores with great ease and iron made will be good but not so valuable as charcoal iron. The result of smelting of the ores proves that either white forge or grey foundry pig iron can be made equal in toughness to that from Russia and Sweden. It also makes fine cast steel, as has been proved by trials made of it in Sheffield, Eng. John L. Hayes, Esq., confirmed Dr. Jackson's statement with regard to Nova Scotia iron. He remarked also that iron, manufactured by means of charcoal, was the only iron used in the chain cables of the U.S. Navy. He thought the value of the charcoal iron over anthracite iron was

Eastport Sentenil - Dec. 27, 1876 Red Beach. - Business is yet good; the lumbermen are proposing to get out large quantities of cordwood and small lumber, which find a ready market at the depot of the Red Beach Plaster Co. The Bradwell Granite Co., have stopped work until spring on the Cook quarry. The Maine Red Granite Co. having a large quantity of granite quarried, have also suspended work on their quarry until warmer weather. The granite mill is running night and day, turning out work that cannot be excelled in this country. The Company took first prize at the Centennial Exhibition for samples of their work and granite."

Eastport Sentenil - Apr. 11, 1877 Red Beach. - The granite and plaster mills are still running of full time. Several cargoes of ground plaster have been shipped from here this spring. The first cargo of rock plaster for this season arrived yesterday in the Sch. Lizzie Newton, Capt. Hatfield."

Eastport Sentenil - Feb. 18, 1878 Red Beach. - The Red Granite Company have a saw in successful operation cutting the granite into slabs, doing the work of many men; they are also preparing to put in more heavy polishing machinery. The Stmr. Ella Knight touched here this week, taking in seven hundred bbls. plaster in one hour."

Eastport Sentenil - Aug. 10, 1879 Red Beach. - The Plaster Co.'s mills are in active operation manufacturing plaster. The Company are also putting in machinery, and proposing to manufacture phosphate of lime, intending to establish as good a reputation for that as they have for manufacturing plaster. The M.R. Granite Co. have been spiking a large quantity of granite lately."

Granite Co. have been spiking a large quantity of granite lately."

Eastport Sentenil - Feb. 4, 1880 Red Beach. - The Granite Co.'s works still run not withstanding the cold weather. Plaster Co., have been running their grinding works night and day so far, they have also just completed their works for marketing Phosphate under the supervision of Mr. William Pine of Eastport, an engineer who thoroughly understands the business. Mr. C.H. Newton, the Co.'s agent intends to manufacture an article equal, if not superior to the celebrated Bradley
Eastport Sentenil - Nov. 8, 1882 The Red Beach Plaster and Granite Companies have added largely to the water reservoir of the stream on which their mills are located. The waters of Pine Lake have been led into Noah's Lake by a canal, and new dams have been built on the last named lake. The new machinery for the Plaster Mills has been put in position, and the extensive repairs are about completed. - Times."

Eastport Sentenil - Jan. 17, 1883 Red Beach. - notwithstanding the heavy outlay for buildings, machinery and other improvements, the Plaster, Polishing and Phosphate mills are hung up for want of water. We had a thaw yesterday, it rained about ten minutes. ... The rocks are being fast put on to the site, for a red granite church. It will take about five

Eastport Sentenil - Mar. 7, 1883 The Maine Red Granite Co., and the Red Beach Plaster Co., are sorely in need of water to fill present orders. - Generally speaking, the water supply of these two important industries is second to none, but this winter's drought has diminished the fountain head, and a lack of power has been the consequence."

Codes: G3 / GYP / IDX_Names: Granite; Gypsum;
Eastport Sentenil - Jan. 30, 1884 Industrial Survey of Maine. - Washington County. - Red Beach and Robbinston. - Within the territorial limits of Calais, and about ten miles south of the city proper, is the village known as Red Beach, with a post office of the same name. A fine little deep water harbor extends in here, at the head of which is the outlet of an excellent water power stream which has been improved and utilized by two of the most enterprising and successful corporations in Maine. They are the Maine Red Granite Company and the Red Beach Plaster Company. The business of importing plaster rock from Nova Scotia and grinding it here has been carried on for the past fifty years, the works having been enlarged from time to time until they have reached their present magnitude. They now grind 10,000 tons of rock yearly, and have facilities for making from 350 to 400 barrels of calcined plaster and as much more of land plaster daily. They have large cooperage works where their barrels for packing are made, mostly by machinery. This product is sold by the cargo in the principal cities along the Atlantic seaboard, giving constant employment to quite a number of vessels. Four years ago this company commenced the manufacture of the Red Beach bone phosphate, and they have recently enlarged their facilities for supplying a demand of 2000 tons per year. They are constantly receiving very flattering testimonials from farmers who have fully tested the merits of their fertilizer, and their sales are rapidly increasing. In connection with their plaster mills they have a grist mill which grinds from eight to ten thousand bushels of corn yearly. The Granite Industry. - About a mile back from the plaster mills the outcropping of the red granite occurs, comprising twenty acres and occupying a hill where it can be easily quarried. The polishing and cutting works are located on the stream below. There is a strongly constructed building, 240 feet long by an average width of about 80 feet. An elevated travelling crane runs on a track through the building, which can deposit dressed or undressed granite blocks at any part of the works. The machinery is all run by water power and includes one of McDonald's stone-cutting machines, which is estimated to perform the work of twelve men. This machine has been recently put in here and is now doing good work. They have two column cutters, a large variety of polishing machines, lathes and every facility for doing a large amount of the very best work. They have recently purchased and are now working an Ingersoll steam drill at the quarry. They are now doing a large lot of polished work for the county buildings and post office now being erected at Lima, Ohio. Sixty men are employed at the quarry and in cutting and polishing departments, and this has been about the status of operations during the past three years. G.G. McGlashen, who had eighteen years' experience in Scotland before taking charge here, has designed the whole, and here is a fine school for those who are curious in mechanical operations. Mr. McGlashen has samples of polished Scotch granite, but they do not compare at all favorably with the warmth and beauty of color of the Red Beach article. That this kind of stone is the country rock here for miles distant, is shown by the coast-line ledges and beaches which have given the locality its name. On land owned by George C. Shattuck, about two miles west, is an inexhaustible supply of black granite, and fine pieces in polished work were there ready for shipment on the day of our visit. A striking contrast, which renders the beauty of each kind more prominent, is now among the leading ideas of builders, and we consider it fortunate for the company that an excellent quality of black granite is so near at hand with which to fill orders. Some of this granite is now sent up to St. Stephen by water, and there takes the cars for its destination; and a very important matter to be considered is the large amount of valuable granite on and near the line of the proposed Shore Line Railroad, which will afford an immense amount of freight westward. A new stone dam has recently been erected near the polishing mills, and the water supply is abundant in seasons of drought. In all departments of the business here over one hundred men are employed,

Eastport Sentenil - Nov. 12, 1884 The Courier says Samuel H. Nickerson of Calais, who is interested in the Red Beach Plaster Co. was in Cherryfield the first of the week. He left on Wednesday for points south and went on business connected with the company. Mr. Nickerson reports that the annual product of this company is nearly 40,000 barrels of plaster and 500 tons of phosphate. He also states that the Maine Red Beach Granite Co., which is practically one concern, are quarrying about 40,000 feet of granite, which is dressed and polished at their works and shipped to western markets. Both concerns employ about 150 men."

Eastport Sentinel - Oct. 15, 1890 The Red Beach plaster and granite companies make use of the New York steamer for shipment of goods. For the past two weeks a tug boat has towed the barge I.M. Todd loaded with barrels of plaster, and a scow with load of finished red granite to this place where the freight is put aboard the Winthrop."

Eastport Sentinel - Oct. 14, 1891Red Beach. - Owing to dry weather for the past month the plaster mill has not been running on full time; but dry weather does not interfere with the granite mills as when the water is low they use steam, and have been working about fifteen hours a day."

Codes: G3 / GYP / IDX_Names: Granite; Gypsum;

Eastport Sentinel - Dec. 14, 1892 The Maine Red Granite Co. at Red Beach, also the plaster mills at that place, continue to make large shipments of their respective products. The three masted schooner William Cobb, plaster loaded, from the above place and bound to a southern port, was in the harbor Monday, and the company's lighter, the Rocky Mountain, landed another lot of 360 barrels for transhipment by the International steamers, it being part of an order being forwarded to Australia. In addition to the plaster the lighter had a quantity of polished granite, intended for New York parties."

Eastport Sentinel - Jan. 25, 1893 Times: At Red Beach, quarrying has been suspended, and operations in the granite works have been reduced. The plaster mills are not running on full time owing to ice and a low supply of water."

St. Andrews Beacon - Mar. 21, 1912 Operations were resumed at the plant of the Red Beach Plaster Co. during the week, after a long period of idleness. The granite business at Red Beach is also good this year, and the outlook for the remainder of the year is brighter than it has been for some time. Calais Times."

Moncton Daily Times - Jun. 9, 1924 Early History of Albert County. - ... About 1800 commerce had so far opened up with other parts that the attention of the colonists was turned in the direction of shipbuilding. ... Among the first vessels built ... was ... the 'Brothers'. Thisvessel was employed chiefly in carrying plaster to Lubec,Maine, (the only seaport for this then) where it was sold and such commodities as the colonists needed brought back. She was retopped about thirty years after and employed in carrying plaster from the quarries on the south shore of Shepody Bay, now operated by the Albert Manufacturing Co., and known as Pink Rock. This vessel carried about 80 tons which was in those days considered a large cargo. ... Plaster was got out from the quarries nearer the river known as the 'Kings Quarries'. Two or three residents clubbed together, spent the winter breaking out plaster, which was hauled on the snow by teams to the bank of the river and shipped to Lubec in the spring. This would provide for them their summer supplies. A brisk business was carried on about eighty or ninety years ago getting plaster from the King quarries, which was run out on a wooden rail track and cars with flanged iron wheels. About the same time a brick yard and tannery was established on a rising ground at the head of Edgett's Creek and nearly surrounded by marshes. ..."

Codes: GYP / IDX_Names:Gypsum;
Fredericton Telegraph - Sep. 20, 1806 Strictures on the Necessity of Inviolably Maintaining the Navigation and Colonial System of Great Britain. - By Lord Sheffield. - ... the Americans have found means to establish open or secret connections, not only in Canada, but also in the Bay of Fundy, at the entrance of which they still retain possession of

Moose Island, where they have been permitted to erect a custom-house and to form other establishments, though the island evidently appears to belong, on every just principle of demarcation, to the British Settlement. From this place they supply his Majesty's subjects in the Bay of Fundy with their refuse commodities, such as adulterated brandies, inferior teas, East India muslins and cottons and sundry other articles; and having received in return the fish and other commodities, they hasten to the markets of the West India Islands, where they dispose of these cargoes to great advantage. In another island, called Campo-Bello, in the possession of British subjects, and in light of Moose Island, where we have a custom-house, they all contrive to carry on a considerable trade. The gypsum, or plaister of paris, landed in the island from Nova Scotia, and the Western extremities of New Brunswick, which amounted in the year 1794 but to 100 tons, amounted in the year 1804 to 16,000 tons; and the fish bought there annually for sale exceeds six thousand quintals. These articles, however, instead of being carried to the proper markets in British vessels, are wholly purchased, and carried two off, by the traders of the United States who bring in return almost whatever commodities they please, from Boston, Philadelphia, and New York. The export of the article gypsum, it is proper more particularly to add, has most rapidly increased, and is likely every year to increase in the same degree. Gypsum is made use of for manure in the United States; and the annual expenditure of it in the States, where the farmers, from the exhausted condition of their lands, can scarcely obtain any crops without it, amounts already, as is declared by very respectable authority, to upwards of 150,000 tons. The American States, therefore, must have resource to the quarries of Nova Scotia and New Brunswick, where this article is procured; but the Americans seem determined, not only to procure the article, but to secure the carriage of it, also, to their own vessels. Every artifice is employed for this purpose. A tonnage duty is imposed on the gypsum imported into the States in British vessels; and the encouragement of American custom-houses is not wanting to establish, as far as possible, the whole importation in American bottoms. The consequences have been decisive. The American vessels never want cargoes, for which they frequently pay in contraband commodities; and the injury resulting from this practice to British trade, has been stated in a memorial presented to Governor Carleton, in the year 1803, praying for the interference and protection of the British Parliament. ..."

Royal Gazette - Jul. 11, 1814 NOTICE. The unknown Person, who without leave, or any intimation given, landed a few weeks since, a Load of Plaister of Paris on the Wharf forming one side of J.L. Venner's Timber Pond, at Portland Point, is hereby notified, that if the said plaister is not without delay removed, it will be taken off at the charge of the owner; and that for want of a place to lay it, it may be necessary to throw it upon the Beach, as its weight is destroying the Wharf. 9th

City Gazette - Apr. 2, 1817 and Royal Gazette - Apr. 18, 1817 Plaister Law. An Act to Regulate the Trade in Plaster of Paris. Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, That from and after the fourth day of July next, no Plaister of Paris, the production of any country or its dependencies, from which the vessels of the United States are not permitted to bring the same article, shall be imported into the United States, in any foreign vessels. And all Plaister of Paris imported, or attempted to be imported into the United States contrary to the true intent and meaning of this act, and the vessels in which the same may be imported, or attempted to be imported, together with the cargo, tackle, apparel, and furniture, shall be forfeited to the United States; and such Plaister of Paris, vessel and cargo, shall be liable to be seized, prosecuted and condemned in like manner, and under the same regulations, restrictions and provisions, as have been heretofore established for the recovery, collection, and distribution, and re mission of forfeitures to the United States by the several revenue laws. Sec. 2. And be it further enacted, That this act shall continue and be in force five years from the thirty first day of January, one thousand eight hundred and thirteen[??]; Provided nevertheless, That if any foreign nation, or its dependencies, which have now in force regulations on the subject of the trade in Plaister of Paris, prohibiting the exportation thereof to certain ports of the United States, shall discontinue such regulations, the President of the United States is hereby authorized to declare that fact by proclamation, and the restrictions imposed by this act shall from the date of such proclamation, cease and be discontinued in relation to the nation, or its dependencies, discontinuing such regulations. H. Clay, Speaker of the House of Representatives. John Gaillard, President of the Senate, pro tempore. March 3rd, 1817. - Approved 5 James Madison."

Royal Gazette - Jul. 29, 1817 Boston, July 5. - Plaster of Paris. - The Act of Congress forbidding the importation in foreign vessels into the United States of Plaster of Paris, will take effect on the 5th July inst. And is to continue in force until the last day of January, 1822, unless the exportation of it from the British provinces in American vessels shall be permitted before that time. All plaster, the produce of New Brunswick or Nova Scotia, imported after that date in foreign vessels, will be forfeited, together with the vessel, her tackle and apparel. Orders have been sent to the several Collectors from the Treasury Department, requiring vigilance in enforcing the law, and defeating all attempts to evade it. --Plaster of Paris. - Notwithstanding the Legislature of St. John, New Brunswick, have prohibited, altogether, after the 1st of July, the exportation of Plaster of Paris from that Province, we are inclined to think from what we see published in the New Brunswick papers that there is no great probability of there being a scarcity of that article in our market. At present plaster is not allowed to be brought away in any vessels except British bottoms. In consequence of which, it is stated in the above mentioned papers, that the town of St. Andrews has become the centre of an American conspiracy, and bring the public authority into contempt: that instead of the inhabitants aiding the revenue officer of that port in detecting and preventing the smuggling of plaster, all assistance is wholly denied to him; that he dare not go in the night to prevent its being taken away; and even in the day time the smugglers set him and his authority at defiance. His boat has been taken away from him and made use of to carry the plaster off to wharves which the Americans are said to have erected on that Island.

From these facts it may be fairly inferred, that in despite of His Majesty's Collector, a tolerable supply of that article is likely to find its way to our ports."

City Gazette - Apr. 5, 1820 We learn that an Act has passed the three branches of the Legislature, which is to go into immediate effect - laying a duty of 7s5 per ton upon all Plaister of Paris, carried into, or shipped out of, the County of Charlotte - that is at the Passamaquoddy Lines, and that the Law contains such Provisions as afford the best reason to believe it cannot be evaded, and that it will be effectual in producing Revenue to the Province, at the expense of the United States, whose efforts are of late so perniciously aimed at the destruction of our Commerce. A Law in addition to the above has also passed, extending its effect to this Port, which we think unjustly deprives the Country of the benefit arising from the Free Port, so far as connected with a trade in this article - which is extensive, (and which will probably now be turned to Halifax) - and so long as the Americans will condescend to permit this trade, which it should be remembered they have not yet interdicted. But this supplementary Law does not depend on that contingency - it goes into immediate operation. We trust, however, it will be viewed in a true light, by our Nova Scotian brethren, and that they will perceive this Province does not hesitate in making a sacrifice of her present individual interest, to the hope of a future good, in which she will share in common with her Sister Colonies of Nova Scotia, and Cape Breton, - Let Nova Scotia once more open her eyes to this all important source of our Colonial Wealth - let her, in conjunction with us, and Cape Breton, send an Agent to England to explain the real state of things, as connected with the value of this important topic - and to pray for an Act of Parliament that shall secure the whole upon a just and permanent basis - or at least let her at the next session of her Legislature, meet New Brunswick upon the ground of laying a duty at the Quarries, upon all Plaister destined to the United States. - We are assured this is the wish of our Public Men - but this Province, acting alone, could only effect what she has now attempted."

N.B. St. John Star - Jun. 20, 1820 By a gentleman who arrived in the Ploughboy this morning from Passamaquoddy, we learn that a sloop of war anchored there on Sunday from Halifax, and had sent a boat with an officer on shore at Snug Cove; neither her name nor the occasion of her visit there were known, but it is the generally received opinion that she is intended to enforce the Plaster Laws, and to prevent the encroachment of the American fishermen. The P. was becalmed a few hours yesterday near the Wolves islands, during which time a row boat (supposed to be one belonging to the sloop of war) approached her, and fired two muskets, but a breeze springing up the P. proceeded on her passage without the boats' having boarded her; this circumstance strengthens the general opinion."

St. John Star - Jun. 20, 1820 Violating the Plaster Laws. - The schrs. Union, Coffil; Rover, Smith; and Elizabeth, Curry, all of Windsor, are detained by the Preventative Officer, for a violation of the Plaster Laws."

N.B. Courier - Mar., 1820 Plaster shipped..."

Codes: GYP / IDX_Names:Gypsum;
Royal Gazette - May 16, 1820 From the Halifax Free Press, of the 2d May. - Plaster of Paris Trade. - A few weeks since we noticed a law which has been recently passed in New Brunswick, regulating the Plaster Trade; and as we consider the measure of much importance to these colonies, and if rigidly enforced as one that will prove extremely beneficial, we stated that at a subsequent period, we should express our sentiment more fully upon the subject. The law to which we allude, may be justified and defended upon general principles, as well as the local advantages which it presents. A similar duty to that which it imposes, was proposed in Halifax during the last Session of the Legislature, but did not meet with the approbation of the members generally. It must be in the recollection of our readers, that a law was passed a few years since, which prohibited the landing of Plaster of Paris at any of the ports of the United States to the westward of Boston, thereby contemplating that it should be carried in our own vessels to the different ports in the Union. A similar act was passed in New Brunswick, and both subsequently received the sanction of the Prince Regent; and had the provisions of those laws been carried into effect, and had not the penalties been evaded, by the manner in which Gypsum was smuggled from St. Andrews, and the neglect to enforce the conditions of the Bonds in this Province, very great benefits would have

resulted to the colonies. The American Government subsequently passed a retaliatory act; and that circumstance combined with the reflection, that the Bill which had been enacted in Nova 7 Scotia, was almost invariably evaded, by the facilities afforded to smuggling in New Brunswick, induced the House of Assembly to repeal the laws in question. We were therefore much pleased when we found the Legislature of our sister Province, taking the lead in a measure which although it may be censured by the few who have profited by the possession of large quantities of this rock, and be viewed with apathy by others who have merely taken a partial view of the subject, must be considered by every person of enlarged minds and liberal sentiments, as calculated to operate to the advantage of these Provinces. Gypsum is an article in very great demand among the farmers of the United States, who use it for the purpose of manuring their land, and to increase the fertility of their soil; and they are chiefly indebted to those Provinces, for a supply of this valuable fossil. They naturally endeavor to obtain it upon the best terms in their power; and have taken care to secure to themselves the carrying trade, and compelled the people of this Province who have hitherto been engaged in the transportation of this article, to be mere hewers of wood and drawers of water, for the supply of their wants and.necessities. Not only has this been the case, but many persons who might have lived very comfortably upon the farms which they possessed, had they attended to the cultivation of them; were, by the prospect of immediate advantage and the supply of money which this traffic afforded, induced to engage in it; and were ultimately ruined by their indiscretion and folly. - They found it necessary in the first instance, to mortgage their farms to enable them to commence the undertaking, and while they supposed they were enriching themselves, were undermining their fortunes and involving their capital in inextricable difficulties. One instance we will beg leave to mention, which is not considered so injurious to persons engaged in this trade as others which might be enumerated:- A vessel which had been employed for two months, lost during that time, including the premium for assurance, no less a sum of œ140. Besides, the trade was in itself pernicious to the morals of the people, and injurious to the revenue of the Province. In return for the cargoes which were carried away, the persons engaged brought back East India Goods, West India Produce and British Manufactures, which they smuggled on shore; and in many instances were obliged to pay three shillings per yard for calico, which could be obtained in the Halifax market for one shilling and threepence. And in addition to the moral depravity which a repeated violation of the laws must introduce among a people, they sometimes came back a little affected by Yankee principles, and divested of that independent character which is the ornament of private 8 life and support of public confidence, and which contributes in a great degree to the prosperity and happiness of mankind. It is natural to suppose that much injury must have resulted to the Province, in consequence of the neglect of husbandry, occasioned by this desire for speculation, so prevalent, in the Western parts of it. As we have already stated, it induced people to dispose of their property for the purpose of embarking in a trade which, as it was carried on, impoverished their country, and by which they were ultimately ruined, and which was highly injurious to the morals of the people - it diverted their attention from agricultural pursuits, that might have rendered them happy and independent; - and while thus neglecting that which is of vital importance to the Province, they were enabling the inhabitants of another country, to raise with more facility that bread for their supply, which they ought to have raised themselves. In addition to all this, the article is in itself a very fit and proper one, on which to impose a duty for the increase of the Provincial revenue; and the smuggling of articles in return might have been prevented, by having different ports of deposit appointed in each Province, as is contemplated by the New Brunswick Bill, while the carrying trade would thus be confined in a great degree to persons who are already engaged in navigation. At all events the inducements, which have hitherto operated upon the minds of speculative men, and urged them to engage in an illegal trade, would no longer exist. Upon the propriety of taxing a raw material such as gypsum, we should presume there can be no difference of opinion among persons who are acquainted with the subject. ""The lowest and the most disadvantageous species of commerce which can be carried on,"" says a celebrated author, ""is the exportation of raw materials in return for wrought goods; as when wool is sent abroad to purchase velvets; hides or poultry to procure shoes, hats or linen cloth. This trade is unfavorable to population, because, it leaves no room or demand for employment, either in what it takes out of the country, or in what it brings into it. Its operation on both sides is noxious. By its exports, it diminishes the very subject upon which the industry of the inhabitants ought to be exercised; by its imports, it lessens the encouragement of that industry, in the same proportion that it supplies the consumption of the country with the produce of foreign labor."" And he further observes, ""that agriculture is the immediate source of human provision; that trade conduces to the production of provision only as it promotes agriculture; that the whole system of commerce, vast and various as it is, hath no other public importance than its subserviency to this end."" Now it will not we presume be disputed that the procuring of Plaster of Paris, can employ but a small proportion of the inhabitants of a country - that is, merely those who are employed to obtain it from the bowels of the earth; and we think it will also be admitted that the employment of transporting it, in the manner in which it has been done, has not been productive of public benefit - while it has created much private injury; - no industry is required to prepare for it a foreign market, which would be so much gained; and therefore it becomes a proper article upon which to levy a duty; particularly when we reflect that the Americans can procure it from no other quarter upon so advantageous terms as they would, after paying such duty, obtain it from this Province. These are our sentiments and we would be glad to hear the opinions and arguments of those who differ from us, conveyed in a temperate and gentleman like manner. We have extended this article beyond our usual limits, but trust the importance of the subject will be deemed a sufficient excuse. We perceive that some persons in New Brunswick are averse to the measure; and the Editor of one of the Halifax papers has so far embarked in the cause, as to insert a communication from a St. John's paper, which breathes defiance to a law of the land, and abounds with the most unequivocal and impudent threats. We are satisfied that the Legislature of that Province, duly weighed the consequence of the measure before they adopted it, and that the Executive will appoint a person to enforce the law, who will not be deterred from a faithful discharge of his duty, by virulent abuse and unmanly invective. And in conclusion we would observe to persons who merely skim over the surface of things, that ""the principles of commerce are extremely complicated, and require long experience and deep reflection to be Royal Gazette - May 21, 1820 Saint John, May 27. - The Preventative Officer, with the schooner Shannon, of Shubenaccady, brought in for a breach of the Plaister Law, arrived here on Wednesday. We are ashamed to say that Mr. Humbert had not anchored his vessel half an hour in Snug Cove on his first arrival, before a shot from a musket was fired from the above schooner, which fell close alongside, and that Peter McArthur, Master of the Shannon, made his boast of the firing, at the office of the Deputy Collector before him and several other persons. An attempt was made to rescue the Shannon, by a number of armed Persons from Moose Island, which, from precautionary measures taken by the Preventative Officer, proved unsuccessful. - Another 10 attempt to surprise the Shannon was made by arming a number of men and waylaying the schooner at the Head Harbor, which was avoided by taking the L'etite Passage. There appears the most desperate determination among the Plaster Traders to risk their vessels and evade the Plaster Duty, and that they are encouraged in so doing by Persons in Office under the British Government, who ought to know and practise Royal Gazette - May 21, 1820 From the St. John Star. - Mr. John Humbert, who had been missing since Monday week, returned on Sunday last via Digby. The following statement will account for his sudden disappearance and detention:- On Saturday sennight, the schooner Mary, Capt. Joseph Dill, was seized at the entrance of this harbor by Mr. J. Humbert, Deputy Preventative Officer, for a violation of the Plaster Laws. On Sunday afternoon Mr. H. went on board accompanied by one man as ship keeper; and about one o'clock on Monday morning Mr. H. hearing a battle upon deck, immediately called to his man then on deck, to learn what was the matter, who said he could not give an answer to any of his questions, as they (the master and crew) threatened him with violence. They then secured Mr. H. in the cabin, hove up the anchor, slipped the other cable, and proceeded to sea; keeping Mr. H. confined until about two o'clock p.m. on Monday, and on Tuesday morning at 7 set him ashore, in a thick fog, about 12 miles below Annapolis Gut."

City Gazette - May 17, 1827 Plaster of Paris. - For some time past, we have understood it to be a generally received opinion, that Plaster of Paris, as a manure, is not adapted to the soil of this Province. But having lately been in conversation on this subject, with an intelligent Gentleman of King's County, he assured us that this was not the case, that Plaster had repeatedly been found to answer well, and that the principal hindrance to a free use of it, was in want of proper mills to grind and prepare it for the ground. This brought to our recollection, an experiment which we had seen made in the county of York, upwards of twenty years ago. Garret Clopper, Esq. in his garden in Fredericton, had planted Indian Corn and other articles, 2 in alternating rows, with plaster and the best barn manure, and at the time when we saw them, the difference in the colour and strength of the blades of corn, and also of the other articles, was greatly in favor of that on which the plaster had been used. How the crops turned out we never heard. We, however, think that the subject is of importance, and if sufficient number of experiments have not already been made, satisfactorily to settle the question, it may be worthy of attention of intelligent practical Farmers, and especially of Agricultural Societies."

Eastport Sentenil - Jun. 26, 1872 Red Beach. - Business is lively here, the Red Beach Plaster Company is the motive power that runs our little village. The manufacturing is under the management of Mr. C.H. Newton, one of the proprietors, whose energetic business talent makes the place teem with busy life. It is interesting to see the movements of the ponderous machinery that converts the huge blocks of gypsum into good calcined plaster, all of it is done under the supervision of Mr. Aleck Mingo, the wide awake and efficient overseer."

Eastport Sentenil - May 8, 1872 Moose Island - Sixty Years Since.. - ... By Lorenzo Sabine. - ... Besides the flour that was shipped to Eastport, several cargoes were landed in creeks and by-places along the shore, between West Quoddy and the entrance to Machias River, as affording the best opportunities for communicating with British subjects on the Island of Grand Manan. ... To that territory, the owners and agents of these large quantities of flour, determined their property should be transferred, by fraud or by force; and there were desperate men among them. The officers of the government - of whom there were soon a host - were arrayed in arms to defeat their purpose. - Sentinels in the pay of the Collector of Customs, were stationed within twenty or thirty rods of one another, upon the head-lands, and other look-out places. The compensation to most was small ... troops ... four gunboats were stationed in our waters. ... At first the price of smuggling was but twelve and a half cents, but as the risk increased, the price advanced, and finally, rose to three dollars the barrel. ... one man earned for his own labor and the use of a small boat, the sum of forty, or even fifty dollars in twenty-four hours... The smugglers worked hard under cover of the night, and of the fogs, and said they knew why fogs were made; they skulked about the rocks and hid themselves in the indentations of the shores. .... the men who were appointed to watch their movements became ... their allies..."

Eastport Sentenil - May 22, 1872 Moose Island - Sixty Years Since.. - ...... By Lorenzo Sabine. - .... At the opening of business in the Spring, many of the inducements to the prosecution of contraband trade, which existed in 1808, had ceased; while in August, the ports of St. John and Halifax, were closed by proclamation against free admission of American produce. - The principal trade which remained was in gypsum or plaster of Paris. The restrictive policy of both governments - fast hurrying to war - compelled the American people on the frontier, as well as those in the Colonies, to resort to various expedients in order to earn subsistence. The traffic in gypsum, was of consequence to both, and the article was extensively used in the agriculture of the South. That a commodity deemed essential to increase, and to cheapen, the production of southern staples, was entirely interdicted, may appear strange to those who are familiar with the politics of the times. But such was the case, and there was no lawful means of introducing plaster of Paris into the United States. Still, as, - in the words of the old adage - ""Necessity is the mother on invention,"" a way, carrying upon the face of things, the forms of law, was speedily devised. It was this - a merchant here, would produce a cargo of plaster, bring it into American waters, and, perhaps, land it. He would then go to the Collector of the Customs, and lodge information against it - against his own property, be it remembered. In due time, it would be condemned, and sold. At the sale, opposing bidders - where all were alternately alike situated and did the same thing, - were of course, few, and the owner purchased it much at his own price, besides receiving on settlement with the Collector, his share of the proceeds, as the informer. Thus, then, he had obtained a quantity of plaster, which, having been forfeited to the government by his own set, could be transported under the protection of the law, to any port in the country. A few tons - just enough as the phrase was, ""to swear by"" - were put on board of an American vessel, and cleared at the Custom-house. As the Deputy Collector was ""very accommodating"" - such is the story - the clearance specified no definite quantity, the balance of a cargo could be taken in on the British side, without exciting suspicion, when that document should be examined at the port of destination. To Head Harbor, or some other place across ""the line"", the vessel was accordingly sent, to complete her lading. Another practice was, to clear at the Custom-house a definite number of tons and about one tenth what the vessel would carry, and then, by adding two letters to the quantity cleared, make a full and legal cargo. Thus, if six tons were specified in the clearance, the addition of ty made six, sixty, so seven, became seventy, and nine, ninety. By these and similar methods, the trade was safely continued until the restrictions were removed."

Eastport Sentenil - Apr. 16, 1873 Red Beach. - Sch. Montezuma, Bulgar, with plaster cleared same day."

Eastport Sentenil - Feb. 28, 1873 10 Red Beach. -Two cargoes of plaster cleared from here this week, per schooner Helen G. King, Crosby, and Sunbeam, Bunker. Schooner Swallow, Carlow, has hauled on to load."

Eastport Sentenil - Jul. 16, 1873...Upon arrival at the village, we were cordially received by Mr. Samuel Lawrence, general overseer of the Red Beach Plaster Company's Mills, in which C.H. Newton, Esq., of Calais is now, and has been for some nineteen years, largely interested. It is an extensive establishment, the building connected therewith covering more than one acre of territory. A Leffel wheel propelled by twenty six ft. fall of water supplies power equal to a 120 horse power steam engine, and is sufficient to operate all the machinery employed in converting rough hard plaster rock into the finest quality of calcined plaster for building purposes. Some 10,000 tons of the rock is imported yearly from Nova Scotia, and manufactured for shipment to all the principal cities and towns in the United States. Owing to the increasing demand for this commodity, the company have been obliged from time to time to increase their facilities for manufacturing, until now they are able to turn out from sixty to seventy thousand barrels per year. Their works are supplied with every convenience for discharging vessels laden with plaster rock, and also for loading casks and barrels of the land plaster and refined calcine. The old horse ""Go and Back"" tackle and fall arrangements for hoisting is substituted by a wonderfully constructed, cast iron, rotary cylinder, operated by water power, and ingeniously arranged so as to be stopped at a moment's notice. The hoisting line by which the tub or hod of rock plaster is raised to the vessel's deck, passes around the cylinder and the whole movement is regulated by one man who has charge of the brake. Some five chartered vessels beside four belonging to the company, are constantly employed in importing the rock plaster, carrying from 150 to 200 tons each, also as many more vessels are engaged in shipping the calcined and land plaster. They have on the same stream connected with the mills, improved styles of machinery for sawing out staves, ..?... also, a single saw mill for long lumber which cuts from four to five hundred thousand feet of logs yearly. The lumber is principally used about the mills and vicinity. There are two or more copper shops in connection with the manufactory where 300 casks are made daily when all branches of business are in full operation. About 200 men find constant employment in the various departments of this establishment. The pay roll amounts to nearly $10,000 per month. Some eight years ago, water from Meguerrawock lake was let into their mill stream to afford more power, but to accomplish this very desirable object, it was necessary to cut a channel through solid ledge, averaging some eight feet in depth, and last year the increase of business demanded still greater power, so that the channel had to be lowered still four feet. The whole expense attending this great enterprise including dam and flowage of lake, amounted to about $20,000. They now have sufficient power to operate all their machinery to profitable advantage, and have manufactured for shipment some 5000 barrels of refined calcined plaster within the past nine months. Connected by long shafting from the main wheel, is a grist mill where 100,000 bushels of corn are ground out annually. There is also a blacksmith shop for manufacturing and repairing such tools and machinery as are needed about the mills. The entire works are provided with apparatus for extinguishing fire by means of a force pump or engine supplied with 300 feet of hose by which water may be thrown upon any roof connected with the establishment. ..."

Eastport Sentenil - Sep. 24, 1873 Red Beach. -... the Red Beach Plaster Company still shows signs of great vital energy, after having piled upon their wharves about 10,000 tons of plaster. They are also building a new wharf with 100 feet front and making some extensive repairs. We do not have any lockout or strike here. - Among the several vessels employed by the company to bring the rock plaster, we notice the new schooner J.A. Hatfield, J. Hatfield, master. She was built expressly for the plaster trade and is a model of strength and beauty; the ceiling is six inches thick from the sister keelson to light water, and all edge bolted, she registers 130 tons and carries 240 tons of plaster; we think our Dominion neighbours not far behind their go ahead yankee friends in building vessels."

Eastport Sentinel - Aug. 5, 1874 Notwithstanding the dull times the Red Beach Plastering Co. are filling up their wharves with rock plaster, and making ready for a busy season. Mr. Joseph Rockwood is at work building them a very large building for storing ground plaster."

Eastport Sentinel - Jul. 15, 1874 Red Beach. - Mr. Newton is importing considerable plaster rock from Nova Scotia, and has a number of vessels loading with calcined plaster for Washington City, D.C. - This, like all other branches of trade, is dull, but so long as there is any demand for the commodity produced, it affords employment for men and vessels, and keeps business alive, which is far better than suspending entirely."

Eastport Sentinel - Mar. 18, 1874 Red Beach. - ... The plaster manufactory has started this spring, running every department to its fullest capacity; loading vessel after vessel, with a dispatch highly gratifying in their respective captains, also showing that their excellent plaster has a good demand."

Eastport Sentinel - May 6, 1874 The proposed Plaster Mill at the Salt Works is very likely to prove a failure. About $10,000 of capital stock was subscribed here Monday, but as that is only half the amount needed the enterprise will be likely to fall through, unless Mr. Tompkins can bring more capital into the business. We heartily wish that enough stock could be taken up to insure the enterprise as there is but little doubt that a plaster manufactory could be made to pay well at this place, and there is no doubt but that the place would be greatly benefitted by one."

Codes: GYP / IDX_Names:Gypsum;
Daily Telegraph - Dec. 18, 1877 Plaster Export. - The Hillsboro works, last week, shipped 430 barrels of plaster to Portland,

Eastport Sentenil - Apr. 10, 1878 The Red Beach Plaster Company are unusually active this spring, having a large demand for their excellent plaster; recently they have been shipping plaster as fast as vessels could be chartered."

Bay Pilot - Aug. 28, 1879 The plaster Co.'s mills, at Red Beach, Me. ..."

Eastport Sentenil - Feb. 26, 1879 Red Beach. - Business is fair here. The Plaster Manufactory has been running night and day nearly all winter. The company are shipping plaster as fast as vessels can be chartered. Sch. Almeda, Capt. Lione, and Sch. Bertha J. Fellows, Clark, both of Pembroke, have been loaded and sailed last week. Sch. James S. Pike, Lunt, is now loaded ready to sail for Fall River. The superintendence of the Plaster Manufactory has changed hands. It is at present under the supervision of Mr. C.H. Newton, the right man in the right place, for he believes in having things move

S.J. Globe - Oct. 10, 1879 The Plaster Business. - The plaster business has fallen off very much this season. The customs department of the United States seem determined to shut the calcined article out of their markets entirely and to accomplish this they have increased the valuation of it, thereby increasing the duty to such an extent as to render its export there a losing speculation. Next year's plaster business threatens to be very dull. The sales in the Upper Provinces are not very satisfactory owing to the high cost of transportation by the I.C.R. This will prove a heavy blow to Hillsboro'. This is but poor encouragement to such enterprising gentlemen as Messrs. Tompkins, who have unstintedly invested their means in developing the plaster industry. They will continue shipping rock plaster.- Sackville Post"

Daily Telegraph - Sep. 17, 1880 Shipment of Plaster. - The Sackville Transcript mentions that plaster, from the quarry which is managed by Mr. James Kerr, was shipped from Grand Aunce to the United States last week. Another cargo is shortly to be shipped."

Eastport Sentinel - Feb. 28, 1881 It is reported that the Red Beach Plaster Co. never did a larger and more profitable business than at present. Their orders are already two months ahead of their work. - Union."

Moncton Daily Times - Jul. 23, 1881 Gray's Island, Hillsboro, as a Shipping Port. - Editor Daily Times, Sir:- The certificate hereto annexed speaks for itself. Almost from time immemorable Gray's Island has been a shipping point of more or less importance, but since the completion of the Albert Railway, with a branch to the Island, and the large wharf extension, it has become a very important shipping point. The proprietor, Mr. Johnston Steeves, though he has been adding new wharves and extending old ones, finds that with the steadily increasing requirements his wharf accommodation is still too limited, and occasionally disappointment has been caused to shippers on this account. This, however, will be remedied ere long by still further additions. Yours, Citizen. I, James Copp, Master of the barquentine Elinor Vernon, 576 tons register, recently loaded at Gray's Island wharf, (so called) at the port of Hillsboro, N.B., do hereby certify that said wharf is a good and safe place for vessels of large tonnage to load, and the tidal currents are specially favorable for the reception and mooring of vessels of any tonnage. J.A. Copp Hillsboro, July 19th, 1881."

Moncton Daily Times - Apr. 14, 1883 The Plaster mills of the Albert Manufacturing Co. are now in full operation and a busy season is looked forward to with interest. Were it not for these mills dullness would prevail here. An immense quantity of plaster has been gotten out during the winter months and is now awaiting shipment, which will take place soon as navigation

Chignecto Post - Apr. 19, 1883 The Albert Manufacturing Co. have for some time been hauling plaster from the quarry. About eight teams are now engaged. No shipments have yet been made. The Magellan, Capt. C. Wood, is, however, now at the wharf. The rock plaster is to be shipped to Newark, the ground to different ports. A large summer's work is expected

S.J. Daily Sun - Mar. 27, 1883 Albert Co. history. - early salt making from sea.... at Gray's Island.... About 1813, a trading vessel arrived.... The sameyear, Mr. Steeves built a vessel to trade with St. John. She was about 70 tons burden, and afterwards used to carry plaster to Lubec. A man named Wiggins opened the first plaster quarry."

Eastport Sentenil - Jul. 29, 1885 Red Beach. - The Red Beach Plaster Co., in order to meet the increasing demands for their plaster and bone phosphate, will put up some extensive sheds this season, also repair and improve their machinery."

S.J. Daily Sun - Apr. 3, 1886 ADVERTISEMENT: 1 Carload of Land Plaster, Landing. For sale low by J. Willard Smith, No.6 Ward Street"

Codes: GYP / IDX_Names:Gypsum;
Moncton Daily Times - Jul. 29, 1886 and S.J. Globe - Jul. 30, 1886 A Big Transaction. - The Little Lake plaster quarry, so called, at Hillsboro, Albert County, was sold yesterday under decree of the equity court. Mr. J.T. Tompkins was the purchaser, the price being $21,000."

Moncton Daily Times - Mar. 31, 1886 Hopewell Cape. - Schooner Hattie C., Captain Stewart, arrived, discharged ballast and will proceed to Hillsboro to load plaster for New York."

Daily Times - Dec. 21, 1887 A Big Trade in Plaster. - The Albert Manufacturing Company, of Hillsboro, Albert county, have landed at Moncton by scows and schooners this season 18,000 bbls. of their products, and 15,000 barrels of this quantity have been reshipped over the I.C.R. to points in the upper provinces. So much for inter- provincial trade. This with sugar and coal shipments must make up a large volume of business for the I.C.R., Moncton ranking with ST. John and Halifax in point of revenue from freight traffic. The schr. Hattie C., Capt. Stewart, has just cleared at Hillsboro for Newark, N.J., with 2600 bbls. calcine. The company has shipped by water to Halifax this season, two cargoes in addition to the large shipments as above noted and to U.S. ports. There has been a great increase in the production of the works in the past

S.J. Daily Sun - Dec. 10, 1888 The cargo of plaster of the American schooner H.C. Higginson, wrecked off Atlantic Hill, Mass., on Monday, while on a voyage from Hillsboro, Albert Co., to Newburg, was insured for $3,100."

Weekly Record, Page 2 - Friday, May 11, 1888 MARITIME MISCELLANY - The plaster trade between Hillsboro and the United States seems to be working up to fair proportions."

Moncton Daily Times - Nov. 2, 1889 Albert County. - Mr. James Blight of this place, who has been in Cape Breton the past summer operating a plaster quarry, is expected home in a few days. He will take back with him a number of men to help him in the quarry."

S.J. Evening Gazette - Sep. 28, 1889 The Waterside. - The schooner Waterside was launched at Waterside, Albert Co., on Thursday. She is 356 tons carpenter's measurements and 171 registered tonnage, and is owned by Senator McClellan; Troop & McLaughlin, of St. John; Alex. Black, of Dorchester; Capt. A.H. Kennie; W.S. Starrat, the builder, and Capt. H.S. Chambers who commands her. The Waterside will load plaster at Hillsboro for New York."

Eastport Sentinel - Dec. 2, 1891 Red Beach. - The Red Beach Plaster Co. is setting a new boiler for calcining plaster; it will enable them to calcine one hundred and eighty barrels an hour."
1813 - Copied from: S.J. Daily Sun - Nov. 2, 1891 Albert County history... About 1813... The same year Mr. Steeves built a vessel of about 70 tons to trade with St. John. She afterwards carried plaster to Lubec. A man named Wiggins opened the first plaster quarry."

Moncton Daily Times - Sep. 7, 1891 Ran Ashore. - Sch. Drisko, Capt. Drisko, Hillsboro for New York, with plaster, ran ashore on L'Hommedien Shoal, Vineyard Sound, night of 2nd. She floated again on the 3rd apparently uninjured and

Daily Sun - Apr. 11, 1892 Hillsboro, April 8. - Benjamin Fales, while working in the plaster quarries, had one of his ankles badly crushed by a rock falling upon it. Dr. Randall rendered the required surgical aid."

S.J. Daily Sun - Dec. 23, 1892 Hillsboro.- When the S. and H. train came in yesterday, the switch was open in order to side track a number of car loads of plaster pushed ahead of the engine. Form a defect in the signal the engine driver came with speed sufficient to carry the train into the main line, consequently he could not slow up in time to avoid colliding with some flat and box cars on the siding; fortunately not much damage was done."

Moncton Daily Times - Jan. 12, 1892 Business in Albert Co. - A correspondent at Hopewell Hill, A.C.. writes: The weather has been remarkably mild and open, but snow is now needed for hauling purposes. The plaster quarry company have a large quantity of plaster out and are anxiously waiting the arrival of snow, when it is to be hauled to the public wharf for shipment by the spring. Navigating has not yet closed this winter, the bay being as clear as in the summer season. The buoys, however, were taken up some time ago, in anticipation of ice in the bay, and the fog alarm on the island shut down on January 19th for a period of two months."

Codes: GYP / IDX_Names:Gypsum;
Carleton Sentinel - Jun. 18, 1892 Genuine Tobique Plaster is for sale by R.K. Jonesat the Woodstock Plaster Works. This plaster is imported in the rock direct from the Tobique and ground by the plaster works. Great care is taken to have it ground right."

Daily Sun - Nov. 17, 1892 Edward Maloney of Newfoundland met with a severe accident yesterday while working in the plaster quarry at Hillsboro. A lump of plaster became loosened and fell striking the man's head and shoulder, making a bad cut and otherwise injuring his body. Dr. Lewis, who attended to the injuries, thinks they will not prove fatal."

S.J. Daily Sun - Sep. 29, 1892 Hopewell Hill, Sept. 27. - There is prospect, it is said, of a large plaster quarry being opened and operated extensively at Curryville. Hopewell Hill will probably be the out-port for the mineral."

Moncton Daily Times - Aug. 7, 1893 Albert Co. - The schooner Flora E., of Parrsboro, N.S., came to the public wharf at the Hill yesterday to load plaster, but has been unable to take in cargo on account of the wharf being piled up with deals."

Daily Sun - Feb. 18, 1893 While at work blasting in the gypsum quarries on Monday afternoon Daniel Robertson had the misfortune to get badly cut about the head by a rock. Dr. Marven rendered the surgical aid, having to take several stitches in the wound."

S.J. Daily Sun - Jan. 6, 1893 Hopewell Hill. - Chas. Shaw, who is working the plaster quarry at Chemical Road, has got out a considerable quantity of plaster, and has a large face cleared off for further operations. He expects to get out a thousand tons this winter, and will put on a number of teams as soon as there comes snow for hauling."

N.B. Reporter - Oct. 25, 1893 A Rush For Mining Applications. - The mining fever is very largely prevalent throughout the province if one is to judge from the number of searching and prospecting licenses being received at the Crown Land office. Yesterday over three hundred areas were applied for. Among the applications lately received are some for licenses to search and prospect for asbestos in theMagaguadavic district in this county. The greatest run of applications has been from Westmorland County, where the applicants are all after gold. From Albert County there has been a number of applications for licenses to searchand prospect for plaster. - Gleaner."

Moncton Daily Times - Sep. 14, 1893 Albert Co. - Sept. 10. - Schooner H.R. Emmerson, with barrelled plaster, from Hillsboro for St. John, sailed today.."

S. J. Gazette - Dec. 1, 1894 Killed at Plaster Rock. - A man named Hutchinson, belonging to Victoria County, was killed at Plaster Rock, yesterday. The particulars of the fatality have not yet come to hand, but as near as can be learned Hutchinson was either blasting at the time, or working at the bottom of the hill, when a large rock rolled down upon him. The young man's father is also a resident of Victoria, and is well known as an influential politician. - Fredericton Gleaner."

Carleton Sentinel - Jun. 2, 1894 Woodstock Industries. - Plaster Mill. - As an annex to the W.W. establishment proper Mr. Jones runs a mill for grinding fertilizing plaster. There is a crusher and one run of stone. This mill is capable of crushing and grinding 10 runs per day; this spring they have been running 5 tons per day, the product being ground specially fine. And there is a constant demand for the plaster as it is ground. There is an elevator and apparatus connected by which the ground plaster is conveyed to the store room on second floor and thence by a spout to the scales. It is sold in bulk or in bags or barrels as desired."

S.J. Daily Sun - May 17, 1894 Map of Moncton harbor showing plaster wharf ...."
Albert Star, Page 3, Wednesday, October 3, 1894 SHIPPING Port of Hillsborough Cleared September 25 - Schooner Mattie J. Allis, Crocket, Newark, plaster. September 26 - D. J. Sawyer, Look, New Haven, plaster. September 27 - Schooner Elwood Burton, Day, Philadelphia, plaster. September 29 - Schooner G. E. Bentley, Hatfield, New York, plaster. October 1 - Schooner Harry L. Whiton, Crosby, Alexandria,plaster."
Albert Star, Page 3 - Wednesday, September 12, 1894 LOCALS - Clarence H. Dimock, of the Wentworth Gypsum Company, Windsor, NS, and J. B. King of the firm J. B. King & Company, manufacturers of plaster, New York, visited the new plaster quarries owned by Mr. Dimock at Demoiselle Creek, last week. The plaster from these quarries has been tested and proved a superior quality. A new wharf has been built at Gray's Island, Hillsboro's, affording ample shipping facilities. It is rumoured that Mr. Dimock will built a plaster mill at the quarries next summer. This new industry, with the rock plaster to be shipped, will add much to the commercial interests of our town. A branch line from the Salisbury & Harvey railway is now being built to thequarries."

Codes: GYP / IDX_Names:Gypsum;
Carleton Sentenil - Apr. 6, 1895 Arthurette. - Apr.1.- On Thursday a load of plaster was taken down."

Daily Sun - Dec. 9, 1895 Moncton. - Instantly Killed at Plaster Quarry. - (Special to the Sun), - Moncton, Dec. 8 - A man named Alex McDonald was instantly killed at the plaster quarry at Hillsboro on Friday. He was in the act of liberating some partially loosened rock plaster on the side of a steep bank when the rock beneath him gave away without warning and he went down with the mass. His skull was crushed and death was almost instantaneous. Deceased was 28 years of age and the support of a widowed mother and younger children."

Moncton Daily Times - Dec. 13, 1895 Albert Co. - Hillsboro. - The funeral of Dandy McDonald, who was killed on Friday at the quarries was largely attended. The Joseph Luther, Capt. Francis, is loading plaster for Hoboken, New Jersey. A number of vessels are to load before the plaster mill closes operations for the winter."

Moncton Daily Times - Jul. 3, 1895 Hillsboro. - Railway men are at work in Curryville, on the branch road to the plaster works at that place. It is intended to work the plaster quarry more extensively. The familiar figure of Captain Parker is again seen on our streets. His vessel is loading with plaster at Gray's Island."

Moncton Daily Times - Jul. 11, 1895 The Tobique Valley. - Hon. Mr. Costigan's Examination Continued. - (Special despatch to the Daily Times). - Ottawa, July 10. - Examination of Hon. Mr. Costigan with respect to the charges made against him by the St. John Telegraph in connection with the Tobique Valley railway was continued before the public accounts committee this morning. Mr. Costigan repeated his statement of yesterday that when the Dominion subsidies were granted to the Tobique Valley Railway Company and rearranged he had no property whatever along the line. However, in 1890 a gypsum property on the line was offered him for $2,500 and was accepted. This property was about 100 acres in extent. Except for one or two other private properties in the vicinity all the rest of the gypsum land was held under lease from the provincial government by a local company in which he (Mr. Costigan) was not interested. Cross examined by Lister, Mr. Costigan said he bought the property on May 12th, 1890, and on May 13th the government asked parliament to vote a second subsidy of $35,000 to the Tobique Valley Railway. Lister said that Hansard showed that when this subsidy was asked for, Mr. Mulock asked who had the gypsum fields, and Mr. Costigan replied that they were held chiefly by the provincial government and one or two private parties. Today Mr. Costigan said that the statement was correct. Mr. Costigan asserted that he had no object in seeking subsidies for the railway company other than to discharge his duty to his constituency. He admitted there was no doubt that the construction of the railway increased the value of the Gypsum mines. He transferred his property in 1892 to the Tobique Valley Gypsum Mining and Mfg. Co., getting as a consideration paid up stock in the company. The cross examination was continued by Mr. Lister with a view of showing that Mr. Costigan knew that the supplementary subsidy for the road was to be brought down to the house and that this subsidy would go far to completing the chief portion of the line while the original owner of the gypsum field bought out by Mr. Costigan had become weary of waiting for the completion of the road and so sold his property at a sacrifice price."

Daily Times - Jul. 16, 1895 Hopewell Hill, July 12. - The schr. Harry W. Lewis arrived at the Plaster wharf, Hillsboro yesterday, took in a cargo of 650 tons of rock plaster, and sailed today for Newport. This is quick dispatch. The three-masted topsail schooner Bahama is loading plaster at Hillsboro, and ten other schooners are now due at that port. An enormous amount of plaster in rock and barrels is being shipped from Hillsboro this season."

S.J. Gazette - Jul. 25, 1895 Ship Gypsum Prince, before reported ashore on the Old Proprietor, has been sold to Mr. Ford of Westport for $25. After the cargo of gypsum is discharged the vessel may possibly be floated."

Moncton Daily Times - Jun. 25, 1895 Rockport, June 22. - The schr. J. Haley loaded at Dernier & Seaman's quarry on the 20th inst. and sailed for Yarmouth. Also Jennie Palmer at same place took in 60 tons today for St. John and sailed for Wood Point, where she loads balance of cargo."

S.J. Daily Sun - Mar. 25, 1895 Albert Co. - Hopewell Hill, March 22. - .... The plaster and deal trade this season promises to be of very large proportions."

Codes: GYP / IDX_Names: Gypsum;

Moncton Daily Times - Mar. 30, 1895 Albert County. - Plaster Found on the Farm of Capt. Albert Stiles, Hopewell Cape; ...... - Hopewell, March 28. - ..... Capt. Albert Stiles, of this place, recently found plaster in large quantities on his farm. It lies at distances varying from five to fifteen feet below the surface. The plaster is thought to be of a superior quality, and specimens have been sent to Boston to be tested. The locality is a convenient one for shipping plaster, being only a short distance from either the railway or Shepody Bay. Capt. Stiles has sunk an eight foot shaft to some depth."

S.J. Daily Sun - May 1, 1895 Hopewell Cape, April 29. - Sch. J.D. Sawyer, Capt. Look, sailed yesterday with barrelled plaster from Hillsboro for Philadelphia."

S.J. Daily Sun - May 1, 1895 Hopewell Cape, April 27. - William H. and Herbert Peck are home for a few days. They have been away all winter at sea in the fine vessel J.D. Sawyer, in which the former holds the position of first officer, and will join her as soon as she has finished loading plaster at Hillsboro. Herbert will assist his father, Captain Allan Peck, this summer in piloting, watering and boating for the large ships loading here and at Grindstone Island."

Moncton Daily Times - Oct. 2, 1895 Albert Co. - Schr. Victory, Stiles, passed down the bay on Saturday from Moncton, with a cargo of tanbark for Malden, Mass. While his vessel was in port, Capt. Stiles visited his home at this place, to take a look at his plaster quarry, work in which is being prosecuted by Mr. James Robertson of Albert Mines, the well known

Daily Times - Dec. 17, 1896 Plaster Schooner Wrecked. - Bound from Hillsboro, Wrecked on Nantucket Beach. - The Second Mate Washed Overboard, Rest of the Crew Saved. - (Special despatch to The Daily Times) - Nantucket Beach, Mass., Dec 16. - The schooner Ulrica, Captain James Patterson, Hillsboro, N.B., with plaster came ashore on Nantucket Beach this morning during a heavy gale. The second mate was washed overboard and drowned. The remainder of the crew were rescued by the life saving station crew. The vessel is a total loss. She was 298 tons register, owned by C.F. White,

S.J. Daily Sun - Oct. 18, 1897 A four masted schooner, supposed to be the Gypsum Princess, bound from Windsor to New York with plaster, put in here yesterday morning for shelter. She is anchored just inside the island."

Daily Sun - Apr. 4, 1898 Hillsboro. - Two schooners came up the river on Saturday, the first of the season. They will load plaster at the Albert Manufacturing Co.'s wharf."

N.B. Reporter - Apr. 13, 1898 The works at Plaster Rock, on the Tobique, are to be re-opened under the management of Jas. Stewart of Perth, who will grind Tobique plaster for shipment to all parts of Canada and to Maine where it is in demand for the large potato fields. Notice is given of the incorporation of the Tobique gypsum company (Limited) to carry on operations in Victoria county, N.B. With the exception of the Hon. John Costigan, the members of the company are all Ontario men. Capital stock $40,000."

Daily Sun - Mar. 29, 1898 Hopewell Hill, March 25. - The schr. Utility has left her winter quarters, and will load plaster at Hillsboro. She is in charge of Capt. Copp, jr., a son of the former master. A quantity of plaster and earth weighing several tons, fell from the face in the Hillsboro quarry a day ot two ago. Albert Steeves of Demoiselle Creek had a leg broken

Daily Sun - Dec. 15, 1899 Thomas Reid, a native of Newfoundland, was struck by a plaster car at the Hillsboro quarries yesterday, and had the toes and part of one foot jammed off. James Nickerson was also injured at the quarry the same afternoon, by being run into by a car."

Daily Sun - Nov. 29, 1899 Hopewell. - Work at the Chemical Road plaster quarry, which has been closed for some years, is to be resumed. Chas. D. Shaw having secured a contract to get out 1,200 tons."

N.B. Reporter - Sep. 13, 1899 The Tobique Manufacturing company have about fifty men at work at Plaster Rock. A dam is being built across the Tobique River and a large shingle mill will be built this season, and other machinery will be added. Messrs. Hale and Murchie are the principal promoters of the enterprise and F.H, Hale, M.P., is managing director for the company. The company is a strong one, the facilities for operation good, and the natural resources in lumber and gypsum are practically unlimited."

Codes: GYP / IDX_Names:Gypsum;
Woodstock Dispatch - Sep. 13, 1899 ADVERTISEMENT: Notice. 100 more good rock men and other laborers wanted by the subscriber at Tobique Narrows, Victoria County, N.B. John W. McManus Perth Centre, N.B., Sep 2nd, 1899"

Woodstock Dispatch - May 16, 1900 Up the Tobique River. - ... One of the prime objects in the building of the railway was the development and shipment of gypsum from the place now known as Plaster Rock, the terminus of the road. Gypsum of the finest grade exists at this point in inexhaustible quantities, its red and white cliffs stretching in great height for over a mile along the river banks. A large plaster mill with improved machinery and good capacity has been erected, but its shipments have so far not been as great as anticipated. Just at this point the waters of the Tobique are now held in restraint by a big dam erected last year by the Tobique Manufacturing Company. They have in view the manufacture of

Daily Sun - Sep. 6, 1900 Albert. - The steamer Bratsberg, loaded with plaster for New York, is in an unpleasant position at the plaster wharf. She is wedged in the mud and sunk so far that all efforts to sail have been unsuccessful. It is hoped that the tides may be high enough by the last of the week to admit of her getting safely off. Meanwhile she was a hundred tons less than her regular load and is seriously interfering with work at the wharf."

Daily Sun - Sep. 18, 1900 Curryville, Albert Co., Sept. 14 - Detective Peck and Constable Spencer made a flying visit here today. Their business was the arrest of a gentleman hailing from Arabia, who for some weeks has been working at the Dimmock plaster quarry and boarded at the Klondyke Hotel. The information was laid before Willard O. Wright by Frank Richards, a native of Bonaventure Co., Quebec, who was a fellow laborer and boarder with Joseph Rood, the accused. The charge is theft of five dollars and a pocket book. The accused was taken before the magistrate tonight and remanded until ten o'clock in the morning. Joseph H. Dickson, Q.C., clerk of the peace, will appear to prosecute."

S.J. Daily Sun - Dec. 31, 1901 Hopewell Hill, Dec. 29. - The steamer Bratsberg passed down the bay yesterday with plaster from Hillsboro. This is probably the steamer's last trip this way for the season."
St. John Star - Nov. 20, 1901 Messrs. King of New York are developing a plaster quarry at Hillsboro."

S.J. Daily Sun - Nov. 30, 1901 Hopewell Hill. - The new three master Ophir passed down the bay last night for New York with plaster from Hillsboro."

Daily Sun - Jan. 6, 1902 Hopewell Hill, Jan. 3. - Two large barges in tow of the tug Gypsum King, are anchored off Grindstone Island tonight, bound down the bay with plaster from Hillsboro."

Daily Sun - Jan. 30, 1902 Hopewell Hill, Jan. 28. - The new King plaster company which began operations last fall at Hillsboro, report excellent prospects for the future, and are prosecuting the work energetically this winter. A thirty- foot face was recently opened up, of the finest white plaster. The company shipped one cargo last fall, and will be able to do a good business the coming season."

Daily Sun - Jul. 28, 1902 Hopewell Hill, July 25. - The three masted schooner Ethyl B. Sumner sailed tonight for New York with plaster from Hillsboro."
Weekly Record - Fri., Feb. 20, 1903 It is reported that some Boston capitalists have purchased a valuable gypsum deposit at some point in Albert Co. and will develop same vigorously at an early day. The exact place and details are not yet
Weekly Record - Fri., Jul. 10, 1903 W.A. Bannington, of Boston, of the New England Adamant Co., and Frank Milton, of Moncton, have been at Hopewell Hill looking after the new plaster quarry at Woodworth Settlement, near there."
Kings County Record - Feb. 24, 1905 Upham. - .... Owing to the great depth of frost in the ground and snow on top. the plaster miners have had to suspend work until warmer weather. Captain Newcombe and son leave for their homes in Nova Scotia today."

St. Andrews Beacon - Feb. 8, 1906 The strike among the plaster workers at Red Beach, Me., is still on. The men want an increase of wages."

Semi-Weekly Sun - Jan. 24, 1906 Hopewell Hill. - Benjamin Fales of this place went to New Horton this week to open up a new plaster quarry for Frank Milton of Moncton, who has a lease of the property. The new quarry is on the farms of Warren Copp and Stillman Wilbur."

Semi-Weekly Sun - Jun. 27, 1906 Albert Co. Quarries in Full Operation. - Hopewell Hill, June 25. - Chas. King, of Boston, who holds a leading interest in the New England Adamant Co.'s plaster quarries here, was in the village this week inspecting the properties. The company have now the Stiles' quarry in full operation, and are hauling two car loads of plaster a day over the S. and H. railway to point of shipment at the Shepody River."

Granite Town Greetings - Mar. 25, 1908 The Red Beach Plaster Mills which were closed down for two months have started running."

Granite Town Greetings - May 26, 1909 The rumor is about Red Beach that a syndicate is thinking of purchasing the plaster mills. The old book keeper Mr. Oliver Jameson has been recalled to go over the books. It is said that they have 30 days to decide whether it is a safe investment and buy."

Moncton Daily Times - Apr. 22, 1910 Plaster Quarry May be Opened Near Petitcodiac. - Petitcodiac, April 20. - A meeting of citizens was held here one evening last week to consider the plans of a company coming here to open up a plaster quarry, within two or three miles of this town. The rock is of a first- class quality, and there is an immense quantity of it, and a splendid opportunity for operation. It is expected it will be opened up soon."

Eastport Sentenil - Jan. 19, 1910 Four coal and plaster barges owned by the firm of J.B. King & Co., of New York, are harboring for the winter in the safe waters of Quoddy river, having been recently towed here by steam tug Gypsum King from Hillsboro, N.B."

Eastport Sentenil - Mar. 9, 1910 Steam tug Gypsum King of the J.B. King Company of New York came into harbor on Monday last leaving Wednesday with the three barges of the above company in tow which have been harbored in Quoddy during the past two months."

Weekly Record - Apr. 21, 1911 Land plaster for sale. - Farmers in the vicinity of Sussex can purchase land plaster at Jeffries Mill, Sussex Corner, at the rate of $5 per ton cash. Bring packages to put plaster in, as it is ground fine like flour. As storage is limited, plaster must be handled quickly. W.H. Holmes."

Weekly Record - May 12, 1911 Land plaster for sale. - Farmers in the vicinity of Sussex can purchase land plaster at Jeffries Mill, Sussex Corner, at the rate of $5 per ton cash. The following is the analysis of this plaster; Lime 32.86%; Magnesia, trifling, Ferric Oxide and Alumina, .24%; Sulphuric Anhydrite, 46%; Carbonic 77%; Water, loss on ignition, 19.68 per cent; Insoluble mineral matter, 34 per cent. Bring packages to put plaster in, as it is ground fine like flour. As storage is limited, plaster must be handled quickly. W.H. Holman."

Weekly Record - May 12, 1911 Land plaster for sale. - Farmers in the vicinity of Sussex can purchase land plaster at Jeffries Mill, Sussex Corner, at the rate of $5 per ton, cash. Bring packages to put plaster in, as it is ground fine like flour. As storage space is limited, plaster must be handled quickly. W.H. Holman."

Albert County Journal, Page 4 - Wednesday, August 23, 1916 - Albert mines. - August 11 - Mr. James Blight, ofHillsboro, has been loading a barge from the plaster quarry here."

Kings County Record - May 12, 1916 The Gypsum mine at Upham is again being worked,and gives promise of being a good paying proposition. Mr. Thomas Woodworth, of Hillsboro, is in charge."

Telegraph Journal - Oct. 24, 1929 Lobbying Probe Reviews Action on Gypsum Duties. - Representative of Manufacturers Had Access to Closed Sessions. - By Ken Clark, Canadian Press Staff Correspondent. - Washington, D.C., Oct. 23. - The duty on gypsum, a product exported from eastern Canada to the United States, came in for mention during today's session of the Senate Committee investigating lobbying activities in Washington. The committee asked Charles L. Eyanson, of the Connecticut Manufacturer's Association, what the Senate Finance Committee had done about the duty on gypsum. Eyanson said he did not recall. In reply to another question he said the Connecticut Plaster Company was a member of the Connecticut Manufacturer's Association. Eyanson has been on the stand several times for questioning in connection with his employment by Senator Bingham, of Connecticut, a Republican member of the Senate Finance Committee. Bingham hired Eyanson as his secretary and as such Eyanson had access to the closed sessions of the Finance Committee. The Senate Finance Committee in its revision of the House Tariff Bill did not alter the tariff on

Progress - Feb. 9, 1895 Notes of Provincial Industries. - ...The aiding of coal mining and coke making. New Brunswick has in its surface seams a billion tons of workable coal, much of which can be brought to the proposed docks by pipe line at a total cost of not exceeding $1 a ton, or by rail at $1.25 a ton. This coke can displace most of the anthracite now used in the maritime provinces, and much of that imported into the St. Lawrence valley. Therich oil shales of Kings and Albert counties, of great extent, can, by aid of the proposed company, be utilized, as is done in Scotland and elsewhere. The proposed company can insure the smelting of iron ores in this city, and out of this industry a dozen kindred ones would soon grow up; numerous ore deposits, some of them of the purest known, are available; some experts assert that St. John is the most favorable location, all things considered, in Canada, for large iron industries. And Mr. Peter Imrie, of Liverpool and the White Star line, says: Canada, from the abundance of her nickel deposits, must necessarily control the ship-building trade. Iron pyrites can be delivered in this city in any required quantities, at rates that will ensure its utilization here, and also large shipments abroad. The proposed company can readily establish this and some other industries with but little capital, in anticipation of the construction of the docks. From mussel rock, gypsum and limestone, to be hadnearly in exhaustless quantities, and also sulphuric acid"

1806 - Copied from: S.J. Daily Sun - Sep. 20, 1879 Martin Head… Here in 1806 resided the Messrs. Hazen, and the ruins of the cellar of their house are yet visible. Not far from the point where their house stood is a plaster quarry which they worked successfully by means of a tramway from the place of excavation to that of loading."

N.B. Courier - Apr. 27, 1816 and City Gazette - Jul. 10, 1816 ADVERTISEMENT: Valuable Landed Estate & Plaster Quarry, to be disposed of. To be Sold or Leased, The whole or part, as may be agreed upon, of that veryvaluable Tract of Land, at and near Martin's Head, on the northern side of the Bay of Fundy, within 50 miles of this City by water, and within a less distance by land, through a good road by the way of the French Village, containing upwards of 2400 Acres of Marsh and Upland of the best quality. There are not less than 50 acres of Marsh, of which 23 acres are dyked; and near 50 acres of the Upland are cleared and under cultivation. There are on the premises a comfortable dwelling house, barn and out houses, and wharf and store, and am inexhaustible Quarry of Plaster of Paris, or Gypsum, of a superior quality to any that has yet been discovered either in Nova Scotia or this province, which may be easily quarried and conveniently drawn to the wharf for shipping - upwards of 8000 tons were shipped at this wharf during the last season. The situation is peculiarly convenient for Ship-building, and the land abounds with Timber of all kinds fit for that purpose, with a stream contiguous thereto upon which any number of Mills might be easily erected. There is a safe harbour and a good Herring fishery. The Cod Fishery, might also be carried on here under the greatest advantages. The place is at present furnished with Teams of Horses and Oxen, Carts and implements of every description for carrying on a Farm, or the Plaster Trade, which will also, if required, be disposed of, and nearly 2000 Tons of plaster are new on the wharf for sale. The situation and value of this place are too well known to require a further description. - The terms of payment will be made easy to any person inclined to purchase, which together with further particulars, may be known by applying at the Office of Ward Chipman, Jun., Esq., in this City. St. John, 20th April, 1816."

Evening Times & Star - Jun. 3, 1910 Investigate Coal Lands Near Sussex. - Sussex Record:- The existence of coal not 1,000 miles from Sussex will be investigated at an early day and should it prove worthy of development same will be forthcoming promptly. Kings county seems to be most prolific in surface indications of valuable mineral deposits.A recent investigation of a body of graphite andanother mineral in the vicinity of Southfield which are now being tested, may lead in the near future, if the tests made prove satisfactory to the development of the said areas. The gypsum deposits on the farm of William Holman at Upper Corner are being practically tested, if satisfactory, the development of same may be

Codes: GYP / G3 / IDX_Names:Gypsum; Granite;
Eastport Sentenil - Dec. 15, 1875 A new Industry For Maine. - The Manufacture of Polished Granite in Calais. - Messrs. F.A. Pike and C.H.Newton, the proprietors of the extensive and successful Plaster and Calcining works at Red Beach in Calais, in the dull times which have depreciated the prices of their products, have turned their attention to a new industry. The success which has attended the manufacture of ground and calcined plaster under their management is largely due to the business capacity and inventive ingenuity of Mr. Newton, who has devised so many labor-saving machines for diminishing hand labour in the various processes of the manufacture, packing and loading of plaster, and in making casks, and has so methodically systemized and arranged the different departments of the work, that they have now an establishment where the cost of a product always marketable, has been brought to the minimum, and with which there can be no part of the United States a successful competition. Their main mill stands upon a stream, which they have expended over twenty thousand dollars in reinforcing by canals from other streams and from ponds, to give it an inexhaustible head of water, just where it falls into St. Andrews Bay. - the road between Eastport and Calais along the west bank of the St. Croix passing between their mills on the one side, and their store, storehouses and wharves upon the other. The vessels that bring the crude plaster almost thrust their bowsprits into the mills as their cargoes are discharged by machinery propelled by their main driving wheel. The same power is ingeniously applied to drawing the heavy rock to the upper story of the grinding works, where almost without hand labour it is crushed in a heavy squeezer, into lumps smaller than an egg,

and dropped into iron cylinders where it is broken into fragments small as Indian corn to descend by its own weight into hoppers carrying it under rotatory stones that grind it to the fineness of flour. A large part falls into casks, shaken down and packed by machinery, for shipment for fertilization, and the choicest kinds go into the calcining kettles, to be dry-boiled, prepared, packed in air-tight barrels, and shipped to be used in building and in the arts. The general stagnation has affected the plaster business and the works have been running during the last season with few hands and on short time. Messrs. Pike and Newton are not men to succumb to hard times, but set to work to find something that would sell when the plaster buyers were backward. The red rock that crops out everywhere near the coast and whose debris gives the sand of the shore for miles the warm and picturesque color that has furnished the neighborhood with its name, is found to be red granite of a very fine texture, beautifully and uniformly mottled, and easily quarried and cut. The proprietors have prepared and polished specimens of this rock and sent them to New York, Boston and elsewhere for exhibition. Specimens will also be prepared and sent to the Centennial Exhibition at Philadelphia next summer. In the company's store at Red Beach polished shafts are exhibited along with specimens of Scotch granite, and of the red granite of St. George in the province of New Brunswick. In texture, richness of coloring, and lustre of polish, the Red Beach specimens are evidently superior to the products of both the foreign quarries. The rock is in inexhaustible supply, and by adding a little to their lands by purchase, Messrs. Pike and Newton have secured the whole of a hill running from the sea shore to the lakes a mile inland, which seems to be all of red granite to an unknown depth. It lies in sheets, easily quarried and cutting about as easily as the Hallowell granite. It is but a few rods down the hill from the quarry to the mill, where, after being hand hammered it is to be polished by machinery. The dam, bridge, and mill are already built, the latter only waiting for its machinery. After being hammered the stone is subjected to rubbers and is ground first with sand and water, and then with emery until the surface becomes vitrified and lustrous, with a polish that no exposure to the weather has yet been able to tarnish or discolor. The pillars and shafts are subjected to a rotary motion against the rubbers, but to polish flat surfaces, the stones are firmly bedded and the rubbers play back and forth over them. It takes about four days to complete the grinding and polishing of any surface. From the polishing mill to the wharf whence the stone can be shipped to Boston, New York, and other large cities, is less than a quarter of a mile. There is said to be an ample demand for the manufactured product in all parts of the country. The Scotch granite is shipped in large quantities and is sold at great prices. It is at present, very much in request for burial and other monuments. It is used in the exterior and interior structures of the most costly churches, banks and other public buildings, and is everywhere greatly admired and sought for, for its beauty and durability. If it can be produced in this country. at little more than the cost of labor, mainly automatic, expended upon it, it will come into use for many other purposes; for mantles, furniture, shop and bank counters, and many other articles now manufactured of marble. We understand that about $30,000 have been expended as a capital to start this new business, and that too at very great advantage. The lumber put into the mills, dams, and bridges, much of it cost but $5 per thousand, and the labor was done at the very lowest rates. There is every reason to believe that the enterprise will prove a profitable one to its projectors. One great advantage which the business has, as relates to the general prosperity, is the amount of labor it will employ. Although the polishing can be done by machinery there has been yet, no successful contrivance for saving slow hard labor in hammering stone, though even that may not be beyond the genius of Mr. Newton. It will take a large force of men to prepare the stones, to keep all the polishing works which are to be provided, in full operation, and coming in a time when the lumber business together with ship building and other manufacturing is almost suspended, this enterprise may be considered a providential relief to hundreds of people on the point of turning their backs forever, upon the homes of their childhood, in despair of being able to earn there, their livelihood. - Portland Advertiser."

Eastport Sentenil - Nov. 17, 1875 Red Beach. - Business is just snapping here now. The Plaster Manufactory is running on full time, and the Granite Co. are pushing their operations vigorously ahead. The large dam is nearly completed, Mr. S.G. Lowe the overseer being an adept at such heavy jobs, is making as strong a wooden dam as there is on the river. Mr. Rockwood's crew are well along with the Polishing Mill which is an immense wooden building constructed of extra heavy timber. A large crew is also at work on the Granite quarry, in fact no well man need be idle here now."

Eastport Sentenil - Oct. 6, 1875 The Red Beach Plaster Co. are putting up apolishing mill for finishing up the red granite found in that vicinity. Red Beach is quite a thriving place at present."

Eastport Sentenil - Oct. 6, 1875 Red Beach. - Business is looking up, here, just now, a large force is at work laying the foundation for a dam and a large Polishing Mill to work the red granite found in this vicinity. The work is being pushed ahead by the Red Beach Plaster Co. under the supervision of Mr. G.G. McGlashan an able engineer who formerly conducted the Granite Works at St. George, N.B. The Company are already filling some small orders. The granite finishes up nicely."

Eastport Sentenil - Oct. 6, 1875 The Red Beach Plaster Co. are putting up apolishing mill for finishing up the red granite

found in that vicinity. Red Beach is quite a thriving place at present."

Apr. 1882 - Copied from: St. Croix Courier - Apr. 4, 1912 30 Years Ago:Business at Red Beach has been brisk this winter. The Maine Red Granite Company are filling orders as rapidly as possible, and are putting in new and expensive machinery, the bone phosphate works are running full blast; the plaster manufactory has been driven all winter to its fullest capacity, and vessels are being chartered and loaded with despatch. - Mining Journal."

Eastport Sentenil - Jul. 11 1883 Red Beach. - Business has been brisk here this season. The different manufactories have been pushed allthe spring to fill the orders. ... The granite and plaster mills have been running night and day. The Granite Co. is about to put in place some expensive and heavy machinery to cut stone, also a steam drill on the quarry. ... The granite is on the site for the new Congregational church. The society will probably have it built this year."

Eastport Sentenil - Apr. 23, 1884 Red Beach. - Rain! Rain! It has been raining for the last three days interfering somewhat with the work on the granite quarry, but the Company improve every fine hour in driving the work ahead. Schr. Lucy Wentworth, Capt. Hannah, is loadinghere with plaster for Baltimore."

Eastport Sentenil - Feb. 6, 1884 Red Beach. - On account of bad weather, the Granite Co. has stopped work at the quarry for a short time. The Plaster Mills are running night and day, in fact, the company are running all of their machinery to its fullest capacity in order to be able to fill the large orders for plaster and also their Bone Phosphate."

Codes: GYP / G3 / IDX_Names:Gypsum; Granite;
Eastport Sentenil - Feb. 25, 1885 Red Beach. - Although the winter has been bad, business here has still been moving along, the Plaster Company running night and day to meet the demands of the market for their plaster and bone phosphate. ... The Granite Co. is still doing something, but will probably increase their crew in the spring."

Eastport Sentenil - Nov. 11, 1885 Red Beach. - The Plaster Co. has just finished some extensive repairs on their plaster mill, and are now running night and day. They are now putting more heavy machinery in place in the Phosphate mill. Mr. G.G. McGlashen, superintendent of the Granite Works is confined to his house with lung trouble."

Eastport Sentenil - Apr. 21, 1886 Red Beach. - ...... The Plaster Co. has shipped this spring, fifteen thousand barrels and three thousand bags of plaster, also two hundred tons of phosphate. Their works are running night and day, to fill the large orders that still keep coming in. The Plaster Co. has added to their different industries, that of making marble dust for the manufacture of soda water. They have also got a large order for ground bone to fill this spring. The Red Granite Co. is hard at work on a fifteen thousand dollar job, for the Capitol grounds in Washington, D.C."

Eastport Sentinel - Sep. 16, 1891 The Red Beach Plaster Co. is doubling its capacity for making calcined plaster.The Maine Red Granite Co. have all the orders they can attend to; the Shattock Granite Co. is building a new cutting shed, polishing mill and engine house."

Codes: GYP / G3 / IDX_Names:Gypsum; Granite;
St. Croix Courier - Nov. 7, 1929 First Records of Red Beach District Date Back 300 Years. - Picture Shows Thriving Settlement As It Appeared Forty Years Ago When Plaster and Granite Mills Were In Operation. - Drawing Loaned and Sketch Prepared by B. Y.Curran of Calais. - Older readers of the Courier at home and abroad will find much to recall memories of former days in the following sketch of the early history of Red Beach prepared for this paper by Ben Y. Curran, of Calais, recognised as an authority on the history of this district: Red Beach in 1889. - by B.Y. Curran. The rusty rocks that cup the cove of Beaver Stream rim around a little island off the shore - the storied Isle St. Croix. The records of this region go back to times when the courtiers of Henry of Navarre floated the flag of France in the first settlement of Acadie to its destruction by the gentleman adventurers of Virginia under the pirate captain Argal. And to the later coming of the barons of New Scotland or Nova Scotia supplanted by the New England colonists and then the Stars and Stripes. The first record and perhaps the last of France is in the grant to Razilly, Grand Commander and Lord Lieutenant in Acadie, a cousin to Richelieu, of the territory of St. Croix from mouth to source and the adjacent country in a hundred mile strip. This in 1632. After the defeat of the New France project and the occupancy by the English, no reference comes to us until the Boundary Commission proceedings from 1794 to 1798. Following the adjudication of the commission. Ward Chipman, the British Agent, reported to the Governor of Nova Scotia that in the year 1799 certain inhabitants of the American shore nearby had occupied the island. From this time some settlement of the island and Red Beach is to be dated. Mingo Family From Nova Scotia. - In the early eighteen hundreds, a Swiss family named Mingo had emigrated to Nova Scotia and from there Michael Mingo came to Red Beach. During these early years tradition asserts a residence of the family on the Island. Descendants now live at Red Beach where their interests in the industries identified with this section retained them. Lumbering First Industry. - Undoubtedly the first of such employment for the original settlers was lumbering and to this the little stream had lent its aid long before the first attempt at a plaster mill. This came in 1837 when the Legislature of Maine created by Special Act the Calais Plaster Mill Company. This was succeeded in 1856

by the Red Beach Plaster Company, which was in 1865 authorized to utilize the Eastern Lake source of Beaver Stream making possible greater power for the plaster mill purposes and the increase of the business. Down to the year nineteen and ten the plant was successfully operated. After that more or less difficulties in the trade made business uncertain and several close-downs and resumptions of operations resulted. Plant Burned Three Years Ago. - On the thirtieth day of August, 1926, the plant was closed and it chanced that a steam roller was parked with banked fires close to the buildings at the pond. A high wind was blowing from the machine toward the buildings and in a few hours the structures all about were utterly destroyed by fire. What you will see today is a clean sweep of road and the wreck of rock and wharf foundations - the monuments to an industry once sustaining a thriving community around the little cove at Red Beach. PICTURE. - Lithograph of Plaster and Granite Mills from 1889. Key to Picture. - The group of buildings in the centre of this reproduction comprises the plaster mill, the calcining plant (with smokestack), and the stave mill and shed. The buildings on the wharves in front are (left) the stock and rock plaster shed, the store house, and the cooper shop, and (right) general store, plaster shed, and hoop shed. Just below the upper mill pond, on the road leading up from the right-hand wharf, is the granite polishing works, on the distant hillside above the pond, marked with the letter M. the quarry. On the upper side of the main street, to the left of the plaster mill, is shown the Union Congregational Church and on the lower side of the street just where the next road down the hill intersects is Red Beach House. Following up that road the first building on the left side is the public school (note the children playing outside) and next to the school the Red Beach Hall, which is still standing. Other landmarks here will be easily recognized by present day residents and others acquainted with this locality. The vessels at the wharves and the small steamer in the river give some idea of the water borne traffic that was at one time a feature of this whole district and a source of employment for a large number of residents. While the general appearance of Red Beach has changed since 1889 many of the old buildings shown here are still standing. Altho it has lost its industries in

The Busy East, Page 22 - April - May, 1925 The Hillsborough Plaster Company - (Material provided by Mr. James S. Blight) - The pioneer of the business was Captain James Blight, a Cornish miner. In Cornwall he took contracts in tin mines. The word Captain is a Cornish term for contractor. He was married in Cornwall to Catherine Seymour. He came out to Boston about 1850 and within a few years was sent by Fowler & Company to Hillsborough. In Hillsborough, Mr. Blight operated quarries for Fowler. While doing this he became interested in prospecting for Albertite coal. He found anoutcropping of Albertite in Lower Hillsboro and took up property on the prolongation of Albert Mines vein and prospected it with a diamond drill. For ten years or more he prospected and during that time formed several companies in Boston and New York to develop Albertite. He also located the Dominion Coal Mines in Pictou county, Nova Scotia and one in Cumberland County. The latter operated only periodically. In Hillsboro Albertite proved not to be in paying quantities and the companies which he had formed disbanded about 1880. Two or three years before his death Mr. Blight turned again to developing plaster quarries and sold the gypsum to Weatherspoon Brothers, New York. He shipped about 5,000 tons a year as low as 70¢ per ton. This was on land which he was already operating for coal. James Sr., died about 1880, leaving a family consisting of a son, James and a daughter Mary. James Jr. was born in 1856. He continued to develop the quarries operating them about

seven years. The Albert Manufacturing Company purchased the land in 1890. Mr. Blight Jr. then travelled over Nova Scotia and Newfoundland looking for plaster in the interests of the J. B. King, Company, New York. He located quarries at windsor, Nova Scotia, which at present have an output of 300,000 tons a year. He developed and operated a quarry at Demoiselle Creek of white paster about 1890. This quarry has an output of 10,000 tons a year of the very best quality of plaster. A heavy overburden of clay from 40 to 60 feet deep is found over the vein of plaster which vein is 90 feet thick and covers an area of perhaps 50 acres, which is scarcely more than prospected as yet. It is mined by the room and pillar method, The greatest length of the tunnel is 1,000 feet, At the level where it is entered it is 30 feet from the top of the vein. The level has been operated for twenty years and now employs about twenty men. The plaster from this quarry has been used largely in the pottery trade in Ohio, U.S.A. It is operated by the King Company. The plaster is shipped by C.N.R. and loaded into ships at Gray's Island. The Hillsborough Plaster Quarry was taken over from N. C. and C. N. King Brothers who had been operating it for some years. It was run by the Hillsborough Plaster Company which was a company subsidiary to J. B. King Company (J. B. King was a nephew of N. C. and C. N. King). The plaster found in Hillsborough quarry makes strong walls but is not white. When James Blight was operating it, the output was from 15,000 to 20,000 tones a year. It employed about twenty-five men and worked only in the summer. During the first summer the plaster was hauled by terms to the Government Pier at Edgett's Landings, while the Company's wharf was being built. Next year the Company built an incline railway, the only one in the Maritime Provinces used in the gypsum trade. It was used for five years but was too slow and expensive. Now since 1920 the rock is crushed at the brow of the hill and transported over a conveyor to the storage bin in the ravine and loaded on cars. There is a tunnel under the bin and here it is drawn off into cars. The cars are hauled to the Company's wharf by a small engine. The 'sidedump' cars are used where the Albert Manufacturing Company uses 'end-dump' cars. The plaster is not touched by hand. It is blasted from the face, loaded by steam-shovels into the cars, dumped over a screen to clear the dirt away and thence into a crusher. The capacity of the crusher is 500 tons a day. In 1923 about 250 tons a day were turned out. In 1924 the J. B. King Company amalgamated with the United States Gypsum Company who will enlarge operations. The proposal is to increase the output from 40,000 tons to 100,000 tons per season. Improved machinery will remove the necessity of employing more help. Compressed air boring drills are used in place of hand augers. James S. Blight took charge in 1920, as manager. He has introduced the crusher and air drills. George and Barry Blight are superintends at the plants. James S. took an engineering course at Mount

N.B. Reporter - Dec. 16, 1864 A friend in Hillsboro writes us as follows. Concerning the plaster and plaster trade of that locality:- ""The whole Parish of Hillsborough, I am told, has a population of 3,000, but the town has not more than 1200, I think. There are 10 or 12 shops, which retail a little of every thing, a Telegraph and Post Office, the Store of the Plaster Company and also a grinding mill of the same company. There are two tracks, which cross the main street, the one conveying plaster from the quarries to the Mill, the distance being about three miles, the other, the Albert Coal track, which runs from the mines to the river Petitcodiac, on which Hillsboro is situated, being a distance of between 5 and 6 miles. The Plaster Mills, as the overseer informs me, can grind up to 100 tons of plaster per day, though they do not grind more than sixty tons on average. The Company send most of their plaster to the States, but as at present the South is shut up they have lost a great market. The Quarries themselves are situated about two miles to the west of Hillsboro, in a region of rounded hills, where there is an inexhaustless supply of the plaster, of which there are four varieties. The first and best variety is the clear white soft kind, which may be ground easily so as to form Plaster; the second is a kind of impure whitish black ore, which is used for manure; the third is a soft pinkish kind, which could be used as a plaster but that it is apt to give the wall a streaked appearance if so used; and the fourth is of a somewhat crystalline kind resembling selenite, except that it occurs in pseudomorphs disseminated through the plaster and is sometimes of a delicate pink tint. During the winter the Company contracts with persons to get enough quarried to ship to the States in the Spring. - One ship load of the raw material has just left for Philadelphia. Ship building is also carried on to some extent, though not so extensively as in many other parts."

The Albert County Journal, Page 2 - Friday, July 31, 1903 ALONG THE LINE - Salisbury, thirteen miles form Moncton, the passenger takes the Salisbury and Harvey Railway, which runs to Albert, some forty-five miles. Leaving Salisbury, one passes by Turtle Creek and other rich farming and lumbering districts; then Hillsboro, the first place of importance, where one begins to see the beauties of the county, as the Petitcodiac river flows by the broad and fertile marsh meadows. The famous 'Cape Rocks' are near Hillsboro. The Rocks are admired by all who see them and are the greatest nature's work. The celebrated Albert Mines are near here, but they are now abandoned, and no other large deposit of the peculiar 'Albertite' has yet been found. The quarrying andmanufacturing of plaster is, however, being carried on and is the most important industry in New Brunswick. .. ... Albert County is an ideal land for the tourist and all should not fail to see the greatest piece of work on the American coast - the 'Rocks' at Hopewell Cape."

Morning Journal - Feb. 12, 1866 Rock Records of New Brunswick - A Lecture, by Professor L.W. Bailey, A.M. (continued) : The currents must have been of vast force and long continuence to build up such enormous beds. Fully 10,000 feet in vertical depth to solid rock must have been washed away, for even the old limestones and granites of Portland, the most ancient beds in the Province were laid bare and we may even find large masses of these rocks, sometimes 3 or 4 feet in diameter, worn or rounded by the power which removed them. But this power decreased as time moved on. As we rise to

the higher beds of the period we find that these currents became much less violent, the land which had been rising rapidly now became more stationary, though still falling and rising at short intervals. Of its actual extent at this period we know little, but from the occurrence of these conglomerates skirting both sides of the high ridges, which stretch from St. John eastward to Shepody Mountain, it seems probably that these ridges constitutea long and narrow island, occupying much of the presentcounties of St. John and Albert. In Nova Scotia the Cobequid Mountains formed a similar island or chain of islands while to the north and parallel in general direction, lay another narrow strip of land, now comprising the peninsula of Kingston. Still another, of even greater length, stretched through the present counties of York, Northumberland and Gloucester from the boundary of Maine to the Bay Chaleur. This land was probably but scantily covered with vegetation, which had been largely destroyed by the Devonian revolution, but the intervening shallow channels still teemed with life. Shells and corals grew in abundance and their remains, crowded together like modern oyster beds, constitute thenumerous and valuable limestone beds of this formation. Fishes, too were plenty, for many of the strata are filled with their remains. They seem to have been especially abundant about the Albert Mines, and it is to them principally, that we are to look for the origin of that highly valued and curious substance, the Albert coal. That the latter was once a fluid oil or petroleum, very similar to that so abundant in other portions of America is now almost universally believed, both on chemical and geological grounds. That it is of Lower Carboniferous and not of Devonian age is also certain, for, as we have seen, the rocks of the latter had been baked by an intense heat long before the Albert shales began to be deposited, a heat so intense that all volatile and combustible matter, such as petroleum, must have been completely driven off. Nor is there anything in those Devonian rocks from which the bitumen could have come. We can only look to the shales themselves as the source of the Albertite, and no one who has seen those shales, crowded as they are with the remains of fishes, whose mere skeletons are now left to us, can doubt that it was largely from the decomposition of their soft bodies that the oily matter, now hardened by exposure, originally came. There is another substance abundant in the rocks of this formation, which, though less valuable than the Albertite, yet deserves a passing notice. I refer to the numerous bed of gypsum or plaster, not only extensively employed for moulding and casting, but so beneficial as a fertilizer to the soils with which they are naturally or intentionally mixed. The origin of this gypsum is somewhat uncertain but the supposition of Dr. Dawson, the distinguished geologist and author, is probably the true one, that they are the result of a chemical action caused by streams of sulphuric acid flowing from volcanoes beneath the sea, and coming into contact with previously formed beds of limestones, shells and corals. But I must not delay over theoretical and uncertain facts. That shells and corals, producing limestones, did actually exist in vast numbers in the seas which then covered nearly all the central portion of the Province is abundantly proved by their remains; that volcanoes also were still active as in earlier periods, is also evident from the effects which they every where produced. Indeed this period would seem to have been particularly remarkable for the number and intensity of its igneous outbursts. Around the entire central basin they seem to have formed a burning crown, and we may still mark the spots such as Hampstead, Inniskillen, Harvey and the Keswick, where the fiery ..?.. pored forth. These volcanic disturbances were probably accompanied by oscillations of level, as indicated by the shifting nature of the deposits then formed, but upon the whole the Province was rising, and gradually assuming its present level. The interior basins were becoming more and more shallow, the islands larger and more numerous. Island seas, by being shut off from communication with the ocean, were gradually converted into salt and then fresh-water lakes, and finally into marshes in which, favored by a warm tropical climate and abundant moisture, vegetation became luxuriant, while the land was again covered with a rich forest growth. This was the period of the true Coal formation. It was a period remarkable chiefly for the large extent of the continent then above the sea, as well as for the low and level character of that portion which had been so elevated. The disturbances which mark so grandly the close of the Devonian age in New Brunswick do not seem to have affected other portions of the continent to the same degree. Few elevated ridges existed anywhere. Even the Allegheny Mountains had not yet been raised for they include large beds of Coal, which at the time of their formation must have been near the sea level. Over the central basin of America, where through the earlier age was a vast coral-growing inland sea, there were now only wide expanses of low marshy land, with here and there an island, supporting, as in our modern tropics, dense forests and jungles. In these forests and jungles, where vegetation was so rank, only the lower forms of terrestrial life found sustenance. Not that the latter was scarce, for plants, the natural food of animals, were far more abundant even then than now, but the air was not suitable for their respiration. Carbonic acid, a gas incapable of supporting life was then present in quantities in the atmosphere. Insects, such as scorpions, locusts and beetles, with reptiles, constitute the life of the forest, while in the seas were fishes, allied to our modern sharks, as well as shells and corals. But there were no quadrupeds nor birds upon the land nor whales in the ocean, for these are warm-blooded animals and require a purer air to sustain their life. It was the part of the great Co..?.. to effect this work of purification, to remove from the atmosphere the poisonous gas, and converting it into another form, to store it away in the earth for the future wants of the human race. How perfectly this work was done may be appreciated when we think of the enormous extent of the coal beds which represent the carbon then removed by vegetation from the air. The extent of the United States coal fields is 130,000 square miles, that of Nova Scotia and New Brunswick, 18,000. The thickest of the beds varies, of course, very greatly. One immense bed in Pennsylvania is 23 feet thick, and another in Pictou, N.S., 37 feet!. Now it has been calculated that at least eight feet of vegetable matter was required to make 1 foot of ordinary bituminous coal, or 12 for one of anthracite. It follows then that at least 300 feet of plant remains must have accumulated on that one spot alone, and for every six pounds of that coal of carbonic acid must have been taken from the atmosphere, rendering the latter purer by that precise amount. It is not of a curious thought that, as we sit by our fires today, we are as it were basking in the sunshine of the old Carboniferous forests, warming ourselves by the heat, and cheering ourselves by the light, stored up for our use in the earth's early days? The vegetation by which these enormous accumulations were formed was of a very different character from any now existing. There were no palms in the Carboniferous forests, no oaks nor maples nor willows, nothing indeed resembling our wooden hardwood trees. The plains were without grass, and the swamps and 13 woods without moss. The principal trees were related to the pne family, yet different from them in many important particulars. They were of large size, trunks fifty or sixty feet in length being not uncommon, and with them were associated tree ferns and rushes in vast numbers. In the great Joggins coal section in Nova Scotia there are 76 coal

Royal Gazette - Aug. 14, 1867 Cap. LVIII. An Act to ratify and confirm the incorporation of the East Albert Mining and Manufacturing Company. Passed 17th June 1867 Whereas pursuant to the terms and provisions of the Act of Assembly, intituled An Act relating to Corporations, James Blight, John Wallace, William Wallace, John Beatty, and Reverend James A. Smith, did on the second day of April in the year of our Lord one thousand eight hundred and sixty five, file in the office of the Provincial Secretary a Memorandum of Association for the incorporation of a Company to be styled ""The East Albert Mining and Manufacturing Company,"" for the purpose of mining coal, shale, asphalt, asphaltic rock, plaster or gypsum, and all other minerals whatsoever; and for raising, manufacturing and trading in oils and other illuminating and lubricating substances, and such other business as may be incident thereto, with a capital of three hundred thousand dollars, to be divided into three thousand shares of one hundred dollars each, and stating that the office or principal place of business will be established at Hillsborough, in the County of Albert; and whereas the Provincial Secretary did on the same day grant his certificate thereof in the terms required by the said Act, and did give notice in the Royal Gazette of the granting of such certificate, with the terms thereof; whereupon the said James Blight, John Wallace, William Wallace, John Beatty, and Reverend James A. Smith, became and were a body corporate and politic by the name and style of ""The East Albert Mining and Manufacturing Company,"" for the purpose in the said certificate certified, and for such purpose had all the powers made incident to a Corporation by Act of Assembly; and whereas fifteen per cent of the proposed capital stock was paid in for the purposes of the Company within two years from the publication of such notice in the Royal Gazette; but the certificate of such payment having been made, was not filed in the office of the Provincial Secretary within two years from the publication of such certificate, as required by the said Act of Assembly;- Be it therefore enacted by the Governor, Legislative Council, and Assembly. - That notwithstanding 6 such noncompliance with the terms and provisions of the said Act, the said James Blight, John Wallace, William Wallace, John Beatty, and Reverend James A. Smith, their successors and assigns, are declared to be, from and after the publication of such notice, a body corporate and politic by the name of ""The East Albert Mining and Manufacturing Company,"" with all the rights, powers and privileges incident to a Corporation by Act of Assembly; and all acts done and to be done and performed by them, and all properties, rights, powers and privileges acquired or to be acquired by them, are and shall be valid, held, used and effectually to all intents and purposes as if the said certificate had been duly filed in the office of the Provincial Secretary, pursuant to the provisions of the the said Act of Assembly."

Royal Gazette - Feb. 18, 1817 An Act for the encouragement of the Trade of this Province in Plaister of Paris, otherwise called Gypsum. -Passed the 11th of March, 1816. Whereas the Trade in Plaister of Paris otherwise called Gypsum, which abounds in several parts of the Sea Coast in the Bay of Fundy, within the limits of this Province, might, under proper regulations be renderedbeneficial to the Inhabitants thereof and promote the maritime interests of the British Empire by the employment of the Vessels and Seamen requisite to carry on the same:- I. Be it enacted by the President Council and Assembly, That from and after the first day of May next, no Plaister of Paris, otherwise called Gypsum, which shall be laden or put aboard any Ship or vessel at any Port or Place within the limits of this Province to be transported from thence to any other Port or Place within or without the same limits, shall directly or indirectly be unladen or landed or put on shore at any other Port or Place within the limits of this Province except the harbor of the City of Saint John, and the Harbor of the Town of St. Andrews, nor at any other Port or Place in the United States of America Eastward of Boston in the State of Massachusetts, nor unladen or put aboard any American ship, vessel, boat or shallop of any description at any Port or Place Eastward of Boston aforesaid, under the Penalty of the forfeiture of every such Ship or Vessel from which any such Plaister of Paris, or Gypsum, shall be so unladen contrary to the provisions of this Act, together with her Boat, Tackle, Apparel and Furniture, to be seized and prosecuted in manner hereinafter mentioned. II. And be it further enacted, That no Plaister of Paris, or Gypsum, shall be laden or put on board any Ship or Vessel at any Port or Place within the limits of this Province to be transported from thence to any other Port or Place within or without the same limits, until Bond shall be given to His Majesty, at the Office of the Treasurer of this Province, or of his Deputy, at, or nearest to the Port or Place where such Plaister shall be intended to be so laden, by the Owner or Master of such Ship or Vessel, with one sufficient surety in a sum double the amount of the value of the Plaister so intended to be shipped, estimating each ton at twenty shillings with a condition to render the same void if the said Plaister or Gypsum so intended to be laden or put on board such Ship or Vessel, shall not directly or indirectly be unladen, or landed or put on shore at any other Port or Place within the limits of this Province, except the Harbor of the City of Saint John, and the Harbor of the Town of St. Andrews, nor at any other Port or Place in the United States of America, Eastward of Boston aforesaid, in the State of Massachusetts, nor unladen or put on board any Ship, Vessel, Boat or Shallop of any description at any Port or Place Eastward of Boston

aforesaid, and the said Treasurer or his Deputy as aforesaid, shall forthwith upon the execution of such Bond give to the Master of Such Ship or Vessel a Certificate that such Bond as aforesaid has been given, which Certificate shall be kept by the said Master to be produced by him as occasion may afterwards require, and if any Plaister of Paris or Gypsum, shall be laden or put on board any Ship or Vessel at any Port or Place within the limits of this Province to be transported from thence to any other Port or Place within or without the same limits before such Bond as aforesaid shall be given, every such Ship or Vessel and the said Plaister so laden before such Bond given as aforesaid, together with her Boat, Tackle, Apparel and Furniture shall be forfeited, and shall and may be seized and prosecuted in manner hereinafter mentioned. III. And be it further enacted, That if any Ship or Vessel, on board which any Plaister of Paris or Gypsum shall be laden as aforesaid at any Port or Place within the limits of this Province, shall be afterwards found in any other place, not having such Certificate as aforesaid of such Bond as aforesaid having been given, every such Ship or Vessel and the said Plaister on board such Ship or Vessel, together with her Boat, Tackle, Apparel and Furniture shall be forfeited and shall and may be seized and prosecuted in manner hereinafter mentioned. IV. And be it further enacted, That any Bond given under and by virtue of this Act shall and may be cancelled by the said Treasurer or his Deputy as aforesaid at any time within Six Calendar months next after giving the same upon production of a Certificate from the Collector of the Customs of the Port, or from any British Consul or Vice Consul at or near such Place, that such Plaister was actually unladen from such Ship or Vessel at such Port or at a Place to the Westward of Boston aforesaid, and if the Plaister mentioned in such Bond shall have been unladen in the Harbor of the City of Saint John, or in the Harbor of the Town of St. Andrews, then and in such case upon the production of a Certificate from the said Treasurer or his Deputy as aforesaid, that such Plaister was actually unladen as last aforesaid. Provided always that in case of Shipwreck or loss at Sea, proof of the same to the satisfaction of the said Treasurer or his Deputy as aforesaid, shall be equivalent to any such Certificate as aforesaid. V. And be it further enacted, That for every Bond and Certificate hereinbefore required to be given as aforesaid, the said Treasurer or his Deputy as aforesaid shall be entitled to demand and receive the sum of ten shillings and no more. VI. And be it further enacted, That it shall and may be lawful for the said Treasurer and his Deputies or either of them and they are hereby authorized and required to seize and take any Ship or Vessel and the Plaister on board, which shall be liable to forfeiture under this Act and to detain the same, and that information shall and may be thereupon made by His Majesty's Attorney General in the Supreme Court of this Province and proceedings had to condemnation and sale according to the course of the said Court, and upon such condemnation and sale thereof, shall be paid and applied as follows, that is to say - One moiety thereof, after deducting the costs and charges of prosecution to the Officer who shall seize the same, or to the Person who shall have given information, in consequence of which such seizure shall have been made and prosecuted as the Court before which such prosecution may be had shall adjudge, and the other moiety to the Treasurer of the Province for the use of the same. VII. And be it further enacted, That any Person or Persons producing or attempting to produce, or having at any time produced any false or fraudulent Certificate, Paper or Papers, Voucher or Vouchers, in order to cancel any Bond required by this Act, or in any manner to evade the true intent and meaning of this Act, such offender or offenders shall each and every one of them forfeit and pay the sum of one hundred pounds, to be recovered and applied in the same manner as is provided in and by the third Section of an Act made and passed in the Forty-seventh year of the Reign of His present Majesty, intitled, ""An Act for raising a Revenue in this Province."" VIII. And be it further enacted, That in all cases of hardship which may arise in the continuation of and carrying into execution the provisions of this Act, relief may be had by applying to the Governor or Commander in Chief for the time being who has hereby full power and authority with the advice of His Majesty's Council, to direct the release of any seizure made, or discontinue or stay any prosecutions for penalties which may have been or may be intended to be instituted upon such terms as he may deem equitable. IX. And be it further enacted, That this Act shall not be in force until similar and corresponding provisions as near as may be in all material respects, shall be made and enacted by some Act of the General Assembly of the Province of Nova Scotia to be made and passed for that purpose with regard to all Plaister of Paris, or Gypsum which shall be laden on board any Ship or Vessel within the limits of that Province, nor until such provisions shall be published and made known by Proclamation from the Governor or Commander in Chief of this Province for the time being, to be issued by and with the advice and consent of His Majesty's Council for that purpose. X. And be it further enacted, That this Act shall continue and be in force five years, and thence to the end of the next Session of the General Assembly, and no Royal Gazette - May 27, 1874 CAP. LVI. An Act for the purpose of winding up the affairs of the Petitcodiac Mining and Manufacturing Company.Sec. Sec. 1. When property of Company 3. Conveyance of may be sold. property to be under 2. Sale of property, how made. seal of Company. 4. Proceeds of sale, how applied. Passed 8th April, 1874 Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:- 1. That when and so soon as parties owning in all two-thirds of the Stock of the Petitcodiac Mining and Manufacturing Company, shall request the Directors ..?.. the sale ..?.. and personal estate, mining leases, and all other the property and effects, rights and privileges of the Company, such request to be shewn by a document in writing, signed by such stockholders, or their agents duly authorized, the Directors, or a major part of them, may order such sale to be made. 2. Such sale shall be made under the direction of the President or such other person as the Directors shall appoint, and may be made of the whole property together, or in separate parcels, at private sale or public auction; and if at public auction, the Directors and stockholders are severally allowed to bid. 3. Any conveyance executed pursuant to such sale shall be under the seal of the Company, verified by the President's signature, and shall be sufficient for conveying and assuring to the purchaser the property and estates thereby expressed to be conveyed, free from any trusts to the stockholders; and the purchaser shall not be bound to enquire whether such sale was made pursuant to the request of the stockholders, nor responsible for the due application of the purchase money. 4. Upon such sale or sales being completed, the Directors shall forthwith realize the proceeds, and after the payment of the debts and liabilities of the Company, and defraying all the costs, charges and expenses of and incidental to winding up the affairs of the Company, including therein, if they shall think proper, a reasonable compensation to the President for his services therein, shall divide the remaining assets of the Company among the stockholders pro rata according to the amount of their stock; provided that no stockholder shall be entitled to receive any dividend unless he shall have paid all calls due upon his stock."

Morning Telegraph - Sep. 9, 1865 The Town Of Petitcodiac. - ... The Petitcodiac Mining and Manufacturing Company have their headquarters here. They have spent a large amount of money in the purchase of land, erecting a building, securing limestone and plaster deposits, and improving the property. The land obtained by the company has proved to be an excellent investment, and the extent of the plaster and lime rock which they control is almost unlimited. Steam power is used in the mill; and arrangements are making to extend their operations and furnish a manufactured article equal in quality to any in use. The stock of the company has been freely taken, and it is hoped that the enterprise will result successfully. A large portion of the stock is held in St. John, although Petitcodiac, Salisbury, Moncton, and other places subscribed handsomely. The extent of plaster and lime rock available at and near Petitcodiac is something enormous - there are mountains of it. And in this connection it may be noticed that the North River flows only a stone's throw distant from the Railway station, and that the water power on this North River would turn all the plaster mills that could be crowded upon its banks. But the buried wealth of the country adjacent to the station consists not of plaster alone; there is good reason for believing that petroleum exists within a few miles of it - salt springs are found at places not many miles distant, and in different directions, while traces of oil have been found on the surface. Large tracts of ""oil sands"" have already been secured by gentlemen who are supposed to know what they are doing... the lime and plaster deposits will yet be mines of wealth; and the probability of its becoming a great oil producing region will always make it a place of interest."

Supplementary and general 2. Capital; power to powers. increase; votes; payment 6. Shares to be personal of stock. property and assignable. 3. First meeting to organize.7. Liability for debts. 4. Annual meeting for choice 8. Forfeiture of Act, how of Directors. incurred. 9. Right of Way, how obtained. Passed 20th March, 1854. Whereas the Township of Hillsborough, in the county of Albert, possess advantageous situations for the 2 building of Mills for manufacturing Lumber, Plaster andother articles, and for quarrying Plaster, Lime Stone,Marble and Free Stone, and for Mining purposes: And whereas in order to procure the requisite capital, it is desirable to incorporate into a body politic and corporate such persons as may be willing to advance fundsfor such undertaking; Be it therefore enacted by the Lieutenant Governor, Legislative Council and Assembly, as follows:- 1. That Calvin Tomkins, William H. Steeves, and Walter Tomkins, and their associates, successors and assigns, be and they are hereby erected into a Body Politic and Corporate, by the name of ""The Albert Manufacturing Company,"" and by that name shall have a common Seal, sue and be sued, plead and be impeded, answer and be answered unto, defend and be defended in all Courts and places whatever, and shall have power and authority to purchase, hold and enjoy lands, tenements and hereditaments, for them, and their successors and assigns, and all other powers and privileges now incident to a Corporation by Act of Assembly of this Province, for the purpose of building a Mill for manufacturing lumber, plaster and other articles, and trading in the said articles; quarrying plaster, lime stone, free stone, marble, and other building materials, and trading in the same, and conveying the same to market; opening and working mines, and transacting other business connected therewith; and constructing and making such rail roads or other description of roads as may be deemed necessary for the transportation of such articles from the quarries to the place of shipment; and also that they the said Company, or a majority of them, shall from time to time and at all times have full power and authority to constitute, ordain, make and establish such bye laws and ordinances as may be deemed necessary for the good rule and government of the said Corporation, provided that such bye laws and ordinances be not contradictory or repugnant to the laws and statutes of this Province, and those in force within the same. 2. The capital stock of said Corporation shall be fifty thousand pounds current money of the Province of New Brunswick, with liberty to increase the same to the sum of one hundred thousand pounds, to be divided into shares of twenty five pounds each, to be paid in at such times and installments as the business of the said Company shall require; and every person who shall be the holder of one or more shares, shall be entitled to vote either in person or by proxy, having one vote for each share as aforesaid; and it shall be lawful for said Corporation to take lands, quarries, buildings, wharves, machinery, mining rights or privileges, in the place of money, in payment of any instalment or instalments due on any stock subscribed therein, at such valuation as a majority of all the subscribers shall fix, said payment 3 to become void if satisfaction titles or conveyances to the Corporation be not made at such a period as said Corporation may by any bye laws or vote direct after its organization. 3. The first meeting of the said Corporation shall be held at Hillsborough, in the County of Albert be called by William H. Steeves, or in case of his death, neglect, or refusal, by any two of the said Company, by giving notice in one or more Papers printed in the City of Saint John, in this Province, at least thirty days previous to such meeting, in order to organize the said Company, and for the purpose of establishing bye laws, and choosing such number of Directors as by the said bye laws may be prescribed; which Directors so chosen shall continue in office until the first annual meeting, or until re-election, or others are chosen in their stead; and the members of the said Company, or shareholders present, or appearing by proxy, shall organize said Company, establish bye laws, and choose Directors of the said Company, by a majority of votes. 4. The shareholders shall meet annually at such time and place as may be appointed and regulated in and by the bye laws of said Company, at which meeting the shareholders present in person, or by proxy, may either continue in office the Directors before appointed, or any number of them, or may elect a new body of Directors to supply the place of those not continued in office; provided always, that the omission to meet shall work no forfeiture, but the shareholders may be afterwards called together for that purpose, by one or more of the Directors of the said Company for the time being, or by any three of the shareholders. 5. The Directors of the said Company, or a majority of them shall choose a President and such other officers as they may deem necessary, who shall hold their respective offices until others are chosen in their stead; and the Directors, or a majority of them, shall have full power and authority to manage the concerns of the said Corporation, subject to the bye laws thereof, and the regulations herein contained, may appoint and employ any agent or other persons by them deemed necessary, and may declare dividends of the profits according as the interests of the Company may admit or require; but no person shall be eligible as a Director unless such person is a stockholder, and over twenty one years of age; nor shall any sale or purchase of real estate be made by them, except by consent of two thirds of the stockholders, voting as provided in Section second. 6. The shares of capital stock in the said Corporation shall be deemed personal property, and each shareholder thereof shall be entitled to a certificate for the number of shares subscribed or held by him, which certificate shall be signed by the President and Clerk or 4 Secretary of the said Corporation and shall certify the property of such shareholder in the said shares; and the shares of the said Corporation shall be assignable in such manner and form as the bye laws may prescribe, and the assignee of any share or shares shall be a member and stockholder in the said Company; and whenever any shareholder shall assign or transfer all of his stock or shares in the said Corporation, he shall cease to be a member 7. The joint stock and property of the said Company shall alone be responsible for the debts and engagements of the same. 8. Provided always and be it enacted, that unless ten per cent. of the capital stock shall be paid in for the purposes of the Corporation, and a certificate of such payment, signed and verified on oath by the said Directors, or a majority of them, (which oath any Justice of the Peace is hereby authorized to administer), shall be filed in the Office of the Secretary of the Province before the expiration of three years after the passing of this Act, the operation of this Act shall cease, and the existence of the said Corporation be terminated at the expiration of the said three years. 9. And whereas also it may be necessary for the said Corporation to obtain a right of way for a rail road or other road, over the lands of other persons, from their quarries to their wharves or place of shipment; Be it therefore enacted that in case where the Corporation cannot amicably agree with any person or persons as to the value of, or damage done to his or their lands, by the making of any rail road or other road by the said Corporation, from their said quarries to their wharves or place of shipment, then it shall and may be lawful for the said Corporation to obtain from two Justices of the Peace for the County where the said lands may lie, an appointment in writing under their hands, of disinterested freeholders of said County who shall under oath to be adminstered by either of such Justices,

appraise the fair value of the land to be appropriated for said rail road or other road, or the damages thereof, to the said party or parties over whose land the same may pass; and upon the payment by the said Corporation of the amount of such value or damages to said party or parties, or upon a legal tender of the same by the Corporation or their Attorney for that purpose appointed, it shall and may be lawful for the said Corporation, by their servants, agents, or hired men, without further notice, to constuct such rail road or other road, and to pass and repass over the same at all times and with such things and in such manner as they may think fit; provided that if the owner or owners of any such land required for the for the purpose of such rail road or other road, be absent out of this Province, or cannot be found therein, or be incapacitated by reason of insanity, infancy, 5 coverture, or other disability, to receive said money or a tender thereof, then payment by the said Corporation of the amount appraised to such absent or incapacitated person may be made into the Court of

N.B. Courier - Sep. 30, 1837 LETTER III. To His Excellency Major General Sir John Harvey, K.C.H. and C.B., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency: Resuming the subject of my last letter, and the route from Petitcodiac River along the main road to Saint John,I found the road after leaving Holstead's Inn, to pass over a considerable hill called the Portage. The rocks of this hill are sandstone of the coal measures; and among them fossil Cacta Calamide and impressions of leaves are visible where the strata appear at the surface, which in general is covered with a meagre soil. The Portage is four miles long, and although narrow and uneven, is very pleasing on account of the pretty grooves on each side, and the thick clusters of birch and maple like festoons overhanging the way. From this place the waters of the Petitcodiac find their way into Chignecto channel; while those of the Kennebecasis take an opposite direction and escape into the River St. John. This elevation seems like a barrier set up between the two streams, notwithstanding some of their ultimate branches meet each other. Sussex Vale or Pleasant Valley (names applied tothe same place by many persons) is twenty miles in length, and averages perhaps, from one to two miles in breadth. Its course is nearly southwest, and it extends from the Portage to Lyon's Inn at the mouth of the Mill Stream. The hills on each side are of grey sandstone and conglomerate which not only affords a shelter from cold winds, but reflect much heat upon the lower grounds between them. New red sandstone occupies the principlepart of the valley. This rock is, however, covered at atmany points with beds of clay, sand, and gravel.Southward there is a tract of mountainous country evidently connected with the high lands already noticed, and like them is probably composed of primary and transition formations. A large salt spring flows from thered sandstone of Sussex Vale, which notwithstanding, it has been worked on a limited scale, has supplied considerable quantities of salt. There are similar springs a few miles northward, where the saliferous rock is accompanied with beds of gypsum and limestone, extending to Butternut Ridge. It is probable that a bed of rock salt might be discovered at this place, but its 7 distance from any navigable river, would render the transportation of the article too expensive to be profitable, and therefore the springs only possess the minor advantage of supplying the country near them. Almost the whole of Sussex Vale is in a state of agricultural improvement; the uplands are excellent, and the intervale affords abundant supplies of hay. Cultivated by an industrious population, the earth sends forth her richest rewards to the intelligent and active inhabitants. Near the Church there are some beautiful spots; the winding river with its intervale, studded with elms, and the deep valley skirted with snug farms, and embraced by a chain of hills, having here and there a lofty peak - the whitened cottage - the poplar-shaded mansion; all combine to strike the eye and prove the fertility of the district. After crossing the Bridge over the Kennebecasis at Roach's farm, the hill along the north side of the road is composed of conglomerate, which extends a number of miles without being covered with other deposits. This rock may be seen well at Lyon's farm, near Millstream bridge. It is of a coarse kind and composed principally of pebbles of quartz, firmly cemented together, argillaceous matter and oxide of iron. All the pebbles have been rounded and partially polished by attrition, and from the close resemblance they bear to pebbles found in the channels of rapid streams, or on the shores of the sea, in the absence of other causes producing similar effects, there can be little doubt, they have assumed their spherical figures from being rolled by the violence or after passing along the bed of some ancient river. The present compact texture of the rock has been produced by the nature of the cement, and the pressure it has sustained. Many curious enquiries might be instituted to ascertain from whence these pebbles came, but they would be attended with difficulty, and are foreign to my present purpose. At Mill Stream bridge the valley terminates, and the hills forming its sides approximate each other so nearly, that there is only sufficient room for the Kennebecasis to pass between them. The surface of the country now becomes uneven, and although not remarkable for fertility, supports a tolerable growth of cedar and spruce. From Lyon's on the Kennebecasis to Hammond River, the conglomerate form the hills on both banks of the former. A few good farms were observed on the road, notwithstanding the soil is much inferior to the marley covering of the new red sandstone. Viewed from a hill not far from Hammond River Bridge, there is a pretty landscape, on the side of the Kennebecasis, there is a singular opening through the hill resembling a rude gateway - through this opening the farms and cottages of a small village are seen in the distance, like the 8 furniture to a house when its door is unclosed. About six miles from the city of St. John, on the road to Hammond River, the primary rocks of the chain of high land already noticed, cross the road; after having formed a series of elevated peaks, and high table land. The granite extends in a southwest direction to the Nerepis, where it is equally remarkable for its mountainous character, and sublime scenery. This formation at the spot where it is examined, is about two miles wide, but from the appearance of the mountains at a distance it evidently often extended to the distance of ten or fifteen miles in breadth. The surface above the granite near the road is low, and the turnpike has been made over boulders of that rock, these appear white from having been exposed to the weather, and fires which have occasionally overrun this portion of the country. Connected with the granite I also observed a good syenite in which the crystals of hornblende and feldspar bear very equal proportions to each other; and both rocks would supply materials for building - the Romans used syenite - both in building and architecture. Several specimens of late and epidote were procured in a fissure of that rock, which at another place was found incrustedwith the green carbonate of copper. A circumstance of much importance, and one which I hope my time on some future occasion will allow me to examine more carefully. These rocks are immediately succeeded on their south-east side by an extensive formation of primary limestone that extends in a south-west direction along the high lands northward of St. John, across the river near the Indian House, until it reaches Musquash, where it is quarried for marble. The boundaries of this most useful formation are unexplored, and but little is known of its real value and interesting minerals it contains. I have never seen limestone more highly crystallized than this, where it approaches the plutonic rocks thus mentioned. At several places where it is in contact with the granite, the marble is extremely compact, sonorous, and composed of crystals highly splendant, and white as the snow that in winter mantles the hills. Receding from the crystalline rock, the limestone becomes less and less granular and compact, until it passes by insensible shades into the transition variety, in which scarcely a solitary crystal can be perceived. These circumstances afford strong evidence in favor of the hypothesis that many older deposits of limestone have been converted into crystalline marble, by the heat applied under great pressure which accompanied the eruption of granite mountain masses from beneath. The effects then produced on the superimposed strata differ widely from those exhibited in the secondary and tertiary strata, where different chemical combinations and great pressure without the aid of volcanic agency have effected consolidation, but were incapable of producing those 9 vitreous and regular forms found in the lower rocks. It is true, that to produce crystals of carbonate of lime by artificial means, defies the skill of the chemist, but how imperfect are his manipulations, and how inadequate are his apparatus, when compared with the vast laboratory of nature, from whence whole mountains are raised in a single night, or whole continents descend into the places provided for their reception. Whatever may have been the original sources from which this limestone has been derived, it is impossible to infer that it was produced by the decomposition of older rocks, as it bears no analogy with the formations placed beneath it. Nor is it probable as some have supposed, that all calcareous strata have their common origin in the exuvia and remains of testaceous animals. It seems more rational to suppose that the lime now forming so large a portion of the earth's crust, had an origin from the hand of nature, and has only been accumulating through the medium of water or by extensive tribes of submarine creatures to which it is indispensible to form their shelly tenements. It is also necessary for the support of the vegetable kingdom, and the large quantity entering into the bones of man and other animals, naturally leads us to the conclusion that its abundance in another instance of design and wisdom of one Great Benefactor. Several varieties of marble were found in this district, some of which will vie in beauty with any ever discovered in foreign countries. Among them is a pure white with green veins, resembling the Carrara marble. At one place green serpentine was observed penetrating the calcareous rock forming the perfect Verde Antico of the Italians. Buccia marble and other varieties might be procured and may be readily distinguished even on the surface by the practiced eye. These beautiful and valuable materials for buildings and statuary, will not remain many years in their present useless state - they will soon supply the demand of foreign markets, and enter into more general use throughout the Province. The country at this place has the peculiar uneven aspect of lime districts. I wandered far from the road in the hopes of finding the entrance to some Cave, where perchance the bones of the fossil mastodon and hyena might be found in one common receptacle but disappointment followed, although such a discovery may reward the toil of a future visit. The soil, wherever the rain has permitted it to remain on the rocks, is almost sterile in consequence of being surcharged with the carbonate of lime. Those who cultivate any part of it will do well to mix it with fine sand to neutralize its caustic properties. Approaching the city of Saint John, from the eastward, the transition limestone disappears, and graywacke slate, and slate, succeed it, forming the hard and substantial basis on which the town is built. And it is singular that the capital of Nova Scotia and this its 10 rival town should repose on rocks of the same kind. At St. John, the strata also run north and southwest at some places they are almost vertical, at others they dip in opposite directions; these circumstances and the fractured state of the rocks, shew how much they have been disturbed since they were originally formed. The slate contains a considerable quantity of sulphuret of iron, and often find scales of mica, the latter giving the rock a peculiar glistening appearance. The town is built on a very uneven surface, and in order to overcome this difficulty large sums of money have been expended in making level streets, which show that its active and industrious inhabitants, amidst their commercial engagements, and various objects of enterprise, are daily rendering the city more cleanly, healthy, and comfortable, while its local situation cannot fail to render it in time one of the most important ports in America. The limestone is predominant at a village called the Indian House, situate on the River St. John, and about a mile above its entrance. This is the starting post for steam boats on the river and a kind of storehouse for the vast quantities of lumber floated down the watery turnpike of the Province. The Falls just below the village, at low water, afford a wild and sublime spectacle. The accumulated waters of the extensive and deep river, with all its lakes and tributary branches, are here dashed through a narrow opening, and over a rudely inclined plain towards the sea. Interrupted by small Islands above, and compelled to pass over huge masses of rock, obstructing a passage less than a quarter of a mile wide, the river foaming and spouting with tremendous fury, seems to assume at making its exit a most tragical character, threatening with instant death any who may venture upon its troubled bosom. But, at half-tide the scene is changed; the ocean spreads its mantle over the thundering cataract, and flowing inwards through the narrow chasm, stills the noisy rapid, and apparently to oblige the inhabitants, allows them to pass even with large ships in safety. On the east side of the falls a perpendicular wall of limestone, a hundred feet high, offers resistance to the violence of the stream, but as the current is directed on this side, it is ever crumbling down, and the river is gradually making for itself a wider and easier passage to the sea. On the opposite shore the rock is principally greywacke which makes a kind of peninsula stretching into the river and forming a considerable ""cove"" above the dangerous rapid. The ingenuity of man ever awake is about to render this local peculiarity profitable. The ""Saint John Mills and Canal Company"" have expended a large sum in opening canal across this narrow neck of land whereby they will direct a sufficient 11 quantity of water from above the falls into an expensive dam built below them and obtain immense power. The work is intended to propel twenty-four saws, and is rapidly advancing towards completion. It is the most extensive establishment of the kind in the Province, and reflects great credit on J.D. Emery, Esquire, the Agent, and the Engineer, who are engaged in its construction. From the falls to Grand Bay, four miles distant, the river passes through a deep narrow and tortuous channel, opened through hills of marble and transition limestone. I was surprised to observe that the continued action of the current, frost, drifting ice and timber has produced so little effect in forming sloping banks upon its sides, which are scarcely indented, but dip in straight lines beneath the water. When the absence of these effects, the narrow and remarkable outlet of the river, with its foaming cascade are considered, it appears probable that this site is by no means the original outlet of the Saint John, but one which has been reproduced from some geological catastrophe of which the rocks themselves bear the most unequivocal testimony. From what has already been observed I am induced to believe that the waters of this extensive river now escape into the ocean through an unnatural channel, and that its former bed was filled up by the same change in the level of the country that opened the new and extraordinary fissure through which it now passes. And I doubt not the ancient

From the falls to Grand Bay, four miles distant, the river passes through a deep narrow and tortuous channel, opened through hills of marble and transition limestone. I was surprised to observe that the continued action of the current, frost, drifting ice and timber has produced so little effect in forming sloping banks upon its sides, which are scarcely indented, but dip in straight lines beneath the water. When the absence of these effects, the narrow and remarkable outlet of the river, with its foaming cascade are considered, it appears probable that this site is by no means the original outlet of the Saint John, but one which has been reproduced from some geological catastrophe of which the rocks themselves bear the most unequivocal testimony. From what has already been observed I am induced to believe that the waters of this extensive river now escape into the ocean through an unnatural channel, and that its former bed was filled up by the same change in the level of the country that opened the new and extraordinary fissure through which it now passes. And I doubt not the ancient

North Shore Leader - Dec. 27, 1907 Mineral Resources of New Brunswick. - Development of Coal, Iron, Oil and Other Mineral Areas. - The London Times of recent date published an engineering supplement containing an interesting article on the mineral resources of Canada, from which the following is taken, relating to New Brunswick. - Quebec's eastern neighbor, the much smaller province of New Brunswick, sandwiched between the Gaspe Peninsula and Nova Scotia, claims to possess a mineral- bearing territory, though it has not been regarded as a mineral province. If local testimony is to be accepted this is because, for some unknown reason, it has never received the attention from geologists and prospectors which its people believe to be its due. It is declared that the northern part of the Province remains practically as unexplored as the centre of Africa. Through this country runs the Cambrian formation, 150 miles long by 150 miles wide, and only the lumber interests are acquainted with it. But the Province's geological department is awakening to the possibility that the unprospected regions may yield discoveries which will give New Brunswick other characteristics than agriculture and lumbering. The province's actual yield of minerals generally cannot be counted of importance, whatever its potentialities may be. No paying deposits of gold or silver have been discovered, though this may be, as indicated, because the

province has attracted few prospectors. Its coal measures in the counties of Queens, Sunbury and Kent, thus far only supply local markets. The seams are thin, not averaging more than 20 in. but they are believed to be capable of developing into much greater areas. That New Brunswick coal is not more largely mined is attributed to the proximity and wealth of the Nova Scotia coal fields, which has not been favorable to the growth of those of New Brunswick - to the extent to which they admit of such development. For the rest the Province's extensive deposits of gypsum, of a fine quality have for many years been profitably worked, iron though little developed, is present in large deposits, and is being explored near Bathurst to the"
Frank J. Horgan, P. Eng. Oct. 2000 49 Talwood Dr., Don Mills, Ont. M3B 2P4 fhorgan@home.com Frank Horgan Sr. had worked in construction most of his life, operating a 'steam shovel' or dragline, onprojects such as the Welland Canal (which led to my birth in St. Catharines, Ont.), the Navy Pier in West Saint John, strip gold mining in E. Malartic, P.Q., until the time, following the depression, and in the early World War II years, he was prospecting and found a coal seam near Coal Creek, N.B., on the outskirts of Chipman, N.B. He negotiated the purchase of a Bucyrus-Erie 50B steam shovel, on which he had worked for Brodrick Bros. Contractors, and brought it to the site to conduct open surface mining of the coal, sold by his agent Max McCarty to Canadian Gypsum Co. in Hillsborough, N.B. This workcarried on during the early 1940's, until the coal seam became too deep to allow profitable continuation. He boarded at the time at the residence of Earl W. Hine in Chipman, who ran a Ford dealership on the ground floor. One of his chief workmen was Harold Boyd, part of a crew of some 16. I don't have much more to tell you, but royalty payments had to be made to the Government at the time, and

Evening Gazette - Oct. 30, 1890 Gypsum as a Fertilizer. - We are very apt to set a high value on things which are far-fetched and dear bought, while articles of home production, of native growth, are looked upon with suspicion and counted of little use. Our annual exports of gypsum for fertilizing purposes amount to many hundreds of thousands of tons, yet hardly one in a thousand of our farmers can speak intelligently of its value either from observation orexperiment. The mines of gypsum on the Tobique have been worked for many years, and for the most part their products have been used in the state of Maine; there are inexhaustible mines in the vicinity of Windsor, N.S., the output of which goes to Boston and New York, and thence to the farmers in the interior who learned many years ago that it was one of the most economical fertilizers that could be obtained on this continent. Many of the mountains along the northern shore of the Bras d'Or, in Cape Breton, are nothing but solid masses of gypsum that, under the summer sun, gleam down on the lake voyager like mountains of snow. What is gypsum? ... (general) ... The shipment of gypsum rock from Windsor to Boston and New York, has been almost continuous for thirty or forty years. In the old time large quantities were sent up from New York to Albany, a distance of 150 miles, where it was loaded on canal boats for Whitehall at the head of Lake Champlain. There it was ground and distributed in bags of 200 pounds each to the farmers of Western Vermont and northern New York. They sowed it on their grass lands, pastures and grain fields. They steeped their corn and other grains and rolled it in the plaster before sowing or planting, and the result was most satisfactory. They also applied a handfull to each hill of potatoes at the time of planting, and again at the first hoeing and also at the first hoeing of their corn. The effect was always visible immediately after the first fall of rain. And when only a part of a field was treated to the plaster, its beneficial results were manifest at the harvest, the increase in the crop much more than paying the expense of the plaster used. The application of gypsum was never found beneficial to marsh or boggy soils, but the uplands to which it was applied were very similar in character to the uplands of this province, and if it can be used here with as good results as it has been used there, its employment should become general; farmers will of course understand that gypsum for agricultural purposes is not calcined; that is, it is ground without being burned."

Fredericton, NB, The Provincial Archives - RS/22/72 -HILLSBOROUGH PLASTER & RAILWAY COMPANY - 1853 Saint John, NB June 27, 1853 Sir: I enclose a certificate signed by a majority of the Directors of the Hillsborough Plaster & Rail Road Company - Which certificate by requirements of the charter of the Company was to be made within three years from the date of the Act of incorporation and filed in the Office of the Provincial Secretary - You will please place the same on file and oblige your servant. Respectfully Samuel Howlin To the Honourable John R. Partelow Provincial
Morning News - Oct. 24, 1855 Hillsboro', N.B., Oct. 19, 1855. - Mr. Editor -Having noticed in your paper, the ""Morning News"", of the 20th inst., the remarks ""transmitted"" to your Journal concerning the visit of His Excellency Lieutenant Governor Sutton to the county of Albert, I will now, in addition remark for the benefit of those interested, that the Plaster Quarries alluded to, and so obscurely indicated were those belonging to the ""Hillsboro' Plaster & R.R. Co.,"" and that the enterprising and gentlemanly manager, Mr. Blight, in my partial absence, conducted His Excellency and friends to the principal parts of the Quarries, explaining and pointing out their uses, formations, &c., and I believe his Excellency was well pleased with his visit. I will also say that the facilities of this Company, as regards means and material, are ample; they are, and have been, doing a prosperous business since the commencement of their operations, and they can furnish as pure and white an article of Plaster, and in as large quantities, as any other Company or persons in this Province. Yours,
Carleton Sentinel - Aug. 3, 1861 The St. John Courier states that a sum of $30,000 has been expended by Messrs. Tompkins, of New Jersey on the Plaster works at Hillsboro; and that they are capable of yielding 1000 barrels a day the same plaster being worth 35 cents a barrel, and the Calcined Plaster for building purposes $1 a barrel."
Morning News - Feb. 6, 1861 Albert County. - ... Mr. Duval was then introduced. His subject was ""Albert County - its Mountains, Mines, Minerals, Manufactures, Marshes and Mud."" ... The lecturer then proceeded to describethe Plaister Quarries; the mode of Quarrying; the Plaister Mills and Wharves; the Mills, he was informed, would cost £20,000, and were the largest in America. These works were also owned chiefly by Americans, and he considered it matter of much regret that when an opportunity offered to our capitalists to become interested in these works they had not taken advantage of it. Of course men had a right to dispose as they pleased of their own, and mining operations were but speculations at best, but he could not help thinking that ""nothing risked nothing gained."""
Morning News - Oct. 2, 1861 Burglary. - Albert Quarries. - During the night of Saturday, 21st ultimo, the store of the Albert Quarries was broken into by burglars, when two barrels of flour, some tea and tobacco, were stolen. Also the front door of the ex-manager's house was tried. This probably was done by the depredators, with a view to ascertain whether the inmates were asleep, before they attempted the store. It was entered by forcing the lock with a hatchet or some such instrument. The whole affair is wrapt in mystery, there having been no search warrant obtained. The Island, on which are situate the quarries is isolated and lonely, which, taken in connection with the terrific storm of wind and rain which raged that night, renders it more than probable the deed was committed by parties well acquainted with the premises. It is reported that the proprietor has already been notified that there are some matters which require attention, therefore it is to be hoped that

should this paragraph come under his observation, no reason will prevent immediate attention. - [Communicated."
S.J. Daily News - Apr. 29, 1863 A young man named Joseph Morang, a native of Lubec, Maine, was instantly killed at the Plaster Quarries, Hillsborough, on Wednesday last, by the falling of a piece of plaster on his head as he was engaged at his work. Deceased is described as a sober, industrious young man, who, during two years residence at Hillsborough had made many friends. His remains have been sent on to his relatives. - GLOBE"

S.J. Morning Journal - Apr. 8, 1867 The Hillsboro' Plaster Mills, which have been stopped during the winter, are again in operation."

Daily Telegraph - Aug. 5, 1869 Albert County. - Hillsboro. - Hillsboro, in Albert County, is a flourishing village, having a population of 1000 inhabitants. The Plaster Quarries and Mills give employment to upwards of 70 men and boys. Mr. Tompkins is the superintendent of the works. The Quarries are located about 3 miles to the southwest of the Mills, and the Plaster is brought to the wharf by a horse railway, where it is put through a process and made into fine coating or putty. In connection with the mills there is a Stave Machine which employs about 9 men, and cuts a large number of barrel staves each day. Mr. C.J. Bliss has charge of this branch of the work. There are about 12 coopers constantly employed in making barrels for holding the plaster. ..."

Daily Telegraph - Oct. 7, 1869 ...The destruction caused by it to the Albert Manufacturing Company exceeds $20,000; carrying away wood and lumber, wetting the calcined plaster, it swept away every thing about the Mill - buildings, cooper's shop, cars, staves, track - tearing up all the floors in the Mills."

Codes: HILL / IDX_Names:Grey Brook Gypsum;
Daily Telegraph - Oct. 12, 1869 Albert County. - Samuel Gross, Esq., Hillsboro' writes to us, under date of Saturday, to say that the loss sustained by the Albert Manufacturing Co., in the late storm, was nothing like as heavy as represented in his letter published in this journal; and to intimate that the estimate of the loss was his own and not Mr. C.T. Tompkins, as might be inferred from his letter. No doubt, the estimates formed of damage sustained by the individuals and companies, - formed, probably, in the bustle and confusion of the day immediately succeeding the great storm, will be considerably modified as the real facts of the case become better known."

Eastport Sentenil - Jul. 3, 1872 Hillsboro Plaster Mills Burnt. - The Tompkins Plaster Mills at Hillsboro, N.B., were destroyed by fire on Saturday last. The loss was reported at $100,000. We hear that there was no insurance. The machinery, it is thought was not entirely ruined. The fire was accidental. Those mills have given much business to vessels and the loss will be largely felt. The shipping of this town will feel the loss severely."

Carleton Sentenil - Jun. 1, 1872 ADVERTISEMENT: Farmer's Plaster!, 25 casks Albert County Ground Plaster. For sale low W.F. Smith Woodstock, May 31, 1872 -- li-pd-22"

Daily Tribune - Jun. 29, 1872 The Hillsboro Fire. - The buildings of the Albert Manufacturing Company at Hillsboro, which were destroyed by fire Thursday night were built at a great expense and the buildings and machinery were valued at a hundred thousand dollars. There were three mills, one for grinding grain, one for sawing lumber, and one for plaster crushing. One hundred and fifty men are thrown out of employment by the disaster."
Colonial Farmer, Page 2 - Monday, November 25, 1872 NEW BRUNSWICK - The building of the new plaster mill at Hillsboro is rapidly advancing."

Morning Freeman - Aug. 2, 1873 The Albert Manufacturing Company's Mills at Hillsborough, which were destroyed by fire last summer, have been rebuilt, and Hillsborough can now boast of having one of the largest Plaster Mills in America."

Daily Tribune - Mar. 18, 1873 Legislature. - ... Mr. Ryan, a Bill exempting the Albert Mining Company from local taxation for a certain period; ... He also laid before the House a ... detailed account of the expenditure of $4,000 for purchasing a Diamond Borer. ..."

Daily Telegraph - Oct. 10, 1873 The Hillsboro Plaster Mills. - The Moncton Times says that ""Messrs. Tompkins & Co. have so far advanced the rebuilding of their plaster mills at Hillsboro as to commence grinding the present week. Several improvements on the old mill have been made and alterations effected, placing them in possession of many advantages not had in the old one. Mr. E. Davis, who is foreman on the premises, says the rebuilding and fitting will cost some thirty five thousand dollars, and when the mill is in full operation it will prepare about five hundred barrels of the plaster per day for shipment. All the requisite machinery for sawing and shaping the staves, etc., for the barrels are in connection with the mill, from which the barrels are made.""

Eastport Sentenil - Oct. 22, 1873 We learn that Mr. Tompkins of Hillsboro, lately one of the partners in the extensive plaster works at"

Daily Telegraph - Oct. 29, 1874 Hillsboro. - ... in this locality, at some distance on the east of the post road, are the large plaster mills of the Albert Manufacturing Company, which have contributed so much to the prosperity of Hillsboro. ..."

Codes: HILL / IDX_Names: Grey Brook Gypsum;

Daily Telegraph - Oct. 30, 1874 Albert County. - Hillsboro Parish. - ... The Plaster Mills. - In Hillsboro is located the only considerable ""Plaster of Paris"" manufacturing establishment in the Lower Provinces. The Albert Manufacturing Company, incorporated by Act 1854, by petition of the late Hon. Wm. H. Steeves, Calvin Tompkins and others, was burned out, with total loss, in 1872, and rebuilt and in operation in the autumn of 1873. The works and property of this establishment comprise quarries of gypsum, three or four miles of railroad; wharves upon the Peticodiac River, and a steam mill and other buildings and storehouses, comprising a rock plaster storehouse, 120x40 feet; plaster mill, 40x41 feet; calcining house, 69x48 feet; trimming room and cooper shop, 70x35 feet; storehouse for hoops, barrel stock, etc., and stave and heading saw mill, 100x50; engine and boiler room, 60x79 feet, all three stories in height. The mill is furnished with two rotary vertical crushers, with elevators; four run of four feet Esopus grit mill stones, with elevators. Adjoining, and at right angles with the mill, is the calcining house, through the upper story of which the ground plaster is distributed by a conveyor belt from the mill elevators; thence it is drawn from the mill elevators; thence it is drawn through spouts into the calcining cauldrons, of which there are four, each of about 55 barrels capacity, well set in cement bound masonry. The smoke flues are peculiarly arranged, and pass under the ground to a large stack outside of all buildings, which stack takes the smoke from all fires about the works. The barrel staves are sawn upon cylindrical saws, of which there are two, and are joined upon ""Hall's"" variable Jointer. The heading bolts are worked up with a ""Muzzy Shingle Machine"", adapted for the purpose. Both the floor above the saw mill, is the machinery for turning the heads ready for the barrels. Upon the lower floor the staves are selected, set up, windlassed, and fired. The windlassing is done by steam power, and the barrels are fired upon a row of cylinders, set over a flue with a fire furnace, opening into the same fire-room as the steam boilers. The steam boilers are fine, four in number, about 30 feet long and 3 feet in diameter. These are well hung, and masoned in with an arch over the top. The heat returns over the top of the boilers. The fire under each pair of boilers is double, the rear fire being supplied with refuse from the saw mill, dumped in between the boilers through traps in the arch. Over these is a twilled wire spark arrester. The power is communicated by a double non-condensing engine, with cylinders eighteen inches in diameter, and three feet stroke, being a nominal power of about one hundred and ten horse, with steam of 75 pounds. Above the engine room is the carpenter and machine shop, where most of the repairs both in metal and in wood are done. Detached from this pile of buildings is the blacksmith shop, and upon the wharf is a large storehouse. Upon the highway is the office and a store for general merchandise, and near by, pleasantly situated upon the top of a gentle slope, is the residence of the general agent. The number of hands usually employed is from one hundred to one hundred and twenty, including many skilled mechanics. This industry has not been a financial success, owing to various causes but chiefly owing to the cunning policy in the States (where the principal market is), which admits raw materials free from duty and taxes out foreign manufactured products. However obscure the result of this enterprise may be financially to the capitalist, no doubt can exist as to its influence upon the prosperity of the surrounding neighborhood, and the wisdom of such public action as would encourage this manufacturing industry. In Nova Scotia and New Brunswick are the only known deposits of Gypsum (suitable for calcining) on the Atlantic seaboard, and east of Lake Michigan. In Virginia and New York are found small formations of brown earthy gypsum, without market value in itself, and, moreover, so remote in the interior that even with an additional charge of two or three dollars per ton, provincial plaster would be the cheapest. There were shipped from Nova Scotia to the American Atlantic seaboard, manufactured in 1870, about 148,000 tons of rock plaster, valued at about $148,000. This rock plaster, when manufactured, possessed a value of about $900,000. This difference between the two values, say $752,000, is value for labour which would have long since been employed here, in Nova Scotia and New Brunswick, but for the American policy of taxing the manufactured article (and in it our labour) one fifth, and admitting the raw material free of duty. Under ordinary conditions no relief for these circumstances could be obtained excepting in a more perfect understanding of the economical theorem, that in the freest commercial intercourse may be found the greatest public good. But as the industry in the Atlantic States is now entirely based upon Nova Scotia and New Brunswick rock, with no other known available source of supply, an export duty upon rock plaster to protect this industry here, would be followed by some of the following results, viz.; 1st. Either the American manufacturers would pay the duty - in which case this Government would get a large revenue, and at the same time encourage an important manufacturing interest - or, 2nd. the American manufacturer would manufacture in this country; 3rd. the American capital would be withdrawn from this pursuit, in which case, as Plaster of Paris is a staple commodity of well recognized economic value, both for the soil and in the arts and manufactures, no reason is apparent why other capitalists should not seek this business as an investment."

Moncton Daily Times, Page 4 - Saturday, August 25, 1877 HILLSBORO ITEMS - An interesting event took place on Thursday evening at the residence of Mr. J. T. Tompkins, being the marriage of Mr. C. J. Osman to Miss Laura, eldest daughter of Mr. J. T. Tompkins, Manager Albert Manufacturing Company. The happy couple left by special train at 10:00 p.m., en route for the Upper Provinces. A few invited guests accompanied them as far as Salisbury."

Moncton, The Daily Times, Page 2 - Friday, December 14, 1877 Hillsboro, December 13, 1877 - The Albert Plaster Company have commenced grading on a new railway to their quarry. Mr. Bruce is the contractor. The line will be about 2 miles long when completed."

Daily Times - Dec. 14, 1878 Plaster Works. - The gypsum mill operations are now about closed for the season, and although many operatives have been employed during the summer and fall, yet many, perforce of circumstances, will be out of employment during the winter season. This seems unfortunate, but there is no remedy."

Moncton Times - May 25, 1878 Tompkins - plaster manager at Hillsboro ..."

Codes: HILL / IDX_Names: Grey Brook Gypsum;
S.J. Daily Telegraph - Jan. 15, 1879 Albert Mining Company. - At the annual meeting of the Albert Mining Co., held this afternoon, the following directors were chosen: Messrs. Henry Gilbert, John Byers, Bradford S. Gilbert, Alexander Duncan, and James S. Gilbert. At a meeting of the directors immediately afterwards the following officers were elected:- Henry Gilbert, president; S. Schofield, secretary; John Byers, consulting engineer."

Chignecto Post - Aug. 5, 1880 Albert Co.- The plaster mill of the Albert Manufacturing Co. at Hillsboro', resumed work on Tuesday, having been shut down about four weeks. Four schooners are at present at the wharf to load plaster for the United States."

Daily Telegraph - Aug. 16, 1880 Albert Co. - The Albert Manufacturing Co. have resumed work, and are now loading four large schooners."

Chignecto Post - Aug. 19, 1880 Albert Manufacturing Company.- This company are at present employing quite a number of men in their mill, at their quarry, on their railroad from their quarry to the wharf, and on their wharf. All these develop quite a praise worthy enterprise, and make quite a hum; but the opening of a new road, and the attempt to incorporate a new company free from taxes, made a greater hum. Rumor has it that this enterprising company propose building this winter a large vessel of 400 to 500 tons. Such an industry would be a great benefit."

Daily Sun - Dec. 4, 1880 Killed in a Plaster Quarry. - Our special correspondent at Hillsboro, Albert Co., telegraphed last evening the particulars of a sad and fatal accident which took place at the plaster Quarry of the Albert Manufacturing Company, whereby John Clark of Hillsboro was almost instantly killed. It seems that the deceased was working on a platform raised some twenty feet from the bottom of the quarry, when a large rock of plaster fell from a cliff above him. The rock dislodged the unfortunate man from the platform and he fell to the ground below, the fall causing almost instant death. The deceased leaves a wife and family."

Daily Telegraph - Dec. 6, 1880 Fatal Accident. - A man named John Clark was killed today, almost instantaneously, in the quarry of the Albert Manufacturing Co. He was in company with another man engaged in drilling rock for blasting at a height of about 20 feet. Some rock from above them came rolling down, when Clark, in trying to escape the falling rock, lost his balance and fell to the bottom. He lived a very few minutes after the fall. Life was extinct before a physician reached the place. His remains were brought out to Hillsboro on the engine, and thence conveyed to his home. He leaves a wife and several small children to mourn their loss. Much sympathy is felt for them."

Chignecto Post - Dec. 9, 1880 Fatal Accident. - John Clark, of Hillsboro, waskilled on Thursday afternoon, while engaged at the Plaster Quarry of the Albert Manufacturing Co. The deceased was working on a platform raised some twenty feet from the bottom of the quarry, when a large rock of plaster fell from a cliff above him, causing him to fall and killed hin instantly. He leaves a wife and family."

Weekly Freeman - Dec. 11, 1880 Fatal Accident. - A man named John Clark was almost instantly killed at a plaster quarry at Hillsboro, A.C. on Friday of last week."

Moncton Daily Times - Jan. 20, 1880 Albert Co. - Plaster Rock. - Mr. Blight, of Hillsboro', has several teams engaged in hauling plaster from his quarry to the wharf."

Daily Telegraph - Jul. 16, 1880 Death of Mr. Blight. - After a long illness, which is most painful towards its close, Mr. John Blight, of Hillsboro, died last Thursday morning. He was a native of England, but has been in this country for many years. For a long time and up to the time of his death he was engaged in mining and quarrying operations in this county and in connection therewith expended large amounts of money. He was straightforward and reliable in all his dealings. He was a useful citizen and, therefore, will be greatly missed. He leaves a wife, son and daughter to mourn their loss. His remains were followed to the cemetery by a long procession. His funeral sermon was preached on Sabbath morning last by Rev. Mr. Hamilton, who chose for his text Eccles. 12,7."

Moncton Daily Times - Mar. 20, 1880 Albert - The Albert Manufacturing Co.'s mill is again at work, giving work to a good number."

Chignecto Post - Mar. 25, 1880 Albert Items.- ... The plaster mill at Hillsboro' has commenced work."

Codes: HILL / IDX_Names: Grey Brook Gypsum;
S.J. Daily Telegraph - Dec. 19, 1881 Quarrying. - Mr. James Blight, of Hillsboro, is engaged at putting an engine into his plastering quarry. This will be invaluable as a means for passing out the water as well as for hoisting the rock. This quarry lies around a small lake near Hillsboro, and yields rock of superior quality and whiteness."

Moncton Daily Times - Jan. 14, 1881 The Albert Manufacturing Company at Hillsboro have built a drug store at that place. Mr. Smith, of St. John, is the druggist. The company are also about to erect a tannery near the Plaster Mill. A circular saw has been placed in the Plaster Mill and lumber is to be manufactured. Logs are being daily brought by rail to the mill."

S.J. Daily Sun - Oct. 11, 1881 Hillsborough and Its Industries - The Plaster Mills. - Hillsborough is an important parish... The most important industrial establishment of the place are the works of the Albert Manufacturing Company, which quarry and grind plaster and manufacture lumber. The company is working two quarries with a face of 50 feet, the plaster being found in large masses on the surface. It is blasted out and then hauled to the mill over a branch railway and the main line. There are three branch lines connecting the works with the company's wharves. A locomotive is kept constantly employed by the company in hauling plaster and lumber. This plaster mill was erected some twenty-five years ago, and was burned down twelve years ago, after which the present buildings were put up. There are a plaster mill and a saw mill. The power for both is supplied by an engine of 80 horsepower. The plaster, after having been blasted out and brought to the mill, is dried in a shed, and then run through crackers and stones, by which it is completely pulverized. It is then known as ground plaster. This is conveyed into large iron boilers, of which there are four, where it is calcined. Each of the boilers holds fifty-five barrels, and the calcining process requires half a day. Elevators are used for conveying the plaster from one place to the other. It goes by an elevator from the crackers to the stones, and from the stones to the bins, and falls from the latter into the boilers. It is lifted from these by an elevator to the screens, which remove all stony particles, and then goes to the barrels for packing. A ton of rock makes six barrels of calcined plaster. The company will ship eleven to twelve thousand barrels of calcined plaster to Boston this season, and eight to ten thousand tons of rock to its plaster mill in Newark, N.J. The duty on calcined plaster in the United States is twenty per cent., which has the effect of giving that country a large part of the work of calcining which would otherwise be done in this Province. The duty of 45 cents a barrel which has been put under the Canadian National Policy has not led to any increase in price, but has enabled the company to send a largely increased quantity to the Upper Provinces, this year's increase being 1,000 barrels. The company complains that the freight on the Intercolonial is higher than it should be on an article of this kind, and urges that a lower freight would enable it to sell a vastly greater quantity in Quebec and Ontario. The freight, it is claimed, should be as low as the coal freight, at least, and if it were, all the cars which come here with flour could be given return loads of calcined plaster instead of being sent back empty, as they are in many cases. It is a natural product, and a cheaper and a lighter product than coal, and the hoppers in which the latter is sent have to be brought back empty. For these reasons it is claimed that the freight should be reduced considerably. The company's saw mill is a rotary, and furnishes deckloads of lumber for the vessels that carry away the plaster. One million feet of lumber has been shipped this year. A barrel factory in connection with it is turning out 200 barrels a day. The manager of the works is J.T. Tompkins, Esq."

Codes: HILL / IDX_Names: Grey Brook Gypsum;
Chignecto Post - Oct. 13, 1881 An Albert Industry.- Gypsum Deposits of Hillsboro'.- Sketch of Plaster Works.- How the Trade is Affected by Government Policy.- One of the leading industries in New Brunswick is the Plaster Works at Hillsboro'. An extensive deposit of gypsum of a very superior quality exists on the surface three miles west of the Petitcodiac River. About twenty-five years ago, an American capitalist having become possessed of it, erected mills at a convenient shipping point at Hillsboro', for its grinding and calcining, and the article was exported to various cities on the Atlantic sea-board. Twelve years ago the mill was consumed by fire, and though the company that then owned the property had lost some $100,000 of their venture, nothing daunted, they at once rebuilt. The twenty per cent. Duty placed on manufactured plaster by the American government has killed it as a successful undertaking, but the company with indomitable pluck has steadily manufactured it and shipped in the face of the duty. The loss incurred by such duty has in part been compensated by the establishment of a mill at Newark, New Jersey, where the rock plaster is shipped to the extent of from 8,000 to 10,000 tons yearly and ground for the New York market. The operations of this company are a notable instance of capitalists pursuing for years a losing venture in a forlorn hope that the tide will someday turn. Still there ought to be money to the people of the Maritime Provinces in the sale of this article, as Nova Scotia and New Brunswick are the only sources of supply open to the Atlantic cities. It can only be bad fiscal tariffs or unnecessary competition amongst the owners that makes the business a profitable one even at its best. Various remedies have been proposed from time to time to place this industry on a paying basis. The N.P. imposed a duty of 45 p.c. on the American article. This has a tendency to exclude Oswego article from the Ontario markets, but it has only in a very limited degree assisted Maritime plaster. The increase of shipments west this season will be only 1,000 bbls. From Hillsboro'. Probably there is some increase from the quarries of Cape Breton to Montreal, but in the totals, the duty has proved a very inadequate remedy. Another method of dealing with it has been suggested and that is, to place an export duty on the rock

plaster. The immediate effect of this would be to neutralize the American duty on the manufactured article as thus stimulating its export. This would tend to the erection of more mills in the Province, to the transfer of the manufacturing here, to the employment of more labor and capital in it and lead to more profitable results generally. Whether, however, the American Government would not meet such a move by piling on heavier duties on the manufactured article is a point worth considering. The want of an American market, has led Mr. J.T. Tompkins, the Manager of the Company, to look for a market in Ontario, where an unlimited demand could be created for it as a fertilizer. The peculiarly dry atmosphere of that province has a parching influence on the soil, making a moisture-attracting substance like plaster very promotive of vegetable growth. Unfortunately, however, for Mr. Tompkin's project, railway tariffs prevent any but very limited consignments there. Plaster is a product of nature, and Mr. Tompkins claims it ought to be classified the same as coal, &c., and forwarded at as low rates, if not lower. As the value of coal is at least 100 per cent. More than plaster at the pit, the discrimination in rates ought not to be against plaster. Mr. Tompkins states that not only is coal carried more cheaply by rail, but flour also. For example, the transportation of a car load of plaster to Toronto costs $45.20, which is about ten dollars more than a car load of flour from Toronto. Trains of flour cars return west empty, which Mr. Tompkins claims he could fill with plaster, provided he was granted the same rates as the flour dealers of Ontario. He claims he could add considerably to the receipts of the Intercolonial with but slight increases of expenses, if the plaster was placed even on a footing with the flour trade. Mr. Tompkins views are worthy of consideration by the Railway authorities, not only for the purpose of giving new life to a struggling industry, and to promote the agricultural interests of Ontario, but as an element of traffic on the Intercolonial. The highest purposes of the policy inaugurated by the country in 1878, would be fulfilled, were the natural resources of the country made by it to contribute to its wealth and prosperity. If a business that grosses say a hundred thousand dollars yearly could without any unnatural stimulus be increased to half a million, it would reflect no discredit on the administration. Gypsum is simply lime with the addition of sulphuric acid and water. The proportions are as follows:- Lime… 32.56 Sulphuric acid… 46.51 Water… 20.93 How plaster operates as a manure has never yet been definitely settles. Sir Humphrey Davy supposed it to act directly as a nutrient to the crops, whereas Leibig advanced the theory, it fixed the ammonia of the air and conveyed it to the roots. At any rate its value as a manure results from its solubility in water, although it possesses this power only to the extent of one part to 461. Experience proves it to be most valuable to clover crops. The imports of plaster into Canada in 1867 was as follows:- 11 Belleville… $ 331 Brandford… 269 Hamilton… 291 Kingston… 369 London… 263 Montreal… 711 Quebec… 441 Sarnia… 342 Toronto… 3,673 Other ports… 2,926 -- $9,616 Of this, the United States supplied $8,741 and England $965. The imports in 1880 of ground plaster were:- lbs. Value Ontario… 1,035,768 $3,304 Quebec… 110,000 603 Nova Scotia… 2,250 10 New Brunswick….. 412,876 1,854 Manitoba… 10,800 63 British Columbia… 80,800 505 P.E. Island…. 960 6 – 1,652,454 $6,550 The following were the imports of calcined plaster:- lbs. Value Ontario… 508,374 $1,747 Quebec… 22,700 23 Nova Scotia… 3,700 17 New Brunswick… 77,602 286 Manitoba… 57,000 191 British Columbia... 10,500 70 P.E. Island... 7,800 43 – 667,676 $2,377 All from the United States. The following are the value of the exports of ground plaster in 1880 to United States:- From Ontario... $ 199 Nova Scotia... 225 New Brunswick... 8,917 – 9,341 The following shews the tons and value of crude gypsum shipped to the United States the same year:- Tons Value From Ontario... 703 $ 1,025 Nova Scotia... 109,409 87,440 New Brunswick... 9,756 10,038 – 119,868 $98,503 The Ontario markets are supplied in some extent from Oswego, Port Hope importing and grinding about 5,000 tons a year. The operations of grinding and calcining are very simple. The plaster after being blasted and quarried, is carried by rail to the mill. It is first placed in a drying shed; then it is placed in the rock crackers - a sort of coffee mill - from which it is carried to two runs of stones. It is then screened or bolted. From the screens it goes to the kettles, where it is calcined. Calcining is merely driving off the water from it by heat. The kettles are iron, and each hold 55 barrels. There are four of them. The process occupies half a day, so that the capacity of the mill is over 400 barrels a day. The mill is at present running from 100 to 200 barrels a day. Elevators take the material from the crackers to the stones, from there to the screens, form there to the kettles and from there to the barrels, where it is packed. There are three sidings to the several wharves of the Company. The first one is exclusively for barrel plaster, the second one for lumber, wood, ship-timber, &c., and the third is the rock plaster wharf. Last year the Company erected a rotary saw mill driven by the mill engine. They saw this season a million feet, which they send off as deck loads. They have also a barrel factory, having stave saws, trimmers, headings, &c. There engine is 80 horse power. It has four large boilers. The mill refuse furnishes the fuel. The mill and quarry employs from 60 to 100 men. The Hillsboro' gypsum has a high reputation for purity. Much of it is pure alabaster, and presents a very handsome appearance. Its extreme brittleness prevents its use for works of art. It is used in the finest kinds of architecture and occasional carloads of it for this purpose are shipped as far West as Detroit, St. Louis and Chicago. It is probably the finest on the Continent. It is used under the

Chignecto Post - Dec. 14, 1882 Albert Manufacturing closed for season....."

Weekly Transcript - Oct. 11, 1882 Dorchester - The schr. Robbie Godfrey has gone to Hillsboro to load plaster for Newark,

Chignecto Post - Oct. 19, 1882 Surrey.- Our harbor here last week presented quite a lively appearance. Thirteen vessels were in port, the most of which were loading plaster, from the Albert Manufacturing Company."

Moncton Daily Times - Oct. 27, 1882 Albert. - Thirteen vessels were in port at Surrey in the week ending 14th inst., the greater number of which were loading plaster for the Albert Manufacturing Company."

Moncton Daily Times - Apr. 16, 1888 Albert Co. - The Albert Manufacturing Company have commenced hauling plaster rock from the quarry to the mill at Hillsboro."

Moncton Daily Transcript - Apr. 26, 1888 and Daily Times - Apr. 27, 1888 The plaster trade. - Two more cargoes of plaster were brought to Moncton from Hillsboro this morning. These will probably be the last loads brought this week, as a large vessel is now loading at Hillsboro for the American market and is taking all that the Albert Manufacturing Company will be able to grind for several days to come. This trade promises to assume larger proportions this season than in any previous year. Since the opening of navigation, only a few weeks ago, 13 scow loads, containing 2000 barrels, have been brought to Moncton. All of this plaster, with the exception of three or four carloads, was sent to the upper provinces."
S.J. Daily Sun - Aug. 3, 1888 The Albert Manufacturing Co. have discontinued the shipment of plaster by scows to Moncton, having made arrangements for its transportation over the Albert railway."

Moncton Daily Transcript - Aug. 8, 1888 PLASTER SHIPMENTS.- The shipment of plaster from the Albert Mfg. Co.'s works at Hillsboro in scows to Moncton for transportation over the I.C.R. has not been entirely discontinued as was stated some time ago. The plaster will not all be sent over the Albert railway, as a cargo was brought up the river to-day and it is said that others are to follow."

Albert Maple Leaf, Page 3 - Thursday, August 16, 1888 HILLSBORO ITEMS - The Albert Manufacturing Company has renewed shipments of plaster by scow, having used the railway 3 days it is said."

Albert Maple Leaf, Page 3 - Thursday, August 16, 1888 HILLSBORO ITEMS - The Albert manufacturing Company are doing a very extensive business in the plaster trade this year. Besides calcining great quantities, they are exporting to the U.S. a very large amount of rock plaster. Twelve schooners were loaded here not long since, in just 12 days, the schooners being on the whole more than average size."

Daily Times - Aug. 17, 1888 The Albert Mfg. Co. are doing a very extensive business in the plaster trade this year. Besides calcining great quantities, they are exporting to the U.S. a very large amount of rock plaster. Twelve schooners were loaded at Hillsboro not long since, in just 12 days, the schooners being on the whole more than average size."

Moncton Daily Times - Aug. 17, 1888 Albert Co. - The Albert Mfg. Co. are doing a very extensive business in the plaster trade this year. Besides calcining great quantities, they are exporting to the U.S. a very great amount of rock plaster.

Twelve schooners were loaded at Hillsboro not long since, in just 12 days, the schooners being on the whole more than

Moncton Daily Transcript - Aug. 23, 1888 PLASTER SHIPMENTS.- A scow load of plaster arrived Tuesday night. The cargo consisted of 250 barrels. Owing to the disagreeable weather yesterday they were unable to discharge it. Since April two scows have been employed in this trade and have brought upwards of 18,000 barrels from Hillsboro to this port for shipment principally to the Upper Provinces. It is intended to bring at least 18,000 more barrels up by scows before the port closes and another scow, which is now engaged in carrying wood for barrel making from Sodom to Hillsboro, will be put

Moncton Daily Times - Dec. 5, 1888 Unusual Tides. - A quantity of lime in the warehouse on the wharves was more or less injured. Some 500 barrels from the Hillsboro works were stored in the warehouses on Harris' wharf, and the contents of about 100 barrels were injured, though not seriously, as the water only rose a few inches in the building."

Daily Times - Dec. 6, 1888 Big Shipments of Plaster. - Mr. O'Shaughnessy, the agent in Moncton for the Albert Manufacturing Co., handled and shipped to points in the West over the I.C.R., in two days recently, 2,000 barrels of calcine. Capt. John H. Wright, who has been scowing plaster from Hillsboro to Moncton all summer, has finished for the season. He has now handled 21,000 barrels. This does not, however, nearly represent the output of the works, as Messrs. Scott and Balser, have also been engaged scowing, and large shipments have been made by vessels direct from the works to St. John, Montreal and other points. The plaster brought to Moncton in scows has all been for transhipment over

Moncton Daily Times - Dec. 13, 1888 Albert Co. - The Albert Manufacturing Co. are loading their new vessel with their extra white gypsum. This grade is worth about four dollars and fifty cents per ton at the wharf."

Codes: HILL / IDX_Names: Grey Brook Gypsum;
Moncton Daily Times - May 25, 1888 Albert Co. - The A. Mfg. Co. plaster mills at Hillsboro are doing a large business this year, and turn out about 409 barrels of plaster per day."

Moncton Daily Times - May 29, 1888 Plaster Shipments. - A scow load of 250 barrels of plaster from Hillsboro was unloaded at the wharves yesterday for transhipment over the I.C.R. Another is expected up today and two more tomorrow. This trade makes considerable work here."

Moncton Daily Transcript - Sep. 21, 1888 J.T. Tompkins is laying a new track from the plaster wharf at Hillsboro to his quarries and purposes in the near future to use an iron horse to haul the plaster to the wharf from the quarries."

Moncton Daily Times - Sep. 24, 1888 Plaster Shipments. - The tern schooner Magellan, Captain Irvine, has been chartered by the Albert Mfg. Co., Hillsboro, to carry a cargo of plaster to Montreal. The schooner will take about 3,000 barrels. The Albert Mfg. Company are deserving of credit for this venture in developing interprovincial trade. The schr. Hattie C., Capt. Stewart, sailed for Hillsboro on Saturday to load cargo of plaster for Newark."

Moncton Daily Transcript - Apr. 10, 1889 PLASTER SHIPMENTS.- The Albert Manufacturing Co., of Hillsboro, has renewed the shipment of plaster by water to Moncton and thence by rail to destination. One scow came up the river this morning and discharged at the public wharf, and others are expected by this afternoon's tide. Two scows were engaged in this business last summer, but owing to the increased demand for the plaster it is understood that no less than four scows will be employed this summer."

Moncton Daily Times - Apr. 11, 1889 Plaster shipments. - The Albert Manufacturing Co., of Hillsboro, has resumed the shipment of plaster by water to Moncton and thence by rail to destination. Four scows will be engaged in the trade this

S. J. Daily Sun - Apr. 12, 1889 The Albert Manufacturing Co. of Hillsboro, has resumed the shipment of plaster by water to Moncton and thence by rail to destination. Four scows will be engaged in the trade this year."
Moncton Daily Transcript - Apr. 20, 1889 PLASTER SHIPMENTS.- The Albert M'fg. Co. brought to Moncton this week seven loads of plaster, 1600 bbls, in all. The breaking down of the company's mill, where the barrels are manufactures, caused a decreased output during the past week or so, but the mill is now running again."

Moncton Daily Times - Jul. 15, 1889 Albert Co. - Hillsboro, July 13. - ... The plaster quarries and mills here rank as one of the leading industries of the province. This industry, instead of receiving its death blow from confederation and the N.P., got an impetus upwards and is steadily increasing. The works are known as the Albert Manufacturing Co., and are owned by J.T. Tompkins, a Yankee by birth and push. In addition to the mill and quarries, he owns one of the finest farms in Albert Co. Of late years he is largely engaged in the lumber trade."

Moncton Daily Transcript - Jun. 6, 1889 Albert Co. News;- Last week the A. Mfg. Co. shipped over 1,900 tons of rock plaster to the United States."

Moncton Daily Times - Jun. 7, 1889 Last Week the A. Mfg. Co., shipped over 1900 tons of rock plaster to the United

Moncton Daily Transcript - Mar. 6, 1889 and Saint John Evening Gazette - Mar. 7, 1889 FIRST PLASTER SHIPMENT.- The Albert Manufacturing Company has in the vicinity of 1000 barrels of plaster in their warehouses on the wharves at Moncton. The first shipment of this year was made to-day, being a carload for J.S. Belcher, Halifax."

Daily Telegraph - Mar. 7, 1889 Moncton. - The Albert manufacturing company have about 1,000 barrels of plaster stored in their warehouses on the wharves here. Today they made a shipment of a carload to Halifax, being the first of the season."

Daily Telegraph - Nov. 7, 1889 Mr. James Blight of this place, who has been in Cape Breton the past summer operating a plaster quarry, is expected home in a few days. He will take back with him a number of men to help him in the quarry."

Codes: HILL / IDX_Names:Grey Brook Gypsum;
Chignecto Post - Oct. 24, 1889 Albert.- One day last week while a gang of men were at work in the plaster quarry for the Albert Manufacturing Co. at Hillsboro', a mass of stones and earth from above came tumbling down and two men were partly buried in the debris, one getting his foot badly damaged, and the other, John Pario, of Caraquet, getting a shoulder dislocated. Dr. Marven rendered the necessary surgical aid."

Chignecto Post - Jan. 2, 1890 The Albert plaster works have shut down for the season. They have now enough plaster on hand to supply all orders during the coming winter months."

S.J. Evening Gazette - May 23, 1890 Mr. Calvin Tompkins, president of the Albert Manufacturing Co., and father of Mr. J.T. Tompkins, manager of the company, died at New York a few days ago at the advanced age of 98 years. The funeral took place last Wednesday at New York, Mr. J.T. Tompkins being present."

Chignecto Post - Apr. 2, 1891 Considerable repairs and improvements have been made in the interior of the Albert M'f'g. Co's. plaster mills during the winter. The mill is expected to be running in full blast by the second week in April."

Moncton Daily Times - Dec. 1, 1891 Hillsboro. - On account of the great demand for plaster, the Albert Manufacturing Co.'s mill is running at night hoping to be able to fill all orders."

Moncton Daily Times - Feb. 28, 1891The Plaster Works Under the N.P. - Hillsboro, Feb. 29. - While the Transcript is stating that Tompkins of the Albert Manufacturing Company is in favor of unrestricted reciprocity. Councillor Taylor, an employee in that company has publicly declared that he endorses and supports the principles of the National Policy. Mr. Osman, the manager, said at Hillsboro, that the business under the N.P., had increased from 5000 to 23,000 barrels per annum. He has pledged his support to Dr. Weldon."

Moncton Daily Times - May 20, 1891 Albert Co. - Bliss Smith, a labourer in the plaster quarry at Hillsboro met with a painful accident on Thursday last. A large rock of plaster fell on him across the back. Drs. Lewis and Marven attended him."

Moncton Daily Times - May 21, 1891Hillsboro, May 19. - Bliss Smith who was seriously hurt at the Albert Manufacturing Co.'s plaster quarries last week, is on the mend."

S.J. Daily Sun - Apr. 1, 1892 Hopewell Hill. - Schooner Victory finished loading plaster here today and sailed this tide, with fair wind, for Red Beach."

Moncton Daily Times - Apr. 1, 1892 Albert Co. - Some of the coopers are at work, and the plaster mill will start as soon as the weather moderates, or about April 4."

Moncton Daily Times - Apr. 9, 1892 Albert Co. - The Albert Manufacturing Co. of Hillsboro, has commenced the hauling of plaster rock from quarry to wharf."

S.J. Daily Sun - Apr. 11, 1892 Albert Co. - The Albert Manufacturing company's mills have started operations again. Their works give employment to a large number of men and horses."

S.J. Daily Sun - Apr. 11, 1892 Albert Co. - Benjamin Fales, while working in the plaster quarries, had one of his ankles badly crushed by a rock falling upon it. Dr. Randall rendered the required aid."

S.J. Daily Sun - Apr. 12, 1892 Hopewell Hill. - ...The Victory is again loading with plaster at the wharf here for Red

Codes: HILL / IDX_Names:Grey Brook Gypsum;
S.J. Daily Sun - Apr. 14, 1892 Hopewell Hill, Ap. 12. - ...The Victory finished loading yesterday and joined the fleet in the

Fathom today. Heavy gales here from the westward for two days...."

S.J. Daily Sun - Aug. 24, 1892 Hopewell Hill. - The schr. Utility, Capt. Copp, sailed from Hillsboro on Friday, plaster laden."
Moncton Daily Times - Dec. 2, 1892 Albert Co. - James Blight is pushing the work at Demoiselle and piling plaster near the Wilson platform preparatory to shipping. Clarence Dimock, of Windsor, N.S., has been here a few days to note the progress of the work. - [Maple Leaf."

S.J. Daily Sun - Dec. 19, 1892 Hillsboro. - The Albert Manufacturing Company hope to run their works until the end of the year. The output of plaster is as large as ever and the teams continue to haul to the sheds and wharf."

Daily Times - Dec. 20, 1892 The Albert manufacturing company hope to run their works until the end of the year. The output of plaster is as large as ever and the teams continue to haul to the sheds and wharf."

Daily Times - Dec. 20, 1892 Schooner Gasper Embree, Wilson, arrived Saturday from Hillsboro with a load of plaster, shipped by the Albert Mfg. Co., to be stored in Harris' warehouse. The plaster is stored to be shipped from here during the winter on account of the possibility of the Albert railway shutting down. If the weather continues favorable the Gasper Embree will bring another load before navigation closes. Schooner Utility, Copp, sailed Saturday from Hillsboro, with a cargo of plaster to St. John, for shipment over the C.P.R."

Moncton Daily Times - Dec. 20, 1892 Albert Co. - The Albert Manufacturing company hope to run their works until the end of the year. The output of plaster is as large as ever and the teams continue to haul to the sheds and wharf. A vessel is expected here this week to load plaster for Messrs. Dimock & Co. She will receive her cargo at Gray's Island."

S.J. Daily Sun - Dec. 23, 1892 Hillsboro. - The H.R. Emmerson is unloading at the A.M. Co.'s wharf, and a three masted schooner is taking in plaster at Gray's Island."

Moncton Daily Times - Dec. 27, 1892 The schr. Wentworth is now loading at Hillsboro for New York with 600 tons rock plaster from the new quarry. The company is going ahead with the building of wharves and sidings for spring work. The proprietors are well satisfied with the quarry and no doubt have a valuable property."

S.J. Daily Sun - Feb. 17, 1892 Harvey. - An amateur class in sculpture is started in the advanced department of the school, and maybe said to be already successful. The material used is the anhydrate of gypsum or soft plaster rock. The rock has kindly been given to the school by Mr. Osman of the Hillsboro plaster works. This substance is easily sawn into blocks or slabs and can then be carved with an ordinary knife. The students have shown much interest in the work and have made much progress in a short time, both in carving designs on surfaces and in modelling vases, etc., from objects."

S.J. Daily Sun - Feb. 27, 1892 Albert Co. - (...Mild weather...) .... Plaster haulers (sleds) are unable to get all of the way to the wharf, which will necessitate the reloading of the plaster on wagons."

Moncton Daily Times - Jan. 8, 1892 Albert Co. - A steam drill is in course of construction at Surrey for immediate operation at the A.M. Company's quarry. The men are driving a new level by the floor of the present quarry."

S.J. Daily Sun - Jun. 2, 1892 Hopewell Hill. - May 31. - A large number of American vessels have been and are now loading plaster at the plaster wharf for the Albert Manufacturing Company."

S.J. Daily Sun - May 12, 1892 Hillsboro, May 10. - On Thursday, while at work in the mill of the Albert Manufacturing Co., Stephen Steeves got his hand badly jammed by a heavy stick falling upon it. Dr. Randall rendered the required assistance."

S.J. Daily Sun - Nov. 12, 1892 and Moncton Daily Times - Nov. 14, 1892 A Windsor, N.S., company have 18 men employed at the plaster quarry at Curryville, A. Co., and the prospects for a large output of the mineral are good."

Codes: HILL / IDX_Names: Grey Brook Gypsum;
S.J. Daily Sun - Nov. 28, 1892 Hopewell Hill, Nov. 22. - Schr. Utility is at Hillsboro loading plaster for the States."

S.J. Daily Sun - Oct. 13, 1892 Hopewell Hill, Oct. 11. - The schooners Utility and Luta Price are at Hillsboro loading plaster for Boston. On her last trip the Utility made the round voyage from Hillsboro to Boston, including loading and unloading, in

S.J. Daily Sun - Oct. 27, 1892 Hopewell Hill. - The three-masted schooner Harry W. Lewis sailed from Hillsboro yesterday with a load of plaster for New York."

S.J. Daily Sun, Page 3 - Wednesday, September 7, 1892 ALBERT COUNTY - Hopewell Hill - September 5 - Alarge American schooner is now due at Hillsboro, being chartered to carry a cargo of 4,500 barrels of plaster to Philadelphia."

S.J. Daily Sun - Sep. 12, 1892 Hopewell Hill, Sep. 8. - The schooner Luta Pricewent to Hillsboro yesterday to load barrel plaster for the States. Sep. 9. - The schooner Victory, Capt. Stiles, is at the Cape on her return from Boston...she will carry rock plaster from Hillsboro."

S.J. Daily Sun - Sep. 27, 1892 Hopewell Hill, Sept. 5.- The schooner Utility, Capt. Copp, is loaded at Hillsboro with 1,650 barrels of plaster for Boston. The American sch. Drisco is also loading plaster there for Newark, and the schr. Leonard D. left yesterday with a similar cargo for Rockland, Me. - The schr. Luta Price is undergoing repairs at Harvey Bank. She is having an additional breast hook put in and otherwise strengthened. - A large American schooner is now due at Hillsboro, being chartered to carry cargo of 4,500 barrels of plaster to Philadelphia."

S.J. Daily Sun - Aug. 7, 1893 Albert Co. - A gentleman from Hillsboro, Albert Co., who was in town Friday, told a Sun reporter that the Albert Manufacturing Co. of that place are doing a large business this year. They have charge of the lime quarries at that place and annually export to the United States about 200,000 tons of the rock in a crude state. This company also owns a large saw mill near there, and altogether they employ something over 100 men. A firm from Windsor, N.S., have recently opened a lime quarry a short distance from the one mentioned, but the quality of the plaster is much finer. They ship to the Newark Calcium Co. of that city. This is practically their first year, but they have already made good progress. They now give employment to about twenty-five men."

S.J. Daily Sun - Feb. 25, 1893 Hopewell Hill. - The plaster company here has received an order for 2000 tons of plaster, but it is not probable, with the present force of men on that they will be able to get that amount this winter."

S.J. Daily Sun - Jan. 6, 1893 Hillsboro. - The Albert Manufacturing company have closed down their works for the winter, and extensive repairs will be proceeded with at once. They have had a most successful year. The quality of plaster turned out maintains a high standard, and they are planning for a large output when spring opens."

Moncton Daily Times - Jun. 1, 1893 The Albert M'g. Co. is scowing plaster to Moncton for shipment on account of the bridge on the Salisbury and Harvey Railway being burned."

S.J. Daily Sun - Jun. 7, 1893 Hopewell Cape. - Four plaster laden three-masted schooners left the anchorage here today for American ports, the A.J. with stone for St. John....."

S.J. Daily Sun - Jun. 23, 1893 Hopewell Cape. - The Utility sailed from Hillsboro today with barrelled plaster for New York."
Moncton Daily Times - Jun. 30, 1893 The plaster quarry at Demoiselle Creek worked under the management of James Blight, is turning out a fine quality to moderately good quantities."

Codes: HILL / IDX_Names:Grey Brook Gypsum;
Daily Times - Mar. 2, 1893 Steeves family history, by W. O. Raymond. - ... In 1818 the Steeves brothers built three miles of tram road, for the purpose of hauling plaster. Probably this was the first three miles of railway built in the province. It was built simply by grading where the land was hard; where it was soft or marshy the track was built up with timber and covered with poles. The rails, which were made of wood, were fastened to the sleepers with wooden pins. The cars would carry from two to three tons; they were drawn by two or three oxen or horses. The plaster at that time was worth from three to four dollars a ton on the shore. About this time John McRay, the shipbuilder at the Cape, was doing a large business getting plaster at Lower Hillsboro. In 1823 the price of plaster went down to less than three dollars a ton, and the manufacturers came to the conclusion that it wouldn't pay so they abandoned the business. But now (1892) the plaster is worth from 80c. to $1 a ton, yet the business is carried on profitably. ..."

S.J. Daily Sun - Mar. 17, 1893 Albert Co. - Hillsboro, March 15. - ...... James Scott, engineer at the A.M. Co's, is able to return to work, though still lame from having run a nail into his foot. The Albert Manufacturing company sent away this week an elegant ash cabinet, two glass shades with rock plaster, in the natural state, two glass jars of plaster calcined, one raw plaster ground, two barrels of plaster calcined, and one of raw ground. There will be added to this a number of medallions, prepared in New York, to be distributed gratis at the World's Fair, Chicago, where the exhibit will be made."

S.J. Daily Sun - Mar. 17, 1893 Albert Co. - Hillsboro, March 14. - ... The A.M. Co. expect to start their mills on the 1st of April. The quarries are a sight worth seeing. Thousands of tons of plaster are being piled ready for the summer's shipping and grinding. Thirty-five horses and upwards of a hundred men are daily employed in this work. The men driving the tunnel with steam drill and dynamite have gone in over three thousand feet, are now sinking a shaft for ventilation. When this work is completed the plaster deposit known as Blight's quarry will be drained. It is now a lake, and not workable because of the water. This is considered the finest soft white plaster in the country. ... James Blight secured a few days since a handsome heavy span of horses for work at the Demoiselle quarry. They take three tons of plaster rock on a sled with

Moncton Daily Times - Mar. 24, 1893 Albert Co. - The Hillsboro plaster mills are to start upon April 1. The men in boring the tunnel in the direction of what is known as Bright's quarry struck a vein of water which lowered the lake four feet. They are also sinking a shaft from the surface almost three hundred feet from the mouth of the tunnel."

Moncton Daily Times - May 8, 1893 The Albert Manufacturing company are opening up the season's shipment, having already loaded some four or five vessels at Hillsboro. Their shipments are mostly made in American bottoms."

S.J. Daily Sun - May 22, 1893 Albert County. - ....Some inconvenience is experienced on account of the wharf being covered with plaster to such an extent that it is hardly possible to get on with deals. The plaster company will doubtless get their product off as soon as possible and give the millmen a chance."

S.J. Daily Sun - Nov. 9, 1893 Albert Co. - Hopewell Hill, Nov. 7. - The Albert Manufacturing Co. have made extensive improvements in their store, reflecting great credit on the good taste of Manager W.F. Taylor. The ceiling has been sheathed and painted pale blue, the shelves repainted and stocked with goods meeting the needs of the most fastidious."

Moncton Daily Times - Oct. 14, 1893 Demoiselle Creek. - Mr Blight keeps the usual number of men at work in the Dimock plaster quarry. This plaster is of a superior quality."

S.J. Daily Sun - Oct. 18, 1893 Hopewell Hill. - The schooner Victory will sail tonight for Red Beach, Me., with plaster from this port."

S.J. Daily Sun - Sep. 13, 1893 Hopewell Cape. - Schooner H.R. Emmerson, with barrelled plaster, from Hillsboro for St. John, sailed today."

S.J. Daily Sun - Apr. 13, 1894 James Scott, engineer in the Albert Manufacturing's plaster mill, today fell on a sharp spike, which penetrated the palm of his hand so that the spike protruded two inches."

S.J. Daily Sun - Aug. 21, 1894 Albert Co. - Hillsboro, Aug. 17. - ... Mr. Nickerson of Red Beach, Me., was in the village this week, in company with E.W. Lynds, on business in connection with the plaster quarries here."

S.J. Daily Sun - Aug. 21, 1894 Albert Co. - Hillsboro, Aug. 13. - ... Schooner Wentworth, Capt. Parker, from New York, arrived today at Grey's Island, to load plaster for the Wentworth Gypsum Company. The Hannah F. Carleton, Capt. Beal, is loading plaster at the Albert Manufacturing company's wharf."

Codes: HILL / IDX_Names: Grey Brook Gypsum;
S.J. Daily Sun - Aug. 25, 1894 Hillsboro. - Barkentine Harry Stewart is loading plaster at the Albert Manufacturing company's wharf."

S.J. Daily Sun - Jul. 3, 1894 Hopewell Hill. - A large four masted schooner passed up the bay yesterday to load plaster at Hillsboro. This is the first vessel of that rig ever seen in Shepody waters."

S.J. Daily Sun - Jul. 9, 1894 Hopewell Hill. - The sch. Victory is at the Fathom laden with barrel plaster for Boston from the Albert Mfg. Co., Hillsboro."

S.J. Daily Sun - Jun. 26, 1894 Albert Co. - Hopewell Cape, June 23. -Intelligence has been received that Charles Tarris of Demoiselle Creek, 40 years of age, received very serious and possibly fatal injuries this morning on the plaster tram railway at Hillsboro. While three loaded cars were descending a heavy grade, the horses being removed, the end of one of the cars broke and the plaster derailed the car, which was pitched off the track, burying Mr. Tarris, who had been attending the brake, beneath it, completely crushing one leg, injuring his back and causing, it is feared, internal injuries. The crushed limb will have to be amputated."

S.J. Daily Sun - Jun. 30, 1894 Hillsboro. - The three-masted schooner Gypsum Queen, Capt. Bentley, left Gray's Island wharf yesterday with 1,100 tons of plaster for New York."
Moncton Transcript - Mar. 30, 1894 Hillsboro. - The Waskino will load to-day, should the weather permit. She takes barrel of plaster from the Albert Manufacturing Co.'s wharf. She will be the first vessel loaded here this season."

S.J. Daily Sun - May 12, 1894 Hopewell Hill, May 10. - The plaster and lumber trade has reached larger proportions this season than ever before, and all the harbors at the head of the bay are filled with vessels… Hillsboro... The Cox and Green, recently cleared from that port, had capacity for a thousand tons of plaster."

Chignecto Post - May 17, 1894 The Albert county plaster and lumber trade has reached larger proportions this season than ever before, and all the harbors at the head of the bay are filled with vessels."

Moncton Daily Times - May 26, 1894 Hillsboro. - Mr. Dimock of Windsor, N.S. is here looking after his plaster quarry at Curryville. He has already shipped several cargoes this season from Gray's Island."

S.J. Daily Sun - Nov. 7, 1894 Hopewell Hill. - The schooner Victory, Stiles, arrived on Saturday from Boston, and will again load barrel plaster at Hillsboro for the same port."

Weekly Transcript - Oct. 8, 1894 Albert Co. - The Albert Manufacturing Co. is doing a rushing business at present. Owing to very large shipments, for a few months past, the stock of plaster is exhausted. The mill will run night and day this week, in order to supply three vessels, that are now waiting, with cargoes."

S.J. Daily Sun - Oct. 10, 1894 Hopewell Hill. - The schr. Victory, Capt. Stiles, arrived from Boston yesterday and will load barrel plaster again at the Albert Mfg. Co.'s Hillsboro, for Boston."

Moncton Transcript - Oct. 20, 1894 D. Holland & Co. have secured the contract of roofing with Sparham the buildings of the Hillsboro Plaster Manufacturing Co. The work will be commenced next week. Mr. Holland has several gangs of men engaged in different parts of the provinces."

Codes: HILL / IDX_Names: Grey Brook Gypsum;
Moncton Transcript - Oct. 26, 1894 and Daily Times - Oct. 27, 1894 A Substitute for Marble. - A Factory to be Erected at Hillsboro, Albert Co., Soon. - Ottawa, Oct. 26. - Mr. A.J. Madden, general manager of the United Marble Manufacturing Company of Chicago, is here with the object of taking out letters of incorporation to organize a Canadian company. They intend to erect factories at Hamilton, Ont., and in Albert county, New Brunswick. Their raw product is gypsum, of which there are rich deposits in the places named. This is hardened and polished when it becomes in appearance exactly like Italian marble. It is hard as a rock when finished but it can first be shaped with a plane just like a piece of wood. Mr. Madden says it will be cheaper than wood. A sample he carries was described by an expert as a piece of Italian marble, worth three dollars and a half a running foot. It is gypsum finished by the new process and costs only eight cents a foot. It will be cheaper to finish a kitchen with this beautiful marble than with wood, so that when the product is put on the market it will likely revolutionize the building trade. Mr. Madden took out a Canadian patent on it today. It will add great value to the gypsum deposits in Canada. There is a factory in Chicago and one in Grand Rapids, Mich., but the product has not yet been put on the market."

S.J. Daily Sun - Sep. 6, 1894 Hillsboro.- ... Schooner Nina Tillson, Capt.Green, is loading plaster at the Albert Manufacturing Co.'s wharf for Baltimore."

Moncton Daily Times - Sep. 11, 1894 The Wentworth Gypsum Company, who own a quarry at Demoiselle Creek, managed by James Blight, of Hillsboro, intend putting up a mill for the purpose of manufacturing the gypsum. At the present time they ship all their plaster in rock."

S.J. Daily Sun - Sep. 15, 1894 Hopewell Hill. - ... Schooner T.A. Stuart, Capt. Faulkingham, form Jamesport, and schooner Victory, Capt. Stiles, from Boston are loading plaster at the Albert Manufacturing Co.'s wharf. Schooner Wentworth, Capt. Parker, is loading plaster at Grey's Island for the Wentworth Plaster company."

Moncton Daily Times - Sep. 19, 1894 Hillsboro.- Schr. Wentworth, Parkes, is loading plaster at Gray's Island for Newark."

S.J. Daily Sun - Sep. 19, 1894 Albert Co. - Hopewell Hill, Sept. 17. - The schooner Victory, Stiles, sailed yesterday with barrel plaster from the Albert Mfg. Co. for Boston."

S.J. Daily Sun - Sep. 21, 1894 Hillsboro, Sept. 19. - The plaster mill of the Albert Mfg. Co. has been shut down for over a week on account of the scarcity of water."

Moncton Daily Times - Apr. 1, 1895 Rock Wall Plaster. - The Albert Manufacturing Co. of Hillsboro, A. Co., of which C.J. Osman is the manager, have placed a new product on the market:- rock wall plaster, which is claimed to be far superior in every respect to the ordinary plaster. It forms a wall durable, tough and practically indestructible. Among other things mentioned in its favor are the following: Rock plaster will not of itself crack, swell or shrink and will not come down in case of leakage. Rock plaster saves time, admits of carpenters immediately following the plasterers, giving the owner his building weeks earlier than with ordinary plaster. Rock plaster affords the finest and most durable surface for decorating and papering. Rock plaster is fireproof and is recognized by boards of underwriters as a remarkable fire retarder. Rock plaster can be used in winter as well as in summer, as it is only necessary to keep it from freezing till after it thoroughly sets, after which it is not affected by frost. Rock plaster will give you walls that are so dense as not to harbor vermin, filth or disease germs, and will make your house warmer in winter and cooler in summer. Rock plaster is put up conveniently for handling, is ready for use at an hour's notice and does not require days to get ready for plastering. Rock plaster gives a house that is healthy to occupy at once. Rock plaster does not stain in contact with iron, it adheres firmly to iron, wood or brick. Sumner Co. are the agents in Moncton for this very desirable article."

Moncton Daily Times - Apr. 2, 1895 Plaster Quarrying. - The Albert Manufacturing Company are preparing for the moving of their plaster on a lively and extensive scale. The mill began work Thursday. Most of the men from the quarry are at work on the road clearing the snow from the track and ice from about the wharf. Captain Christopher from the Cape brought his vessel up river Thursday. She will load at Gray's Island with lumber for the American market. Several vessels are expected in a day or so to load plaster. - Record"

Moncton Daily Times - Apr. 6, 1895 Pressure of business is compelling the Albert M'f'g Co. to shovel the snow from the rails of the tramway leading from the quarry to wharf, a distance of about three miles. There is more demand than usual this season, and as a result they cannot wait for the snow to melt."

Progress - Feb. 2, 1895 The Albert Maple Leaf says: Many of our men areworking at hoop-poles for next summer at the Albert Mfg. Company's plaster mills. Some have gone away to other places to prepare the hoops, others have the material brought here by the cars and make them at home. The company is deserving of praise in providing so much work for the men in winter - if not for this many would be out of employment for the winter. As it is now all have constant work."

Codes: HILL / IDX_Names:Grey Brook Gypsum;
S.J. Daily Sun - Feb. 6, 1895 The plaster quarry at Edgett's Landing is being operated by King and Howell."

Progress - Feb. 16, 1895 The plaster quarry at Edgett's Landing is being worked this winter, by King and Howell."

S.J. Daily Sun - Jul. 15, 1895 Hopewell Hill. - The schooner Harry W. Lewis arrived at the Plaster wharf, Hillsboro, yesterday, took in a cargo of 600 tons of rock plaster, and sailed today for Newark. This is quick dispatch. The three-masted topsail schooner Bahama is loading plaster at Hillsboro, and ten other schooners are now due at that port. An enormous amount of plaster in rock and barrels is being shipped from Hillsboro this season."

S.J. Daily Sun - Jul. 20, 1895 Hopewell Cape. - The three masted topsail schooner Bahama sailed yesterday from Hillsboro with plaster for New Haven, Conn."

S.J. Daily Sun - Oct. 12, 1895 Hopewell Hill. - The Nova Scotia three master Harry sailed yesterday with a cargo of plaster from Hillsboro. The three master John Stroupe arrived at Hillsboro yesterday to load plaster."

S.J. Daily Sun - Sep. 27, 1895 Exhibition. - The Albert Manufacturing Co. of Hillsboro is making a comprehensive exhibition of plaster and cements."

S.J. Daily Sun - Apr. 15, 1896 Hopewell Cape. - The H.R. Emmerson will go up to Hillsboro tomorrow to load barrelled plaster for Boston."

St. Andrews Beacon - Aug. 6, 1896 Schr. Warner Moore, from Hillsboro for Alexandria, Va., with rock plaster, went ashore Monday night at Split Rock, Musquash. She afterwards came off and was taken to St. John."

Moncton Daily Times - Dec. 16, 1896 Hillsboro. - The Albert Mfg. Co.'s plaster mill is still running full time. The output of plaster from the quarries has not lessened and the exportation, by shipping, is as active as in mid-summer."

S.J. Daily Sun - Jan. 8, 1896 Hopewell Hill. - The three-master Harry W. Lewis sailed yesterday from Hillsboro with a cargo of plaster for Newark."

S.J. Daily Sun - Jan. 15, 1896 1895 Exports from Hillsboro. - The Albert Manufacturing Co. loaded over 100 vessels. The shipments of rock plaster amounted to 56,117 tons, as compared with 37,400 tons in 1894, and the total value of rock and calcined plaster shipped by this company to the United States was $85,930 as compared with $57,937 in the previous

Daily Sun - May 9, 1896 Hopewell Hill, May 7. - While Benj. Fales of Chemical Road was working in the quarry at the Albert Mfg. Co. at Hillsboro, his head and shoulders were so badly injured that it was feared at one time that he was killed outright. This morning he was reported somewhat easier. Mr. Fales is an expert miner and very industrious man. This is the third accident that has occurred at this quarry this week."

S.J. Daily Sun - Oct. 27, 1896 Hopewell Hill. - The schooner Utility, Capt. Copp, has arrived at Hillsboro, and is loading barrel plaster for New York."

Codes: HILL / IDX_Names:Grey Brook Gypsum;
Gazette - Jan. 26, 1897 Tariff Enquiry. - ... C.J. Osman, M.P.P., made a statement in behalf of the Albert Manufacturing

company, setting out the reduction in the duty on plaster from 45 to 40 cents, made at the last revision of the tariff, necessitated a corresponding reduction in price to points in most parts in western Canada. Further reduction would make the business unprofitable. They would cheerfully welcome reciprocity in this article and submitted that if any changes be made in the direction of increase rather than decrease in the present rate. To Sir Richard - Our present sales in Canada are over 23,000 barrels. We shipped 60,000 tons of plaster rock to the United States last year. Each ton of plaster rock makes about eight barrels of plaster."

Daily Sun - Jan. 26, 1897 Tariff Enquiry. - ...C.J. Osman, M.P.P., read the following statement in behalf of this company. In the matter of a change of duty upon plaster of paris, should any be proposed, we beg respectfully to submit the following points for your consideration. That the average price at mill, now obtainable for sales throughout Canada, is 86 cents per barrel of 300 pounds, from which has to be deducted back charges and interest where credit is given. Calcined plaster cannot be manufactured for less than 80 cents per barrel unless in far larger quantities than the present demand of the Canadian market represents. It is quite impossible to increase the present price owing to competition from the manufacturers of plaster in the states of Michigan and Ohio. A reduction in the duty on plaster from 45 to 40 cents, made at the last revision of the tariff, necessitated a corresponding reduction in price to points in most parts in western Canada. Further reduction would make the business unprofitable. The average cost to the consumer at this time is at least 35 cents per barrel less than before the imposition of protective duties, and the price obtainable is at least 25 cents per barrel less for the manufacturer. We would cheerfully welcome reciprocity in this article, and in conclusion submit that if any change be made it should be in the direction of increase rather than decrease in the present rate, no satisfactory reason having yet been given for the reduction above referred to. The manufacture of this article is important in the locality in which it is made, i.e., in the parish of Hillsborough, county of Albert, N.B. It also affords considerable freight for the Intercolonial railway, total shipments over this road for the year 1896 amounting to 23,144 barrels, and if not discouraged would in time become a very important contributor in the way of freight to this railway. To Hon. Mr. Fielding - The present protection is 50 per cent. Sir Richard Cartwright - I see it is pretty nearly total production, as very little of this article is imported into Canada. To Hon. Mr. Fielding - The price in the United States is the same for export as home production. Our average price at the mill is the same, 85 or 86 cents. The duty simply permits us to ship to points in Upper Canada in competition with the cheaper freights from the United States. Anything less than the present duty would make our business unprofitable. To Hon. Mr. Blair - I would welcome reciprocity and would give up the Canadian market cheerfully for Boston alone. To Hon. Mr. Paterson - We ship in barrels. To Sir Richard - Our present sales in Canada are over 23,000 barrels. We shipped 60,000 tons of plaster rock to the United States last year. Each ton of plaster rock makes about eight barrels of plaster. To Col. Domville - The rock is reduced in the United States instead of here. To Sir Richard - It goes into the United States free. There is now talk of a duty being put on. His remarks referred to calcined plaster, etc. They shipped very little ground plaster for agricultural purposes."

S.J. Daily Sun - Jul. 14, 1897 Hopewell Hill. - The three master J.W. Durant of Parrsboro, N.S., is loading plaster at the Hill wharf."

S.J. Daily Sun - Jun. 11, 1897 Hopewell Hill. - The schr. Victory is loading plaster at the Hill wharf for Red Beach, Me."

St. Croix Courier - Sep. 23, 1897 A Toronto firm has secured the patent right in Canada for a process which renders gypsum as valuable for monumental and building purposes as is marble. If this process possesses all the virtues which its promoters claim for it, there will soon be a great reduction in the price of marble, or its use will be displaced by gypsum. Such a change would be of immense benefit to this province, as it would open up a new industry in the gypsum quarries of Albert and the mountains of gypsum in Victoria county. Samples from these deposits have been submitted to tests, with

S.J. Globe - Aug. 6, 1898 Married at Hillsboro. - Mr. Fred Thompson, formerly of Carleton, now in the employ of the Albert Manufacturing Co. ..."

Moncton Daily Times - Jul. 13, 1898 Albert Co. - Hillsboro, July 11. - ... the Albert Manufacturing Co., which employs such a large proportion of the population. Were the gypsum industry to go down Hillsboro would soon become exceedingly dull and large numbers would have to leave the place. But we are thankful to say that the prospects are pretty bright and we hope that Hillsboro will become more and more important as time goes on."

S.J. Globe - Jul. 26, 1898 The plaster works at Hillsboro are again closed down on account of the dullness in the American market."

N.B. Reporter - Jul. 27, 1898 The Albert Manufacturing Company's plaster works at Hillsboro closed down Saturday night for five or six weeks for repairs."

Daily Courier - May 2, 1898 and N.B. Reporter - May 4, 1898 and St. Croix Courier - May 5, 1898 Seventy-five men have been laid off at the Hillsboro plaster works as a result of the war."

Moncton Daily Times - May 18, 1898 Albert Co. - Hillsboro. - The shipping of plaster and lumber from this port are only minor factors this summer as compared to other seasons."

Moncton Daily Times - Nov. 14, 1898 The steamer John H. Hill has loaded with plaster and gone. Her coming has given entire satisfaction to the shippers and more steamers may be expected next season."

Moncton Daily Times - Nov. 14, 1898 On Thursday, while loading plaster cars for the Albert Manufacturing Co., Talbot Steeves met with a most painful accident. His foot got caught between the platform and car while the loaded car was in motion. The bones of the leg near the ankle, were broken and the ankle joint torn open. Mr. Steeves was taken to his boarding house at Albert Mines and is attended by Dr. Marven."

S.J. Globe - Nov. 16, 1898 Thursday, while loading plaster cars for the Albert Manufacturing Company, Albert Steeves, of Hillsboro, met with a most painful accident. His foot got caught between the platform and the car and the bones were broken and the ankle joint torn open."

Daily Sun - Nov. 17, 1898 A young man named Steeves of Baltimore had his foot badly crushed between a plaster car and railway platform at Curryville a few days ago."

S.J. Daily Sun - Nov. 19, 1898 Hillsboro. - A large amount of plaster has been shipped by the Albert Manufacturing Co. during the last four weeks."

N.B. Reporter - Dec. 20, 1899 Thomas Reid, a native of Newfoundland, was struck by a plaster car at the Hillsboro quarries Monday and had the toes and part of one foot jammed off."

S.J. Daily Sun - Jul. 19, 1899 Hopewell Hill. - A large steamer is loading plaster at Hillsboro for the Albert Mfg. Co. The schr. Lombard, Copp, arrived in the river Saturday night with freight from St. John."

Daily Sun - Sep. 14, 1899 Exhibition. - Albert Manufacturing Co. - this enterprising industry makes a well arranged and comprehensive exhibit of the product of the famous quarries and mills at Hillsboro, N.B. They show crude rock and manufactured plaster, including the finest calcined for dentists use. Their exports to the U.S. this year will reach 100,000 tons, as against 10,000 tons a few years ago. Their main exhibit is on the western side of the passage from the main building to the annex but just to the left outside of the door leading from the main building to the grounds they show a section of an interior house wall lathed and plastered with their rock wall plaster, which should be seen by every builder and every man who has a house to erect or repair. The great superiority of this over common plaster is in the hurry- up. It is all ready for immediate use. Applied today, carpenters can go on with their finishing tomorrow. Paper hangers are not delayed by its use, as with ordinary wall plaster. It will not crack when dry, and in the case of fire breaking out in a building the water poured on will not damage the walls. It has been used in the I.C.R. buildings and Aberdeen school at Moncton with the utmost satisfaction. The chief Canadian demand comes from Toronto, where the best builders will have nothing else. Rock wall plaster has come to stay. Vroom & Arnold are St. John agents for the Albert Manufacturing Co."

S.J. Daily Sun - Jun. 25, 1900 Schs. Roger Drury and Bessie Parker load plaster at Hillsboro for New York."

S.J. Daily Sun - Mar. 23, 1900 Sch. Gypsum Queen, at St. Andrews, is chartered to load plaster at Hillsboro. Arrangements are being made to have the vessel towed to Hillsboro."

Codes: HILL / IDX_Names: Grey Brook Gypsum;
Daily Sun - Oct. 2, 1900 That Hillsboro Fatality. - A coroner's inquest was held before Coroner Marven at Hillsboro on the bodies of the two men killed on Friday morning in the plaster quarry. The evidence went to show that the two men were working with a foreman at the spot where the accident occurred when a huge body of rock fell upon them. The foreman had a narrow escape, being only two or three feet away. The jury brought in a verdict to the effect that the accident was due to the carelessness of the men themselves, and that the officials of the company were not to blame. Some men who have been employed at the quarry have left the works on account of recent accidents, and several of them took their departure from Hillsboro on Saturday. - Times."

N.B. Reporter - Oct. 3, 1900 Another cave-in occurred in the quarry of the Plaster Co., at Hillsboro Friday morning. Two men were buried under the rocks. One was a native of Newfoundland and the other a Frenchman. Men are now at work removing the debris."

Richibucto Review - Oct. 4, 1900 The names of the two men killed at the Plaster Quarries at Hillsboro on Friday morning are Roger Allen, of Buctouche, who had only been employed at the works one week, and Augustus Sparks, of Newfoundland. Their bodies when removed from the mass of plaster which crushed them were found to be frightfully

Daily Sun - Oct. 10, 1900 Fatal Accident in the Plaster Quarries. - Hillsboro, Albert Co., Oct. 9 - As a result of the accident at the plaster quarries, in which two men were killed, all the Frenchmen have thrown up their jobs and gone to their respective homes. The Newfoundlanders have also been leaving in large numbers. Eight took the train on Monday morning and others expect to take their departure at a later date. The quarry where the accident occurred has not yet been reopened, consequently the usual amount of plaster has not been mined or shipped."

Daily Sun - Oct. 23, 1900 Yesterday at the quarries of the Albert Manufacturing Co., Andrew Stevenson, who was employed in blasting, drilled two holes near together and filled them with powder. He then lighted the fuses and left the tunnel. The blasts failed to explode at the time he expected, so he went back to investigate. Just as he reached the spot one explosion took place, and plaster was thrown in all directions around him, a quantity of it striking him and inflicting ugly wounds. Fortunately the injuries did not prove to be serious, and the man will recover in a few weeks. This is only one of a chapter of accidents at the quarries this year, three of which were fatal. In fairness to the company, however, it must be said that the majority of the accidents are due to carelessness of the men who are employed at the mines. Most of the employees have returned to work in the tunnels."

S.J. Daily Sun - Sep. 4, 1900 Hopewell Hill. - Sep. 1. - Doctors hold out no hope for the recovery of Geo. Jones of Hillsboro, who was injured at the quarries last week. It has been learned that the unfortunate man's eyes were not destroyed as was at first supposed."

Daily Sun - Sep. 6, 1900 Hillsboro, N.B., Sept. 5 - George Jones, who was struck by a falling rock a few days ago at the plaster quarries of the Albert Manufacturing Co., died on Sunday. He never regained consciousness after the accident occurred. The funeral service, held yesterday, was conducted by the Rev. S. James. The large concourse of people testified to the esteem in which the unfortunate man was held. He leaves a wife and two children. Last evening an inquest was held by Dr. Marven to determine the cause of the accident. After hearing the evidence and deliberating for some time, the jury brought in a verdict that the deceased came to his death by being struck by a rock falling from an unsafe place."

S.J. Daily Sun - Sep. 29, 1900 Hopewell Hill, Sep. 28. - The plaster barge fleet arrived at Hillsboro this week."

Daily Sun - Sep. 29, 1900 Accident Near Hillsboro. - Two Men Killed in the Quarry by a Fall of Plaster Rock. - (Special to the Sun). - Hillsboro, Albert Co., Sept. 28. - By a terrible accident which occurred this morning in one of the Albert Manufacturing Co.'s plaster quarries, near here, two unfortunate quarrymen were instantly killed, being buried under masses of plaster rock weighing over ten tons. The victims of the accident were a workman named Sparks, whose home is in Newfoundland, and a Frenchman, Rogers, who came here from Richibucto. It is understood that none of the other workmen were near the spot at the time of the accident, and but for this many more lives might have been sacrificed. Rogers and Sparks were at work tunnelling out plaster at the time, when an immense mass of rock above them cracked and separated from the roof of the tunnel and came down upon them before they had time to get out of the way. Some of the other quarrymen, alarmed by the noise of the falling rock, ran to the scene, but were too late to be of any service save to excavate the bodies from beneath the debris. The affair has cast a deep gloom over the entire community, as both the deceased men were well known here and had many friends."

S.J. Daily Sun - Dec. 11, 1901 Hopewell Hill, Dec. 8. - The new Parrsboro schooner M.J. Taylor is loading plaster at Edgett's Landing for the King Company, of which J.L. Peck is local manager. This is the Taylor's first cargo."

S.J. Daily Sun - May 15, 1901 The usual line of spring accidents has begun in the plaster quarries of the Albert Manufacturing Co. at Hillsboro. Report says that Harry Steeves was badly injured the other day by two large pieces of plaster falling on him, breaking his ankle and shoulder and cutting his face badly, besides injuring him internally."

S.J. Daily Sun - May 21, 1901 Hopewell Hill, May 19. - The Jeffrey is loading plaster at Hillsboro."

S.J. Daily Sun - Nov. 4, 1901 Hopewell Hill, Nov. 1. - ... the new three- master Ethyl B. Sumner, with plaster from Hillsboro (is) at the island awaiting a fair wind down the bay ... bound for New York. Benjamin Fales had one of his legs badly hurt today while working in the plaster quarry at Hillsboro, and will be laid up for some time."

S.J. Daily Sun - Nov. 13, 1901 The Dimock plaster quarry at Demoiselle Creek, has been closed for the winter and Manager Smiley has returned to Windsor, N.S."

S.J. Daily Sun - Nov. 20, 1901 New Quarry at Hillsboro. - The Messrs. King of New York have about a dozen men at work developing their plaster quarry at Hillsboro, Albert Co. They have held this property for a number of years, but for various reasons have not heretofore done much development work. The quarry is only about a mile from the river, and if the property turns out right it is expected a large business will result. The Messrs. King own plaster mills in New York, which will be supplied direct from the quarry. - Moncton Times."

S.J. Daily Sun - Apr. 18, 1902 Hopewell Hill (16th). - A considerable number of plaster schooners are awaiting berths at Hillsboro. A steamer arrived yesterday to load plaster."

Daily Sun - Feb. 12, 1902 Hopewell Hill, Feb. 10. - Chipman Smith, who was seriously injured last week by being struck with a piece of falling plaster, is lying in a critical condition, with symptoms of brain fever."

Daily Sun - Feb. 5, 1902 It is reported that Chipman Smith, an employee of the Albert Manufacturing co. of Hillsboro, Albert Co., was seriously injured one day last week by a large piece of plaster falling upon his head. He lies in a precarious

Weekly Record - Fri., Feb. 14, 1902 Chipman Smith, of Demoiselle Creek, Albt. Co. narrowly escaped fatal injury last week while working at the Albert Manufacturing Company's quarry. A piece of plaster, falling 20 feet, struck the man a glancing blow on the head, rendering him unconscious for nearly 24 hours. Dr. Marvin, of Hillsboro, attended the case."

Weekly Record - Fri., Feb. 14, 1902 The plaster industry is booming at Hillsboro. In addition to the operations of the Albert Mfg. Co., the B.C. and C.V. King Co., who operate large mills in New York, are developing their quarry at lower Hillsboro. This property has not been worked for many years, but is now being operated on quite an extensive scale. Should the stock which is being quarried this winter come up to the expectations of the company, they will do an immense business in the future, employing from 100 to 200 men. The community is hoping for the success of this industry, as it will be of great benefit to the people. Mr. John L. Peck is the local manager of the Company."

S.J. Daily Sun - May 2, 1902 Hopewell Hill (apr. 30th). - Alden H. Peck has shipped as first officer in the large three-master Ruth Robinson, now loading plaster at Hillsboro for New York."

N.B. Reporter - Sep. 17, 1902 At Hillsboro, Monday afternoon Charles Pindell and Frank Steeves, employed by the Albert Manufacturing Company at the plaster quarry, were caught by a cave-in and crushed to death. Pindell was killed almost instantly. His companion lived about two hours. Both were young men. Pindell was an Englishman. Steeves was a son of Nelson Steeves, of Hillsboro, and was married."

Codes: HILL / IDX_Names:Grey Brook Gypsum;
Weekly Record - Fri., Apr. 24, 1903 The Albert Manufacturing Company is shipping a large amount of plaster rock at present, and their business seems to be very rushing in all departments."

Albert County Journal, Page 3 - Friday, July 3, 1903 LOCAL & GENERAL NEWS - A quarryman in attempting to board the Albert Manufacturing Company's plaster train, while in motion, missed his footing, and was thrown forcibly to the ground, and although sustaining a shaking up and a few bruises, escaped serious injury. Jumping on this train while in motion is strictly forbidden by the Company."

Weekly Record - Fri., Nov. 20, 1903 The Albert Manufacturing Co. has been making considerable improvements at their works in Hillsboro. Mr. Edward Dunham returned yesterday from Hillsboro, where he has been engaged at masonry at the plaster works for the past three months and a half. Two new boilers, made by J. Weir & Sons, of Moncton, have been put in and a new brick vault has been built in the company's store. The work of bricking in the boilers and all the mason work was done by Mr. Dunham, who goes to Shulee, N.S., next week to do some similar work at the mill owned by Mr. C.W.
Albert County Journal, Page 3 - Friday, October 16, 1903 WAY UP - The Albert Manufacturing Company have had two new boilers put in their plaster mill here, also an iron roof on the boiler shed. The boilers are some 24 feet long. A new smoke stack standing 95 feet from the ground, was placed in position last week, and is one of the highest in the Maritime Provinces. Mr. John P. Weir, of Moncton is doing the work."

Albert County Journal, Page 2 - Friday, September 18, 1903 NOTICE TEN DOLLARS REWARD Whereas on Sunday afternoon last, some person or persons, presumably with felonious intent did placeacross the rails of the Railway track leading to the Quarries of the Albert Manufacturing Company on the approach to the Taylor Mill Bridge a stick of wood or timber, which if not discovered and removed would in all probably have caused serious damage to property, and great risk to the men employed upon the trains running to the Quarry. Any person giving such information, as will lead to the apprehension and punishment of the person or persons guilty of this offence will be paid the sum of Ten Dollars. ALBERT MANUFACTURING COMPANY C. J. OSMAN, Manager. Hillsboro, August 12, 1903."

Daily Sun - Jul. 9, 1904 Hillsboro History. - ... After the farm and forest products come the products of the Hillsboro gypsum quarries. Much has been written about those of the Albert Manufacturing Company, which furnishes work for 300 employees and fifty horses during the greater part of the year. The gypsum is a lower Carboniferous deposit, a formation rich in minerals in the province, and is obtained at the present time by tunnelling in the quarries three and a half miles from the river. During 1903 this company shipped 110,000 tons of the crude and manufactured gypsum. For many years the rock was hauled by means of horse power in small cars to the mill with three tons in each. About three years ago a small train(?) was substituted, which makes six daily trips with its thirty or more cars, bringing out about 600 tons per day. Gypsum quarrying is also carried on in other parts of the parish, but on a smaller scale. ..."

Weekly Record - Fri., Jun. 3, 1904 Hopewell Hill. - The Boston Schooner 'Ruth Robinson' has arrived in Hillsborough for a load of plaster."

Kings County Record - Sep. 15, 1905 A serious explosion at the Blight plaster quarry at Albert Mines, on Sunday last when three young men set fire to a fuse igniting a box of powder in the powder shed which resulted in completely wrecking the building and hurling the men some feet distant, and burning them severely about the breasts and arms. They are suffering intensely from their wounds, and will doubtless remember their exploit for some time to come."

Semi-Weekly Sun - Mar. 14, 1906 Killed in Hillsboro Plaster Quarries. - Richard Milton Crushed to Death Yesterday by a

Cave-In. - Moncton, N.B., March 9. - Two accidental deaths have occurred in Albert county within the past week. .... yesterday in the Osman plaster quarries at Hillsboro Richard Milton was crushed to death by a cave-in in a tunnel in which he worked. A large quantity of plaster fell on him and his head was crushed, his leg broken and other terrible injuries sustained. Other workmen were nearby, but were not injured."

Kings County Record - Mar. 16, 1906 By the fall of a quantity of plaster in the Osman quarries at Hillsboro Thursday of last week, Richard Milton, an employee, was crushed to death....."

Kings County Record - May 11, 1906 Alma. - Mr. Steeves, Mgr. for the Albert Manufacturing Co., at their plaster quarry, Martin Head, was in the village this week on his way to the quarry."

Semi-Weekly Sun - May 26, 1906 Hopewell Hill, May 22. - There is more than the ordinary activity at the Hillsboro plaster wharves and quarries at the present time, and the plaster, both rock and in barrels, is being shipped at a rapid rate, some of the crews working until midnight. Two steamers were recently loading at the berths and two more in the stream awaiting their turn. A big four-master has just sailed and there is a constant run of three-masted craft, which keep the loading crews on the jump. There have been lately eight plaster trains a day carrying cargoes to the wharves, each train being made up of twenty to twenty four cars, with two or three tons each. The New England Adamant Company here shipped their first cargo this spring on Friday, the three master Hartney W. sailing with 600 tons for Boston. This schooner will return for

North Shore Leader - Mar. 20, 1908 Albert Mfg. Co., to Close Down. - On account of the oppression now prevailing throughout the country the Albert Manufacturing Company at Hillsboro, A.Co., will close down work in their plant and quarries for at least two months. The Albert Manufacturing Company is owned by United States capitalists and is under the management of Hon. C.J. Osman. Some two hundred men are affected by the close down."

Granite Town Greetings - Mar. 25, 1908 The plaster quarries of the Albert Manufacturing Company, Hillsboro, have closed down for two months, due to the dullness of the American markets."

Campbellton Graphic - Dec. 23, 1910 Another Tragedy At Hillsboro Mines. - Three Men Killed By A Sudden Fall Of Rock And One Injured. - Hillsboro, A.C., Dec. 16. - Three lives were instantly snuffed out about three o'clock this afternoon beneath a fall of several hundred tons of plaster rock at the Albert Manufacturing Co. quarries, and a gloom has been cast over the town in consequence of the disaster, which is probably the worst in the history of the works. The catastrophe occurred about the middle of this afternoon and the victims were: Fred Nelson, age about 38 years. Edward Collette, age about 45. Theophilus Allain, age about 21. Octave Duplissy, was injured, having a hairbreadth escape from death. A hidden crack in a high embankment of plaster rock was the cause of the terrible accident. A crew of men, under foreman James Livingstone, were working at the fatal spot, two drilling into the face of the high cliff and three being engaged at the base loading plaster into a cart. Fred Nelson and Ernest Allain were about half way up the side of the embankment drilling for a blast, which was intended to dislodge the overhanging wall of rock. Suddenly and without a moment's warning the mountain of rock fell, carrying with it Nelson and crushing him to death, also two of the men at work below. Foreman Livingstone was on the side of the embankment with Nelson and Allain and miraculously escaped by stepping to one side as the rock fell. Fred Allain also escaped death by jumping out of harm's way. Theophilus Allain and Edward Collette were buried beneath the side but Octave Duplissy escaped being killed, but was pinned down under a rock that cut off his foot and held him fast until pried out by his fellow workmen. Fred Nelson, who belonged to Albert Mines, leaves a wife and six children, who live near Buctouche. The youngest child is only about four months old. Theophilus Allain, who is said to be about 21 years of age, was unmarried. He was a cousin of Ernest Allain, who was drilling with poor Nelson and had such a providential escape. He also belonged to Kent county, where his relatives reside. Octave Duplissy whose injuries are reported not to be serious, is about 40 years of age and his home is in Kent."

Daily Telegraph - Oct. 17, 1910 Hon. C.J. Osman Honored By His Employees. - Tendered a Complimentary Banquet and Presented With Gold-headed Cane by 250 Albert Manufacturing Company Men. - Hillsboro, N.B., Oct. 13 - A complimentary banquet tendered Hon. C.J. Osman by employees in the Albert Mfg. Co., was held in the company's hall on Wednesday evening, Oct. 12. About 250 men were present and a most enjoyable time was spent. F.M. Thompson was chairman. During the evening Mr. Osman was presented with a gold-headed cane, and address, the presentation being made by G.P. Steeves on behalf of the employees. Mr. Osman was delightfully surprised, and replied thanking the men and assured then of the good will and friendship that existed between the employer and employees. There were a good many speeches made by the men present. ... The engraving on the cane was as follows: 'Presented to Hon. C.J. Osman by employees Albert Mfg. Co., Oct. 12, 1910.'"

Daily Telegraph - Sep. 30, 1910 Large Quantity of Gypsum Shipped From Hillsboro.- Mr. Osman Says Season Has Been Very Busy One - Here for a Few Days. - Hon. C.J. Osman, of Hillsboro, arrived in the city last evening on the Pacific express and registered at the Royal. He is on his way home after spending a few days in Cape Breton. To a Telegraph reporter last night he said that the shipments of gypsum and plaster from Albert county this year have been exceptionally large., 'It has been one of the best seasons we have had for some time,' he added. 'In all, we have shipped between 123,000 and 130,000 barrels.' Mr. Osman will likely remain in the city for a few days."

Codes: HILL / IDX_Names:Grey Brook Gypsum;
Albert Journal - Wednesday, March 22, 1911 A Very Heavy Loss - We are sure that we are only expressing the general feeling of the citizens of Albert County when we extend to The Albert Manufacturing Company, to Honourable Mr. Osman, its manager and to the others associated with him, our sincere sympathy in the very serious loss which they have recently sustained. To see more than one hundred thousand dollars go up in smoke within a few hours, to realize that property, which cost so much labour and money has been ruthlessly destroyed, it is most disheartening. People may talk about the manufacturer and complain because he does not pay high enough wages; they may grumble because this is not right and that is not right, but after all the manufacturer has troubles as well as the employees. In these days when competition in most lines is so keen, when conditions are changing and when money comes none too easily, the manufacturer has much to worry him. When the men tired with physical toil, are enjoying refreshing sleep, the officers of a manufacturing concern, may be burning the mid-night oil in their endeavour to solve the very knotty problem of business. For a time after the fire it was feared that the company would not rebuild, but we are very glad to state that the present expectation is that a mill bigger and better than the old one will be constructed as soon as possible. We feel sure that the people of Albert County and the people of Hillsboro in particular will rejoice at the good news and that the action of the company will be heartily appreciated."

Albert Journal - Wednesday, March 22, 1911 Plaster Mill Burned Thursday -The Loss Will Be About $150,000 - Partially Covered By Insurance - Over one hundred Hands Thrown Out Of Employment - The Company Expects To Rebuild - Hillsboro has again suffered a great loss by fire. In June last the Hillsboro Baptist church and parsonage were wiped out and now the large mill owned by the Albert Manufacturing Company Limited, is in ashes. Hillsboro is having tough luck and deserves the sympathy of the province. The Town's greatest industry has received a terrific blow and only those who live in Hillsboro and know what it means to our people can appreciate the great loss which The Albert Manufacturing Company, the employees, and the merchants and people of the town have sustained. There is one bright feature to the matter from the Town's standpoint, however, and that is the fact that the mill again be built. There are rumours that the mill would not be built in Hillsboro, that the town was going to lose its big industry, but we are thankful to state that the expectation now is that the mill will rise from its ashes; that it will be built of fire proof material; that it will be a larger and better mill than was the old one. If this report is true the town has every reason for thankfulness, for had the mill not been rebuilt over one hundred of our citizens would have been obliged to leave their homes and seek employment elsewhere and the town would have been depopulated. The mill had been closed down for repairs about six weeks and was to have been re-opened Thursday morning. Instead of the whistle calling the men to work, however the fearful cry of fire was raised. The blaze was discovered by Charles Steeves, the watchman. The fire originated in the saw mill some fifty feet away from the boiler and it is a mystery what started it. The building being of wood and very dry, the fire spread very rapidly and nothing could be done to stay the progress of the flames. Two short hours after the fire was discovered the building was a smouldering heap of ruins, of a tangled mass of scrap iron, which was only a short time previous up-to-date and expensive machinery. Truly the picture was heart-rendering and discouraging in the extreme to the people who stood round the dying embers of what was so recently an excellent manufacturing plant. In addition to the mill there was destroyed cars to the value of between four and five thousand dollars, forty cords of wood and a large quantity of material for making barrels. The loss is difficult to estimate, but will probably run up to about $150,000, partially covered by insurance. Honourable C. J. Osman, manager of The Albert Manufacturing Company, was in Upper Canada at the time of the fire. He was at once communicated with and he arrived home Saturday. It is only when we lose something that the full appreciation of its value is impressed upon us. While the importance of the gypsum industry to Hillsboro has always been felt in a way, yet when there was a prospect that the mill would not be rebuilt then it was that the full realization of its importance and the fact that the Company and its manager. Mr. Osman occupies a very large place in the life of Albert County was impressed strongly on the minds of the people. It is to be hoped that the work of rebuilding will be begun at an early date. This is the second time that the plaster mill has been destroyed by fire. The first time was some thirty years ago."

Albert Journal - Wednesday, March 29, 1911 Honourable C. J. Osman Expresses Thanks - The Loss Recently Sustained By The Albert Manufacturing Company, Was $113,000, With Only $25,000 Insurance - March 24, 1911 To the Editor of The Albert Journal, Dear Sir:- Will you permit us, through your columns, to extend to the residents of Hillsborough our heart-felt thanks for the generous assistance given us at the time of our recent, most disastrous fire. Nothing could have more fully illustrated the interest of this locality in our enterprise here, than the heroic efforts put forth by the people of Hillsborough to save as much of our property as possible, on that occasion. We also deeply appreciate the generous and help public sentiment which expressed itself in a meeting of the citizens called very shortly after the fire, at which a unanimous resolution was passed in favour of exempting The Albert Manufacturing Company from taxation for a term of twenty years, in the event of their deciding to rebuild the Plaster Mill. At such a time of depression as is created by a disaster such as we have passed through, such proffered aid and assistance is of great value, and very much more than helpful. As, in some quarters, the impression seems to be that our loss has been very slight, we desire, (with the approval and consent of the Insurance Adjusters), to state that our whole plant is entirely destroyed, and that the actual loss (placing the valuation of the property destroyed at a very conservative estimate) will reach a total sum of $100,000. For Mill Plant, and for Supplies, Manufactured Plaster, Mill Fittings, Tools, etc., etc., also destroyed, a further loss of $12,000. or $13,000. has been entailed. Against the whole of this loss, we have insurance to the extent of $25,000. We have no wish to make public appeal for sympathy. This statement is only made for the purpose of satisfying our kind and generous Albert County friends that the action taken by them is not unappreciated, and their offer of substantial aid not unwarranted. Yours respectfully, C. J. Osman, Manager."

Codes: HILL / IDX_Names: Grey Brook Gypsum;
Albert Journal - Wednesday, March 29, 1911 Will The Plaster Mill Be Rebuilt In Hillsboro? -Honourable C. J. Osman, manager of the Albert Manufacturing Company, left Tuesday for New York, where on Thursday he will attend a meeting of the directors of his company. The question to be considered of course, is one which is of vital interest to Hillsboro and Albert County, viz, 'Shall the plaster mill, recently destroyed by fire, be rebuilt at Hillsboro?' The arguments in favour of rebuilding centre around the Hillsboro gypsum, its quality and quantity. That the products of the Albert Manufacturing Company have gained an enviable reputation for quality in the markets of Canada and New Zealand is common knowledge, but that the quantity of the Gypsum in Albert County is all that we would like to see it is a matter open to debate, some stating that there are 'mountains of gypsum' still to be quarried, while others, equally well informed, affirm that the supply is fast running out. If the directors of the big concern accept the latter view then the quality will not prove to be an effective argument in favour of rebuilding. There are very powerful influences at work in opposition to rebuilding the mill at Hillsboro. At Sydney, N.S., the company own a splendid gypsum property, which lies right alongside of the main line of the Intercolonial railway and near the harbour, thus affording exceptionally good shipping facilities. Should the Georgian Bay canal be constructed, as no doubt it will be within a few years, the great western market would thus be brought nearer the products of the company. Hillsboro is unfortunately situated on a branch line of railway. The Salisbury and Albert is considered poor enough now, but if the revenue from hauling plaster were withdrawn it would become much poorer and would, perhaps, cease to be operated altogether. The disadvantages of an industry being located on a branch line is very great and this fact will no doubt be urged strongly against rebuilding in Hillsboro. Then again there will be the argument of centrality. Big plaster mills have been lately built in Paris, Ontario, Vancouver, B.C., and at other points. If the Albert Manufacturing Company hopes to compete with these mills it will be argued, that the company must secure gypsum quarries and build plaster mills at a more central point. These in brief are the arguments which will no doubt be urged at the coming meeting of the directors. Honourable Mr. Osman, the manager of the company, will stand up strongly for Hillsboro and Albert county. He will use his very best endeavour to convince the directors that a bigger and better mill should be constructed at Hillsboro, and that the work of rebuilding should begin at once. The outcome of the directors meeting, so fraught with vital interest to this county, will be awaited with eagerness, not unmixed with anxiety."

Albert Journal - Wednesday, May 17, 1911 Local News - Schooner 'Lockwood,' Captain Oscar Joston, cleared on Friday for New York with a cargo ofplaster shipped by The Albert Manufacturing Company."

Albert County Journal, Page 1 - Wednesday, July 25, 1917 Albert Manufacturing Company, Hillsborough, New Brunswick Calcined Plaster, Land Plaster and Rock Wall Plaster. A convenient wall plaster for farmers and others living in locations distant from central markets, where lime, hair, etc., necessary for use in making ordinary mortar cannot be procured without considerable delay. Rock Wall Plaster is put up in bags of 100 pounds each and is ready to apply to wall by the simple addition of sand and water. Rock Wall Plaster saves times, admits of carpenters immediately following the plasters giving the owner of the building weeks earlier than with ordinary plaster. Rock wall plaster a substitute for ordinary lime mortar and makes much superior wall. The most inexperienced plasterer can apply it. Try rock wall plaster"

Moncton Daily Transcript, Page 7 - Thursday, June 27, 1918 - Albert County Happenings - A three-masted schooner passed Hopewell Hill Saturday for Hillsborough to load plaster for the Albert Manufacturing Company. Vessels are scarce on these days. Time was when a fleet of fifteen or twenty three-masters could be seen in the stream at the Cape. Those were the days when the pilots had something to do. Now the vocation of these guides of the sea is practically gone."

Moncton Daily Transcript, Page 7 - Tuesday, October 21, 1919 - Albert County Happenings - The barge Ontario, in tow of the tug Mumford, came up to Hillsborough Thursdayto load plaster. Pilot Milburn brought the tow around from Spencer's

Codes: HILL / IDX_Names: Grey Brook Gypsum;

The Busy East, Page 17 - April - May, 1925 The Albert Manufacturing Company - (Reprinted from The Albert Journal of December 18, 1907) - About 1854 the Albert Manufacturing Company came into being at Hillsboro and to-day it stands as one of the leading industrial concerns not in New Brunswick alone but in the Dominion at large. Its history is the story of continuous growth made possible by the possession of remarkable quarries and by enterprise and insistence on up-to-date methods in all the branches of its operations. Now four quarries are operated, a finely equipped mill, recently enlarged, by the way, is kept continuously busy and thousands on thousands of tons of gypsum and plaster are annually shipped from the company's wharves at Hillsboro. To go back over the history of attempts to operate the gypsum quarries of Albert, or even those of Hillsboro alone, would make unreasonable demands upon space. Brief reference to the beds at Hillsboro may, however, be of some interest in the short article. Of these beds it may be said that they are the most valuable in the Dominion but prior to the year 1854 the only gypsum quarrying done in this vicinity was by farmers who sold small quantities to the captains of coasting schooners who, in turn, sold to United States men operating plaster mills. A little before 1854 two brothers from Maine acquired some property at Hillsboro on which were gypsum deposits but, about the year named Calvin Tomkins, a cement and lime manufacturer who had been carrying on business on the Hudson River, came Hillsboro and purchased the property owned by these men together with other lands on which were gypsum deposits. Soon afterwards came the organization of the Albert Manufacturing Company with which the years has become steadily of more and more importance among industrial concerns. Now the company has as it president Mr. Calvin Tomkins and as its secretary and manager Honourable Charles J. Osman of this town. These gentlemen with Messrs. Joseph T. Tomkins of Thomasville, Georgia, Walter Tomkins of New York and Rutledge I. Odell of New York, make up the directorate. When first the company began its operations it quarried at what are known as the Steeves and Whitehead workings. Later the development of the Smith, Green, Hamm and Sayre quarries came about and now the Sayre, Whitehead, Hamm and Smith are the quarries worked. Beside owning the land on which these quarries are to be found the company has large tracts of valuable timber lands, the extent of its property being something like ten thousand acres. What an asset those lands must constitute only a lumberman, perhaps, will fully realize but at present the company does not cut over the timber areas. Of course, the number of men working about the company's plant varies somewhat from time to time but it is usually somewhere in the neighbourhood of three hundred and twenty-five. Of the number about seventy- five are employed on the mill. In the quarries much of the work is done by contract and, strange as it may seem to persons with no knowledge of plaster making plants, the quarrying work is kept up throughout the winter. In the winter season, indeed, the quarrying is in some respects, carried on more advantageously than at other seasons for then the ground is hard and there is no sticky mud to bother the workmen. Occasionally both night and day shifts of men are kept at work so it will be seen that the difficulty does not lie in finding a market for the company's product. Between the different quarries and the company's mill and wharves a railroad of some six miles in length has been built over which the rock and plaster is carried. To the stranger it is a novel sight to see strings of cars, rock-laden, coming from the quarry yards to the mill hauled by one of the engines of a particular construction used by the company, or swinging to the yards from a quarry under the impetus of their own weight on a down grade. This railroad, by the way, has connection with the Salisbury and Harvey line. An examination by geologists shows that the gypsum deposits at Hillsboro are very varied in their character. This becomes clear also after spending some few hours with the quarrymen. Here, it will be pure white in colour, of varying molecular construction, and occurring irregularly. There, it will be grey, or greyish white, or perhaps it will be of a pinkish tinge and where in one, where it will occur in irregular masses it will elsewhere be found in seams which are comparatively regular. The rock, it may also be noted, varies in its hardness at different parts of the deposits. Several varieties or grades of plaster are of course, sent out from the company's works. First among these might be mentioned the land plaster. Land plaster, which is of a low grade, is used for fertilizing purposes. The largest portion of it which leaves Hillsboro is shipped to Quebec; Norfolk, Virginia; and Baltimore, Maryland. The crop on which it is used in the southern states is one of which we take little thought in this part of the continent, the peanut crop. Then there is the regular F grade calcined plaster, a general purpose plaster used for putty coat and other work of that kind. Another grade, the FF, is used for fine castings. A fourth grade is the dental plaster, a plaster of very high quality which is used by dentists throughout the Dominion. There is also a second grade of calcined plaster; terra alba which is used in the United States in the manufacture of paper pulp, as well as for other purposes; and the company's specialty, the noted Hammer Brand Hard Wall Plaster. Some years ago the company also quarried great blocks of magnificent white gypsum which it shipped to New York and Chester, Pennsylvania, at which places it was used in the making of pedestals, clocks, and various artistic ornaments. That however, is not now done. While there is much to interest one at any of the quarries it is the Sayre working which probably has the most attractions for the stranger. Here it is, by the way that the white or alabaster gypsum is found while the grey is found at all the quarries operated. At this quarry there are tunnels cut in under a bold hill and there the men get out great quantities of splendid rock, drilling and blasting by artificial light. At the present time acetylene gas is in use but before long electric light is to be installed and is expected to prove a considerable advantage. As one unaccustomed to such places enters the main tunnel there comes a sense almost of fear as inky blackness stretches before and there is the realization that one is walking through ways cut into the earth, hewn out of solid rock by man. Overhead, as one holds up a lantern, and peers through the shadows, one sees the roof of jutting rocks from which masses of gypsum have already been torn, some dull in their colour and others showing their striking whiteness even in the semi-darkness. It is in this quarry that the finest rock is found. All of the rock quarried here is not of a uniform high quality but in it there are found the great masses of almost pure white rock which delight the heart of the quarryman. Recently, when a Journal man visited the Sayre he was shown a magnificent mass of milky white stone which a blast of a few hours previous had brought crashing from the roof of one of the tunnels. Up in the roof there still hung tons of similar rock and one was able to secure an excellent idea of the way in which the gypsum sometimes occurs. Through the tunnels runs a railroad over which the rock is sent to the mouth of the main tunnel. When blasted out the rock is loaded into small cars which are then hauled to a point near the mouth of the tunnel. There the horses are unhitched and a strong cable fastened to the cars and up, up, they go, pulled by a powerful engine. At the other quarries the work is done in the open by the blasting and drilling. Once freed from the other rock the blocks of jagged stone may be stored in large sheds built especially for the purpose, until they become dry. Once dry they are ready to be sent to th mill to be ground and made into plaster. In small cars or hoppers, pulled by one of the engines, the rock goes down to the mill. There, in truth, it is the 'white kingdom.' Everyone, everything, is white with plaster or plaster dust. But for the one who is willing to brave the dust there is a great deal that much interest to be seen in the mill. The rock goes first to the 'crackers,' of which there are three kept constantly in use. The 'crackers' break the rock into pieces about the size of small nuts and then the pieces are carried to one of the five Sturtevant 'mills.' It is not long before the 'mills' have reduced the pieces of rock to whatever fineness is required. Then the resultant is elevated and sent on to bins and from the bins to the kettles. These kettles are huge affairs set in brick and having beneath them great furnaces in which soft wood is burned. Each of these kettles - there are four in the mill - is fitted with stirring arms so that the material placed in it may be kept in constant motion. A barrel of calcined plaster holds three hundred pounds and as each kettle has the capacity of sixty barrels, some idea of their size may be secured. When the kettles are filled heavy fire is kept on until a temperature of nearly three hundred degrees Fahrenheit is reached and then the plaster is 'cooked' and ready to be taken from the kettles. While the plaster has been 'cooking' the moisture in the gypsum has been driven off through openings provided for the purpose and with the steam there go off small particles of the gypsum which are collected in lofts and sent back to the kettles when the latter are again filled. This, considerable that would otherwise be lost is retained and in its turn goes to be packed into the plaster barrels. The great kettles are filled twice each day so it will be seen that upwards of five hundred barrels of the plaster are prepared daily. An interesting fact that may be noted in passing is that seven cords of wood are burned in the furnaces each working day. That will convey to some an idea of the extent of the operations at the mill. In the mill there are six bolts, two of silk for the finer grades of plaster, and four of wire. The plaster on being 'cooked' is again elevated and passes to these bolts. Thence it pours down chutes to the packing room and into barrels. The barrel stand on automatic packers which shake them as the plaster runs into them and thus it is made certain that each barrel which seems to be full has really received the whole amount which it is suppose to hold. Then the barrels are headed up, each being paper-lined, and are ready for shipment. In connection with the mill the company also has its cooper shop in which the necessary barrels are made. As in all the other parts of its plant the company has seen to it that the cooper shop is equipped in the best possible way. All the machines requisite to the making of a barrel from the wood brought to the mill yard have been provided. The company has recently completed the erection of a large addition to the mill, and addition made necessary by the growth of business. In this addition some machinery has been installed that will of itself materially improve the company's facilities. For instance, there are four splendid Parker grain packers, which have a capacity of one thousand barrels per day, and by these plaster will be packed. Then there are eighteen foot bolts besides other machinery that is required. All in all, the equipment of this addition is the best obtainable and cannot but affect the company's operations advantageously. The addition has already been used to some extent and in a short time it will be in daily operation. It is a building finely suited in every particular to the work for which it has been designed and its erection may be taken as some index of the present success of the company. What other extensions may soon be necessary one can only conjecture. While there are other concerns in the Dominion manufacturing a variety of plasters there is one plaster which is manufactured exclusively by the Albert Company. This is the famous Hammer Brand Plaster, the 'Practical' modern wall, plaster for which a patent has been secured. There is no plaster on the market today, if men competent to speak are to be believed, that is the equal of Hammer Brand Hard Wall. It is a plaster that gives a wall that is durable, tough, hard, and practically indestructible. Experiment has shown, and the Albert Company is markedly careful in all experimental work of the kind, that this plaster will not of itself crack, swell or shrink, nor will it come down in the case of leakage. Not only has the company proven this to be true but the experience of scores of purchasers has shown that Hammer Brand cannot be equalled. One of the most striking features about this plaster, and one that greatly increases its value, is that it is fireproof and it has been recognized by underwriters as a remarkable retarder of fire under all circumstances. Moreover, a number of builders have made use of it in the construction of special fire-proof partitions and have declared it to be a most admirable plaster. Another strong point in connection with Hammer Brand is that after its use the carpenter can immediately follow the plaster, and thus the work of preparing a building for occupancy is made much shorter than which ordinary plaster is used. Hammer Brand also had in its favour the fact that it is sure to give a splendid surface for the decorator or the paper-hanger. These, and other things may be set down as showing some of the advantages of using the company's Hammer Brand. Hitherto the market for the Hammer Brand has been chiefly in the Maritime Provinces and Quebec, large quantities having been used in Montreal. In Quebec the dealing in the plaster is steadily growing and there is no doubt that before long shipments will be going from here to the other provinces of Upper Canada and elsewhere. In 1877 the total sales of plaster in Canada were but eight thousands barrels. Twenty years later thirty- eight thousand barrels were sent out from Hillsboro alone for the Canadian market and disposed of. In 1877 the quantity of crude gypsum sent into the United States from Hillsboro was but five thousands tons, while in 1897 the shipments totalled over 50,000 tons. These figures tell more eloquently than mere words the story of the growth of the company's business. The superiority of the Hillsboro plaster becomes more clear to one, too, when one realizes that the increase of shipments to the United States has come in spite of an increased duty. One more group of figures may also be given here quite fittingly. These figures show that in 1905 the bulk shipments by the company made up a total of 125,000 tons. During the past summer the average output of the company's plant was about five hundred tons per week. Figures may, of course, ordinarily be 'dry' things but those given above assuredly have their interest as setting forth the development and expansion of the company. It may be said, too, that while the chief markets for the company's products are in Canada and the United States shipments have been and are still made to other countries as well. Even far off South Africa, though thousands of miles from Hillsboro, has sent its orders for the Albert Manufacturing Company's plaster. Shipments to South Africa have been made in the past few years, going via Saint John and Montreal. The grades of plaster sent to Africa are the F and the Hard Wall and there is every probability that the shipments will be greater as time goes on for the worth of the Hillsboro plaster soon brings an increased volume of business when once the plaster has been tried. The shipments made by the company by water reach figures which exceed the total of shipments of material of all kinds at many ports which are, perhaps, more generally thought of as important than is Hillsboro. Great steamers come here for cargo and go away loaded with the product of the company's quarries, while, of course, considerable carrying is done by many smaller vessels. Only a few days need to be spent in Hillsboro at any time to give one an idea of the extent of the shipments made by the company by water as well as by rail. One usually thinks of a prospector as a man who seeks to find deposits of precious metals. Prospecting, however, is frequently done by the Albert Company and gypsum, not silver or gold is sought. Indications of gypsum deposits which show signs of affording opportunities for profitable working, are found from time to time on the company's property by men who are in search of just such spots. When one is found sufficient work is done to determine whether or not there is prospect of such a return from the deposit as would warrant further operation. Otherwise, prospecting must be done elsewhere. There are, no doubt, valuable deposits yet to be found and working some at least of these will probably be part of the operations in due course of time. What the future will hold in this regard is, of course, uncertain but the signs about the property are promising in a marked degree. While its affairs are managed in the most strictly business like way, the company is not conducted as a concern the only object of which is the making of profits regardless of the treatment of employees. Mr. Osman in his management has ever shown an interest in all the men connected with the company. Not long ago a striking evidence of that interest was given by the opening of a club-room or reading room for the benefit of the employees. The club room is in a building which stands not far from the company's office on Main Street, and it is much appreciated by the men whose privilege it is to make use of it. Its opening has furnished another instance of the excellence manner in which the company's affairs are administered. The record of the fifty odd years since the company's organization is one which any individual concern might be pardoned for viewing with a considerable degree of pride. It is a record of an important business carried on in a way that has brought to the company a name for uprightness and a desire to increase its profits by fair methods alone. It is a record for enterprise and readiness in meeting changing conditions of trade, two unfailing signs of the successful merchant or company. It is a record of growth and expansion, a record of an important part in the development of the plaster trade in Canada and in the development of Albert County. It is no wonder that the people of Albert County and of Hillsboro in particular are proud of the company and of the place which it occupies. No company to-day has a more gratifying place in the industrial life of New Brunswick than has the Albert Company; few approach it in this regard. With stretches of its property still to be thoroughly explored by the prospector; with the continuance of the progressive policy which has marked its operations hitherto; with the spread of the name of its products and the consequent enlargement of markets already opened and the opening up of new avenues of trade; with these and other things borne in mind one is convinced that the growth of the past half century will be eclipsed by that which will be evident as the years pass on. From 1907 to the present time. - In the month of March 1911, the plant above shown was entirely destroyed by fire. The mill had been closed down for several weeks, during which time extensive and expensive repairs had been made, to place it in a good state of efficiency, preparatory to undertaking what promised to be a very busy season. It is a coincidence that the mill was to resume operations on the day of the fire. When the alarm was given employees and citizens flocked to the scene, and while every human effort was made to control the flames, it was soon seen that the fire was beyond control, and in a short time nothing was left of this fine plant but smouldering ruins and twisted and wrecked machinery. Much doubt was expressed as to whether the mill would be rebuilt, as owing to severe competition the product of the mill had of necessity, to be disposed of at prices which were not remunerative. The manager, the late Honourable C. J. Osman, proceeded to New York, and after consultation with the Directors of the Company, was able to satisfy them that the mill should be rebuilt, and to further encourage the undertaking, a meeting of the citizens of Hillsboro was called by leading and influential men. The meeting was largely attended, and it was unanimously decided to recommend to the Municipal Council that the Company be exempt from taxation for a fixed period of years. This action of the citizens was greatly appreciated by the officials of the

Company, and subsequently exemption was granted. The work of clearing away the old site was commenced. contract was let to the firm of Rhodes, Curry and Company of Amherst for the new plant, which in 1912 was in operation. After a discontinuation of business for a period of twelve months, it was naturally expected that the trade supplied from the old plant had become scattered and difficult to regain, but it is a compliment to the loyalty of the old customers of the Albert Company to say that, without a single exemption, they resumed business relations again as soon as the new plant commenced operations. The present line mill, as shown herewith, is regarded as one of the most modern on the continent and is equipped in the most up-to-date manager. It consists of a group of four buildings. The Power Plant is housed in building No. 1. This is a brick and concrete structure, absolutely fireproof and contains a battery of three boilers of the Robb Engineering Company's manufacture. The boilers are of 450 horse power each, also an engine of modern type of 900 H.P., which is more than sufficient for all demands at present made upon it. Building No. 2 contains primary and secondary crushers, Seven Sturtevant Vertical Emery Mills and necessary elevating and conveying equipment. In this plant the raw material is reduced to a fine powder, and thence conveyed to Building No. 3, which is equipped with six retorts of Butterworth and Lowe construction. These retorts are for calcination purposes or for what is more familiarly known - for boiling the plaster. This same building is equipped with bolting facilities, modern packers for filling both bags and barrels and contains also, warehousing and shipping space and facilities for handling the finished product. Spur lines of railway connecting the plant with the line of the Canadian National Railway permit the economical conveying of the products of the plant to the main line. Building No. 4 is the Cooper Shop, containing modern machinery for the manufacture of barrels, and when operating to capacity is one of the busiest places in the Maritime Provinces; about a thousand barrels represents the daily output of skilled coopers in this shop. The business of the company has steadily increased during the past twelve years and at the present time, not only the Canadian market is supplied with the products of this plant, but they find their way to all parts of the world. By every monthly sailing of the Canadian Government Merchant Marine boats from the ports of Saint John, Halifax and Montreal, considerable quantities of 'Hammer Brand' Plaster are exported to south Africa, Australia, and New Zealand, and upon occasions shipments are made to Japan. On the 13th day of April 1922, the Company suffered its most severe loss through the death of the Manager and President, Honourable C. J. Osman. Mr. Osman had been identified with the affairs of the Company for a period of about forty-five years, and was most favourable known and respected throughout Canada and the United States. Mr. F. M. Thompson, who had been associated with Mr. Osman for about thirty years, succeeded to the management and continues in this position at the present time. The Company has in prospect the erection of a plant for the manufacture of Plaster Boards, for which product there is a growing demand in Canada and elsewhere. such a plant would of course provide additional employment for the people of the community. The business of the Company is carried on unostentatiously but apparently effectively, and the

S.J. Daily Sun - May 16, 1893 and Moncton Daily Times - May 17, 1893 Albert County. - Result of the Mining Court Session at Hopewell Hill. - Hopewell Hill, May 15. - On Thursday last the surveyor general, accompanied by Mr. Loggie and stenographer, arrived at Hillsboro to hear and determine upon certain applications under the Mining Act. There were protests filed in two cases, one by Charles Archibald against Frederick Steeves and others, which related to the territory embracing the celebrated Baltimore shales. Messrs. Steeves and W.F. Wortman were present, and C.A. Peck, Q.C., of this place, appeared for Archibald. A compromise arrangement was entered into by which the interests of the different parties became amalgamated, to the satisfaction of all concerned. In the other case, that on the petition of Barnett and others, for renewal of license held by J. DeWolfe Spurr, and in which Fen. Fraser had filed a protest, C.A. Peck also appeared for Barnett and others. C.J. Osman appeared, claiming exemption of certain lands held by the Albert Manufacturing Company. He also filed a protest on behalf of the Messrs. King, of New York, as to a portion of the territory. Mr. Peck assented to the exemption of the Albert Manufacturing Company's lands (only about 25 acres), but resisted the other protests on grounds held good by the surveyor general. It was ordered that a lease of renewal of rights be issued to Messrs. Barnett et al. This is said to cover the famous Albertite area."

Moncton Daily Times - Dec. 29, 1882 Albert Co. - The Albert Mfg. Co., at Hillsboro,has closed the plaster and lumber mills for the winter. From List of Recorded Earthquakes in New Brunswick, by Samuel W. Kain, Bulletin XVI of the Natural

History Society of New Brunswick, 1898. - Dec. 31, 1882; 9.56 p.m. - St. John, Rothesay, Sussex and Fredericton.Light. Two shocks felt. The following is from the St. John Daily Sun (January 2nd, 1883): At four minutes to 10 on Sunday night, a slight shock of earthquake was felt. In one residence on Charlotte street a vase was thrown from its stand to the floor and broken; in another house, in an opposite part of the city, all the ornaments on a Christmas tree were set swinging vigorously. The shock was also distinctly felt in Indiantown and on the other side of the harbor. It was also felt at Sussex, Fredericton, and very markedly at Rothesay."

Codes: HILL / J8 / IDX_Names: Grey Brook Gypsum; Albert Mines;
S.J. Morning Journal - Apr. 26, 1867 Albert Co. - ... As regards mining matters in Albert there seems to be little change. No large veins of Albertite, beside that at the Albert Mine, have been as yet discovered, though the East Albert and Princess Alexandra Companies have been spending large sums of money in the research. The East Albert vein presents a very interesting study to the Geologist. It was discovered on the summit of the hill in Lower Hillsborough in the thin layer of limestone, capping the conglomerate; it was about six inches in thickness, and dipped at an angle of 80ø. A shaft was sunk to the depth of fifty feet, and a drift ran to the vein which was in a cavity in the conglomerate, filled with soap stone and pebbles. The miners passed through this and struck the opposite wall without noticing the vein. On working back, however, it was discovered in appearance like a line drawn by a black lead pencil, but, on following it for a few feet, it became a pocket of Albertite fifteen inches in thickness. A quantity of the material in this vein is elastic, and will bend almost like India rubber. I am informed that a shaft has been sunk upwards of two hundred feet in another place, and this vein drifted to but that no increase in the size has occurred.Plaster, Etc. Operations in plaster are being carried on but to a limited extent. A new quarry has been opened up at Hillsborough, from which some cargoes will shortly be shipped. Plaster is very abundant in Albert, but it is unfortunately at some distance from the sea. There is one cliff of it on the Demoiselle Creek which is 130 feet perpendicular in height, forming in summer a very picturesque object. The pure white of the Gypsum contrasting pleasingly with the dark green foliage crowning its summit. Here may be seen a very clearly defined and extensive synclinal or inverted curve, which shows for a distance of some hundred feet exhibiting well the structure of the rock. It is sometimes dangerous to walk through the woods which cover the plaster formation when snow is on the ground as frequent indentations in the surface are met with. Many of these are so deep that Moose and other animals have, on former times, lost their lives by falling into them, a fact that is proved by their bones now lying in the bottoms of these holes. In my next letter I will be able to give the many readers of the Morning Journal some account of the present state of the operations in Manganese, as well as of the veins of copper in this county."

Morning Journal - Jul. 12, 1867 At Hillsborough we begin to see indications of the mineral wealth of Albert County assuming a practical form. Very near the town situate on a fine expanse of interval near the river brink are the plaster mills of which Mr. Tompkins is the manager and part proprietor. Other members of the company reside in the state of New York, which is Mr. T.'s native state. He is particularly courteous, obliging and well informed. The works are the most extensive of the kind on this continent, and so far as known, in the world, and represent a large amount of capital. They include machinery (propelled by steam power) for breaking, grinding, and calcining the gypsum - for preparing it by one process for agricultural purposes, and by another for building purposes; also for making barrels, &c., &c. Indeed the works include the machinery for a grist mill which can be used if required, and worked by the steam power which is provided. The shipments of plaster are sent chiefly to the United States, to which about 25,000 barrels of plaster for building purposes are some years shipped and much more might be shipped were the tariff more favorable. It is met by a duty of 20 per cent in gold. Rock plaster for agricultural purposes is also shipped to the States, and the former kind, the stucco, sometimes even to Australia; lately a shipment of 400 barrels was made to Melbourne. The gypsum is hauled over a tramway of about three miles and a half in length. One horse can haul four loads of five ton each in a day, which involves a cost of eleven cents a ton. Including men who are working on roads, the works employ, at present, over 80 men. Some of these are, however, employed in making barrels. When the wood is prepared ready to be used one man can make as many as 18 barrels in the day; he receives nine cents a piece for them. They turn about 300 barrels a day. There is a fair margin of profit in the plaster business, which would be greatly increased if only the United States would consent not to make their own people pay so much for the plaster used in constructing their dwellings. The building of the railway - for which Mr. Tompkins generously offers his tramway, so far as it goes - would also help to increase the profits by lessening the cost of carriage.

Of course this railroad must and shall be built. Ask Mr. Smart the contractor for the St. Stephen branch, or Mr. Buck; the engineer, of the same, ask the owners of the Saint Stephen Company or the Woodstock Company, whether or not the thing can be done, and they will tell you that the people of Albert County in general, and its public men and mining interests in particular ought to feel for ever disgraced if they do not build a branch railroad, which $50,000 in addition to the subsidy will be more than sufficient to construct and equip. But more of this anon.The famous Albert Mines are situated about five miles from Hillsborough. The appearance and value of the beautiful substance called Albertite and its history are so well known that we need not say any thing about them. On reaching the scene of operations a little village comes to view, as well as the buildings specially connected with the mining operations. Two shafts of one thousand feet each, have been sunk, and the supply of Albertite is taken from a vertical vein or rift or chasm which as followed in its descent still yields the precious deposit. Whether the supply is inexhaustible, or may soon be exhausted, is not known. No veins of equal extent have been found in the county, not withstanding a very large expenditure made in seeking for them. Small veins of equal quality have been found, but not as yet of sufficient extent to warrant mining operations. We were told that there are a hundred persons in the employment of the company, that from 18,000 to 20,000 tons of Albertite are annually taken out of the mines, more than half of which is shipped to Portland for the manufacture of oil, the other half being divided between Boston, where it is used in making gas, and St. John, where it is also made into oil. The value of the deposit is about $10 per ton, in gold, delivered on shipboard, and it is said that the cost of mining is about equal to one dollar per ton. The Albertite pays dividends to the non-resident company of over one hundred per centum, and a small royalty of 20 cents per ton to the province. The United States derives a large import duty, besides a heavy internal revenue tax from the article, which taxes are afterwards paid by all persons who purchase the oil in the British Provinces. In consequence of the manufacture being carried on in a foreign country, while a market is supplied in our own, this valuable deposit contributes more to the wealth of another country than that of our own. This is partly owing to the fiscal causes at work in both countries, and partly owing to the fact that our own people of ample means hesitated to take the risk of experimenting in the working of this valuable deposit. - Should the supplies of Petroleum shortly diminish to any considerable extent, the Albertite and also the oil bearing shales of this County, of which we shall hereafter speak, would be enhanced in value to

Daily Telegraph - Oct. 7, 1869 ...It is also said that the damage done to the Albert Plaster Mills and stores connected there with will not be less than $20,000. Albert Mines coal wharf was washed away with $6000 worth of coal there on, and about one-half mile of track is gone."

S.J. Daily News - Oct. 8, 1869 Storm damage article... The extensive plaster mills and warehouses were entirely surrounded by water and suffered extensive damage. A large quantity of manufactured plaster is damaged, and an immense quantity of material of various kinds has drifted away, and is rendered more or less useless. The plaster wharf and railroad are also broken up and scattered in all directions. It was feared at one time that the water in the boiler room of the establishment would cause an explosion, but no accident of this kind occurred. The Albert Mining Company's wharf, with a large quantity of coal, is completely scattered, a portion of their buildings destroyed, and the railroad broken up and driven away a distance of over a mile."

Daily Telegraph - Nov. 2, 1874 Edgett Landing. - ... Some years ago there was a plaster quarry opened here by Messrs. Howell & King, who shipped it at a pier in the neighborhood. Since the death of Mr. Howell, however, there has been little done here. We may also mention that there is another quarry at Hillsboro, owned by Mr. Blight, at the head of the ""Lake"". At Edgett's Landing considerable work has also been done by the East Albert Mining Co., under the superintendence of Mr. Blight, who is said to be in charge of three companies, namely, the ""Princess Alexandria,"" the ""Prince of Wales,"" and ""East Albert;"" and although small veins have been found in those places, as we have already intimated, the result has not

Codes: HILL / J8 / IDX_Names:Grey Brook Gypsum; Albert Mines;

Chignecto Post - Sep. 9, 1880 Albert County.- The plaster mills of the Albert Manufacturing Co. are the features of Hillsboro'. The plaster rock is procured from quarries about three miles distant, and taken by rail to the mills, where the greater portion is shipped by vessel to Newark, N.J., where the Company manufacture it into plaster. The heavy duty prevents it being manufactured here for exportation. These quarries have been worked some 21 years, and are likely to yield abundantly for many generations to come. About 20 men are employed in them at present, under the direction of Mr. Wm. Shaugnessy, who has had a long experience in the work. The rock here has been excavated to a depth of about seventy feet. At the mills the rock is converted into plaster for use in the Dominion. The rough rock, being broken into pieces of convenient size, is placed in the crackers, which are something in the style of a coffee-mill, and reduced to small bits, the two crackers crushing about 125 tons a day. From these it goes by elevation belts to the hoppers, and is finally carried in the same manner, to the stones. These are four in number, and are on the same principle as millstones, five feet in diameter and made of granite. From the stones it emerges a fine powder and is carried to the bins, which are four in number and have 500 barrels in them at a time. Beneath these are four kettles which hold about 55 bushels each, and into which when heated the plaster is slowly deposited until, after the space of an hour and a half or two hours, they have the quantity desired. In these the intent heat of the furnace expels all trace of vapor from the plaster, which boils like water, and the steam escapes into a loft above. When the plaster is properly calcined, it is carried into pens, placed in barrels holding 300 pounds each, and is ready for market. Everything is done by machinery, which works to perfection, and though the mill is rather a dusty place for a man with black clothes, the process is well worth seeing. All the coopering and joiner work is done on the premises. The machinery is driven by a double engine of 125 h.p., of American make, the admirable mechanism of which is worthy of high praise. The mill can turn out about 500 barrels a day. The foreman is Mr. Elias Davis, who has been there some 21 years. The mill employs about 40 men. Besides the calcined plaster, the stone is ground, but not calcined, for use as fertilizer, the coarser and darker kinds being used for this purpose. It should be remarked, however, that dark rock and that which is pure white are alike equally white after passing through the furnace and being purified by fire. The Albert Manufacturing Co. is composed of Americans, Mr. Tompkins being the resident manager. It was at the house of this gentleman that Bayard Taylor sojourned when he visited Hillsboro' a few years ago. The poet-traveller did not unduly flatter this part of the country in his published letters ... I have before me two specimens of the mineral products of Albert Ore, a stone as white as driven snow, is the best quality of gypsum, form the Hillsboro' quarries. The other is as black as jet and shines with a brilliant lustre. It looks like coal, but it is not coal, though it bears a close resemblance to that mineral than to any other substance. Its weight is light in proportion to the bulk, it gives forth a peculiar odor such as kerosene has, and when a match is applied, it freely burns with a brilliant flame. It is the famous Albertite, it came from the depths of the deepest mine in America, where men toil for it, at the depth of 1,562 feet from the surface. So much has been written of the Albert Mines that an attempt to describe them would be out of place. They are the only ones of the kind in the world, and for thirty years they have been supplying Albertite to the gas works of America. The Albertite is commercially spoken of as coal, but it more resembles naptha in a solid state. It is used in gas works, in connection with other coals, for purifying, etc., and though in modern methods of gas making its use can be dispensed with, it is still largely demanded. Burning oil was formerly made from coal, but since the opening up of oil wells the process has been found too expensive, and Albertite oil is now a thing of the past. It is a pity, for it will be remembered as an illuminator far superior to the kerosene of these days, and in point of economy and comfort it was far in advance of the American rock oil, and immeasurably to the abominable Canadian trash with which so many of our people are familiar. In the raising of coal, large operations have been carried on here in the past. In one year 22,000 tons were raised, but in other years the quantity has been very much smaller than this. Of late the shipments have been small, for the mine has seen its best days, and will never yield as it did of yore. The Albertite has sold at all prices from ten to twenty one dollars a ton, the present price being about sixteen dollars. Every scrap of the mineral is now being cared for, and places which were treated with contempt in other years, because the coal was small in quantity and difficult of access, are now being dug out and graped in. The stockholders are chiefly Englishmen, and their investment has paid them well, the profits at one time being two hundred per cent. Some 85 men are now employed at the mine, many of these men have grown grey in the service and are familiar with every portion of the works. The machinery is, of course, extensive and of the best description. One notable portion is the pumping engine of 600 horse power, with a cylinder twelve feet long and five feet in diameter and which throws 45 gallons at a stroke. The engine is of Philadelphia make. Rich and rare are the fossil shales from the mines, and the specimens of fish, etc., found in the shale are in the collections of geologists the world over. Some of them are remarkable for their distinctness and beauty. It is a question how much more Albertite is in the country. It is believed that equally rich mines exist if they can be found, but though traces of the coal have been discovered in various places, no large deposit is known. It a mine were discovered it would probably be of less value than many imagine, for the abundance of the mineral would cause it to be much more than equal to the demand, and render it a drug upon the market. It is alleged that a well known prospector, now deceased, actually found Albertite in abundance only twenty five feet from the surface, but upon the discovery immediately ceased operations in that locality. It was supposed that he intended to keep his secret until the proper time came, when the other mines were exhausted. The Albert Mines and the Plaster Works have done very much for Hillsboro', and have given it an importance which it would otherwise never have

Moncton Daily Transcript - Feb. 9, 1888 and S.J. Daily Sun - Feb. 11, 1888 The N.B. legislature will be asked to pass an act to incorporate the Albert Mining, Manufacturing, Quarrying and Shipbuilding Co."

Moncton Daily Times - Feb. 13, 1888 Albert County. - Application will be made to the Provincial Legislature at its next session for an act to incorporate the Albert Mining, Manufacturing, Quarrying and Shipbuilding Company."

Moncton Transcript - Aug. 25, 1893 Contested Mining Leases. - Two cases heard before Surveyor General Yesterday. -

Surveyor General Tweedie arrived in this city by yesterday afternoon's accommodation from North to hold examination into two contested cases of mining leases. The meeting was held in the Brunswick House and the evidence in the two cases taken. The lands of one were situated at Dorchester, Westmorland, and the other was at Edgett's Landing, inAlbert Co. In the first case applications were made by Thos. Caldwell and others for prospecting licences on a large number of areas upon which areas old mining operations had been carried on by Messrs. Eaton and Jewett, of Massachusetts. The latter parties claimed to have purchased all the mines and minerals from one Chapman, of Dorchester. At the date of the mining operations of Messrs. Eaton and Jewett, they were aliens and the question largely hinges on this point. Messrs. Tweed, Hanington & Hewson appeared for Messrs. Eaton & Jewett, and Mr. A.L. Robinson for Thos. Caldwell and others. All the evidence in the case is in and the Surveyor General will give his decision in a few days. In the other case at Edgett's Landing thecontesting parties were Messrs. V.C. and C.V. King, of New York and Miles Peck of Hillsboro. The Kings twenty- two years ago were carrying on large operations on this property, but abandoned it after one year. Miles Peck's father was their agent and died some three years ago. Miles Peck claims that as he paid taxes on the land and is in possession that the mining leases should issue to him. Mr. C.A. Peck appears for Miles Peck, who claims that the mortgage given by Miles Peck to the Kings is by limitation of time null and void. J. Howe Dickson, of Hopewell Cape, appears for Messrs. King and both parties have filed applications under the mining act for licences. The surveyor general heard all the evidence in the case and will decide the matter in a few days."

Kings County Record - May 16, 1930 The Natural Resources Of New Brunswick. - Interesting Paper Read by Mrs. Wm. King at Meeting of Newtown Women's Institute. - ... Our MineralResources. - More than 25 minerals of economic importance have been discovered in N.B. While considerable development work has been done, comparatively little headway work has been made. At the same time, N.B. may yet prove a great source of mineral wealth. Coal is the principal mineral mined - in Minto, Queens county. Gypsum is second in importance. Large deposits ofan excellent quality of this mineral are to be found near Hillsboro, Albert Co. The Albert Mfg. Co., Hillsboro, manufacture and export large quantities of commercial gypsum annually. It is one of our largest manufacturing concerns. Much gypsum rock is also shipped from Hillsboro. Natural gas and oil are produced in Albert county, nine miles south of Moncton. The gas is used for domestic heating and lighting in Moncton and Hillsboroand to some extent for power. The oil taken from the same wells is sold chiefly to the Canadian National Railways.Granite quarries are located in St. John, Charlotte and other counties, where granite stone is quarried for building purposes, monuments, etc.Limestone is found in many parts of N.B. The principal lime plants are in St. John county, where large quantities of commercial lime are produced. Last year nearly 13,000 tons of ground lime stone was ground from limestone rock by the Brookville Mfg. Co and sold to the farmers in all parts of the province. The use of ground lime stone for most of our soils has been found very beneficial and profitable to use.Brick is made from our clay in several places.Grindstones are manufactured and exported. Boring has been done in several places for copper, oil shale and other minerals but no great development has yet resulted. The value of the mineral production for New Brunswick in 1927 was $2,148,535."

Codes: HILL / O3 / IDX_Names:Grey Brook Gypsum; Hopewell Gypsum;

Moncton Daily Times - Feb. 18, 1878 Mr. C.T. Tompkins, of Newark, New Jersey, formerly in charge of the Plaster Works, Hillsboro, is getting out a large quantity of plaster from his quarry near the old Chemical Works (so called), about two miles from Hopewell Corner. The plaster is being hauled to Shepody River for shipment. 25 teams are employed, hauling about eight tons each per day. Capt. Joseph McAlmon, of Bacon & McAlmon, is agent for Mr. Tompkins. Mr. Astel Steeves, of Hillsboro, an experienced man, has charge at the quarry. This plaster is said to be of superior quality. Though of a decidedly bluish tint in the rock, it is very white when manufactured. From appearances at the quarry one would suppose the supply inexhaustible. The foreman at the quarry represents it as very easily quarried, there being no hard plaster, called bull, to contend with as at Hillsboro - which is a self-evident fact, as 10 to 12 men quarry over 200 tons per day. From the near proximity of this deposit to the Albert Railway and a port of shipment, the chances are that 'ere long mills will be erected to manufacture it near the quarry, which will greatly benefit the surrounding district."

S.J. Daily Sun - Dec. 2, 1893 and Moncton Daily Times - Dec. 4, 1893 Albert Co. - Mr. Atkinson thinks the lime and plaster industry will develop considerably this winter. The firm of King, Dimock & Co., which has its headquarters at Windsor, N.S., own valuable plaster worksat Curryville. The Red Beach company have quarries at Hopewell Hill."

S.J. Daily Sun - Mar. 6, 1895 Albert Co. - Fine Quality of White Plaster Discovered at Hopewell. - Hopewell Hill, Feb. 26. - Capt. Albert Stiles, who has been prospecting for gypsum on his farm at Hopewell, has discovered what is supposed to be a very fine quality of the white plaster, with satisfactory indications in regard to quantity. The captain has secured mining privileges from the owners of the farms adjacent."

Chignecto Post - Sep. 2, 1880 Albert County.-... Pleasantvale ... It is also alleged that a coal mine exists in this vicinity on the banks of the Little River. I had a talk with the man who found this mine, and is the only one who knows of its existence. He gives mysterious hints as to the locality, but will not show the spot to any one for a less sum than $500. The value of this mine has yet to be determined; the discoverer is not sure that it is worth anything, but simply and purely walks by faith. He also assured me that he had found a lead of quartz, with lumps of what he believed to be gold in it. I have found quite a number of these mine finders in this county, but, somehow or another, capitalists are slow to run wild over their discoveries. It is quite a common thing to be shown a lump of something claimed to be manganese, and to hear dark hints that there is more of the same kind not far away. In some districts nearly every man who owns a farm has a mine or quarry of some kind developed at a future day... Hillsboro... Derives much of its repute from the splendid quarries of gypsum in its vicinity, and from the famous Albert Mines, five miles distant. The export of these minerals has caused it to become quite a port for small shipping..... The Plaster Mills of the Albert Manufacturing Co, are one of the features of Hillsboro'. The plaster rock is procured from quarries about three miles distant, and taken by rail to the mills, where the greater portion is shipped to Newark, N.J., where the company manufacture it into plaster. Stone, etc.; Albert Mines;

S.J. Daily Sun - May 10, 1886 Albert County (The Weekly Observer). - ... Albert County is rich in minerals which have not yet been properly developed. The coal, gypsum and freestone mines are about the only ones worked and these are imperfectly developed for want of sufficient capital.In 1881 the output of coal was 18,368 tons, of gypsum 435tons, of freestone 81,948 cubic feet. To persons withplenty of capital there are many excellent opportunities for profitable investment in stone quarries and other valuable minerals. A ready market for freestone is found in the United States, where it is worth at least $14 per ton. The estimated cost of quarrying and placing this stone on ship board is $4 per ton, so a healthy profit ought to remain after paying freight and other charges."

Moncton Daily Transcript - Apr. 11, 1890 District Geology. - Mr. Chalmer's Work in Westmorland and Adjoining Counties. - The latest report of the Department of the Interior states that Mr. Chalmers, of the Geological Survey, was engaged during the summer in studying the superficial deposits of southern New Brunswick, including the counties of Kings, Albert and Westmorland. The survey of the surface geology of this area is now completed, at least so far as the nature of the country will admit of such being done in detail. Considerable portions are still unsettled and in a wilderness state, and in these of course, the study andmapping of the surface deposits could only be done in avery general way. Maps and reports with reference to thisdistrict are being prepared. Mr. Chalmers further reportsas follows: The glaciation of the eastern part of the area in which lies the north eastern extension of the ridge or plateau bordering the Bay of Fundy, was investigated with some care, and facts of much interest discovered. This ridge forms a prominent feature in the landscape, being higher than any other part of the country except the northwestern highlands or the Gaspe Peninsula. Here, therefore, we might naturally expect to find traces of a continental glacier, if such ever swept over the eastern part of New Brunswick. None were observed, however; on the contrary, great masses of decayed rock in situ encumber its northern and northwestern flanks, while along the valleys of rivers descending from it northwardly into the Petitcodiac striae were found clearly indicating northerly ice movements. Along the Petitcodiac valley, however, which lies below the 200 feet contour line striae were seen to follow its course, showing ice movements in an easterly direction. It is evident that local glaciers and icebergs were amply sufficient to produce all these phenomena. On the summit of the Bay of Fundy ridge or plateau referred to, local areas which served as gathering grounds for glaciers sent some of these off towards the Bay of Fundy. A large number of facts relating to the glaciation of this district will be given in the annual report. District Mineral Resources. - In the enumeration of the mineral resources of this section, Mr. Chalmer's report says that brine springs are found at Sussex, at Salina, on Salt Springs Creek, and at Bennet's Brook, near Petitcodiac. At Bennett's Brook nothing has been done to utilize the springs there, to his knowledge. In all these places the brine contains a considerable percentage of sulphate of lime or gypsum. There appears to be less, however, in that of the Sussex springs than at Salina or Bennett's Brook. Medicinal springs are met with at Apohaqui and at Havelock Corner, Kings Co. The Havelock mineral water has, for some years, held a local reputation as a remedy for certain diseases; and as an extensive deposit of mud surrounds the spring, it might be utilized for the establishment of mud baths, which are said to be beneficial in the treatment of some diseases. Infusorial earth has been reported at Pollett River, Kings Co. Subsidence of the marshes. - Mr. Chalmers further says: I visited the Ship Railway now under construction across the Isthmus of Chignecto. In an excavation which is being made for the docks in the salt marsh at its western end, the following series of deposits is disclosed;- (1) marsh mud, 5 to 10 feet; (2) fine grained, stratified blue clay, holding numerous shells - thickness, from a few inches at one end to five to eight feet at the other; (3) peat or humus, six to fifteen feet thick, containing roots and stumps of small trees, chiefly haematae, and in some places portions of the stems. This peat or forest bed evidently grew on a sloping bank at the border of a lagoon or quiet inlet. The lowest part of it is now twenty feet or upwards below the level of high tides in the Bay of Fundy. At Aulac station, Intercolonial Railway, which is on the great Tantramar salt marsh, a boring 305 feet deep, was put down under the direction of P.S. Archibald, chief engineer, Intercolonial Railway. This boring shows likewise (1) marsh mud, eighty feet; (2) turf and bog; (3) red clay, &c. These facts clearly establish the conclusion that a subsidence has taken place here since the growth of the peat beds, and confirm the observations made previously by Sir J.W. Dawson."

City Gazette - Sep. 1834Exports include plaster and limestone"
Cap. 98, repealed. Passed 10th April, 1875 Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly:- 1. The capital stock of the Sussex Lime and Plaster Company incorporated by the Act thirty seventh Victoria, Chapter 98, shall be twenty thousand dollars, instead of fifty thousand dollars, as provided by the said Act. 2. Section twelve of the said Act is hereby repealed. 3. Unless ten per cent of the capital stock of the said Company provided by this Act shall be bona fide subscribed within one year from the passing of this Act, the operation thereof shall cease, and the existence of the said Company shall terminate."

Royal Gazette - Jul. 1, 1874 CAP. XCVIII. An Act to incorporate the Sussex Lime and Plaster Company.Sec. Sec. 1. Company incorporated. 8. Principal office, 2. Capital stock. where established. 3. First meeting, where held 9. Transmission of and by whom called. interest in share, 4. Liability of shareholder to other than ordinary Company. transfer, how made. 5. Assessments upon shares, 10. Responsibility of how ordered. shareholder for acts 6. Shares not tranferable until of Company. all calls are paid. 11. Company may borrow 7. Annual meeting to be held. money; proviso. 12. Amount to be subscribed and paid in within one year. Passed 8th April, 1874 Whereas the Parish of Sussex, in the County of King's, offers advantageous situations for the quarrying and working of lime stone, and quarrying and manufacturing of plaster; and for procuring the requisite capital it is desirable to incorporate into a body politic and corporate such persons as may be willing to advance funds for such undertaking:- Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:- 1. William Pugsley, Junior, James Christie, M.D., John M. Smith, J. Herbert Crawford, M.P.P., Robert Pugsley, and James W. Nowlan, M.P.P., their associates, successors, and assigns, shall be and they are hereby erected into a body politic and corporate, by the name of ""The Sussex Lime and Plaster Company,"" and by that name shall have a common seal, sue and be sued, plead and be impleaded, answer and be answered unto, defend and be defended, in all Courts and places whatsoever, and shall have power, right and authority to purchase, hold and enjoy lands, tenements and heriditaments for them and their successors and assigns, and all other powers and privileges now incident to a Corporation by any Act of Assembly of this Province, for the purpose of quarrying, manufacturing and trading in plaster and limestone, conveying the same to market, opening and working quarries, and other business connected therewith; and also that they the said Company, or a majority of them, shall from time to time and at all times have full power and authority to constitute, ordain, make and establish such bye laws and ordinances as may be deemed necessary for the good rule and government of the said Corporation, provided that such bye laws and ordinances be not contradictory or repugnant to the laws and statutes of this Province, and those in force within the same. 2. The capital stock of the Company shall be fifty thousand dollars, with liberty to increase the capital stock to one hundred thousand dollars, to be divided into equal shares of twenty dollars each, to be paid in at such times and instalments as the business of the said Company shall require and every person who shall be a holder of one or more shares shall be entitled to vote, either in person or by proxy, having one vote for each share as aforesaid; provided however, that it shall be lawful for the said Company, or a majority of them, to establish by their bye laws as aforesaid, the number of shares which shall be necessary to entitle the holder thereof to more than one vote; and it shall be lawful for said Corporation to grant certification of paid up stock, in whole or part payment for the consideration of lands, quarries, buildings, machinery, mining rights and privileges in the place of money subscription to said stock, at such valuation as a majority of all the stockholders present or represented at any meeting shall fix. 3. The first meeting of the said Corporation shall be held at Sussex Vale, in King's County aforesaid, and shall be called by William Pugsley, Junior, or in case of his death, neglect, or refusal, by any two of the said Company, by sending a written or printed notice to each member of the said Company, at least ten days previous to such meeting, in order to organize the said Company, and for the purpose of establishing bye laws, choosing Directors and such other officers as may be necessary, which Directors and officers so chosen shall continue in office until the the first annual meeting, or until re-election, or others are chosen in their stead; and the members of the said Company, or shareholders present or appearing by proxy, shall organize said Company, establish bye laws, and choose Directors of the said Company, by a majority of votes. 4. Each and every shareholder in the said Corporation shall be and be held liable to the said Company for each and every call or assessment made, not however to exceed in amount the stock subscribed by him, for the purpose of enabling the said Company to pay the debts and engagements of the said Corporation, or for the purpose of carrying on the operations for which the said Company is incorporated; which call or assessment may be sued for by the said Corporation, and recovered in any Court of Record within the Province. 5. The Company or the Directors, if empowered by the bye laws of the Corporation, shall have power from time to time to levy and collect assessments upon the shares, or upon such of them on which the amount subscribed has not been paid up, of such sums of money as may be necessary for carrying on the business, or for the purpose or operations of the said Company; and whenever any assessment shall be made as aforesaid, it shall be the duty of the Treasurer of the said Company to send a written or printed notice thereof to each shareholder, requiring payment of the same within thirty days, and if any stockholder shall refuse or neglect to pay to the Secretary or Treasurer the amount of such assessment upon his share or shares at the time in such notice prescribed, the same may either be sued for and recovered in the prescribed in the last preceeding Section, or the Secretary or Treasurer may advertise all such delinquent shares for sale at public auction, giving at least thirty days' notice in writing to such shareholder, of the time and place of such sale; and all shares on which the assessment or any part thereof is not then paid, with interest from the time such assessment became due, may be sold to the highest bidder; and after retaining the amount of such assessment, and all interest due thereon, and all expense of advertising and selling, the residue (if any) of the moneys paid over to the former owner or owners thereof, and a new certificate or certificates of the shares so sold shall be made out and delivered to the purchaser or purchasers thereof. 6. No shareholder shall be entitled to transfer or vote upon any share after any call shall have been made in respect thereof, until he or she shall have paid all calls for the time being due on every share held by him or them. 7. An annual meeting of the shareholders of the Company shall be held for the transaction of general business and the election of Directors; the time and place of meeting and the number of Directors to be regulated by bye law. 8. The principal office of the Company shall be in Sussex, in the County of King's, but the Company may establish agencies or branch offices in any part of New Brunswick. 9. The transmission of the interest in any shares of the capital stock in consequence of the marriage, death, bankruptcy or insolvency of a shareholder, or by any other lawful means than an ordinary transfer, shall be authenticated and made in such form, by such proof, with such formalities, and generally in such other manner as the Directors shall from time to time require, or by any bye law may direct. 10. The shareholders of the Company shall not as such be held responsible for any act, default or liability whatsoever of the Company, or for any engagement, claim, payment, loss, injury, transaction, matter or thing whatsoever relating to or connected with the Company, beyond the amount of their respective shares in the capital stock thereof. 11. The Directors may from time to time, with the consent of a majority of the shareholders present or represented in a special meeting called for that purpose, borrow money on behalf of the Company; and the Directors may, for that purpose, make or cause to be made bonds, or other instruments, under the common seal of the Company, for sums of not less than one hundred dollars each, which shall be a lien and charge on the stock and property of the said Company; provided that the aggregate of the sum or sums so borrowed shall not at any one time exceed one half of the amount of the paid up capital of the Company for the time being; and no lender shall be bound to enquire into the occasion of any such loan, or into the validity of any resolution authorizing the same, or the purpose for which such loan is wanted. 12. Unless fifty per cent of the

Royal Gazette - Nov. 12, 1842 We draw attention to the extracts from two Reports of Doctor Gesner on the Tobique and RestigoucheRivers, which he was deputed to explore, with a view to ascertain the capabilities of lands for settlement. To His Excellency Sir William MacBean George Colebrooke, K.H., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency, I beg leave to lay before Your Excellency a brief report on the explorations of the Tobique River. A more particular account of which will be contained in the report on the settlement lands. The Tobique River is the largest tributary of the St. John, excepting the Restcook, to which it is very nearly equal. Its mouth is twenty miles below the Grand Falls, and two miles below the confluence of the Restook with the main stream. The main Tobique extends to the northeast, and about a hundred miles from its mouth by the courses of the River, it is divided or forked into four branches. One of these branches enters from the southeast, and is supplied with water by three lakes, the largest of which is twelve miles in length. These lakes are situated at the chief sources of the main northwest Miramichi. The Indian portage between the St. John and Miramichi waters is only one mile in length. The other branches of the Tobique extend northward and meet the heads of the Nepisiguit and Upsalquitch, whose waters descend in an opposite direction to the Bay Chaleur. The Tobique, Miramichi, Nepisiguit and Upsalquitch Rivers, all take their rise in one district, and at the bases of the highest mountains in New Brunswick. Extending across the State of Maine in a northeasterly direction, there is a chain of high lands, occasionally elevated into mountains of considerable altitude. This branch is a part of the Allegheny chain, and embraces Cataadan and other mountains in the State of Maine. After entering New Brunswick, this branch sends up Mars Hill, Moose Mountain, and Bear Mountain, on the St. John, between Woodstock and the Grand Falls. The same range extends in a northeast direction to the heads of the before mentioned rivers, where some of the mountains exceed two thousand feet in height. This mountainous district gradually subsides as it approaches the Bay Chaleur, and the north coast of the Province is remarkably level. Another alpine ridge extends through the middle of the District of Gaspe, and separates the waters that flow into the St. Lawrence from those that fall into the Bay of Chaleur, and River St. John. The Tobique, Nepisiguit, and Upsalquitch, all take their rise in the broken and mountainous termination of the New Brunswick range; and after descending from fall to fall, they sweep through the vallies and receive the tributaries of the lower grounds, until they are lost in the larger streams into which they open. As the Tobique River and its tributaries are uninhabited, a sufficient stock of provisions was procured, and three Indians, with as many light bark canoes were hired for the expedition. Accompanied by my son, and Mr. James Millidge, the ascent of the river was commenced. We started from Fredericton on the 27th of June, and reached the mouth of the Tobique with the canoes, instruments and baggage, on the 3d of July. At the entrance to the river there is a considerable tract of intervale, which with several thousand acres of excellent upland belongs to the Melicete Indians. There is here an Indian village containing two hundred souls, and as this place is a depot for Timber, upwards of three hundred men were employed in preparing rafts of Timber to descend the main stream. As these Indians scarcely cultivate their lands, and their grant occupies a most important situation, it would be advantageous if some exchange could be made, whereby they would possess equal if not greater privileges. I am confident that if these valuable lands could be obtained by other inhabitants of the country, they would be immediately settled, and a flourishing town would soon be built upon the grounds now unprofitably occupied by the Aborigines. During the rafting of the Timber, many of the Indians are employed; but their chief occupation is hunting and fishing. We observed among them a quantity of Fur, taken from Ambrose Bear and his brother, valued at œ150, among it were eighty Beaver skins, and about thirty pounds of Castor. About a mile above the Indian Village there is a dangerous rapid called the Narrows. At this place the River to the distance of a mile passes through a gorge only one hundred and fifty feet wide, and between cliffs from fifty to one hundred and fifty in height. It is evident that at some former period there has been a great fall at this place, and their evidences that the barrier to the water has been broken, and the River above gradually lowered. The water rushes through the gorge with great violence, and the projecting masses of rock produce dangerous rapids. During the freshets of Spring and Autumn, this channel is too narrow to give vent to the river; and the water from being thus partially dammed up, overflows the shores above to the distance of two miles. At such periods boats and canoes cannot pass; and such was the violence of the rapids in July, that we were compelled to draw our canoes up with tow-lines. The navigation of the River at this place, might be rendered safe and easy, by the erection of dams and locks; there is here an excellent site for Mills which might be set up, without much injury to the salmon fishery. From the mouth of the river to the Red Rapids, a distance of twelve miles, there is some good intervale, the lands are high and the soil productive. Several squatters have settled on the banks of the stream. The Tobique Mill Company built a dam across the river, and erected extensive saw mills in 1837, but before these mills were put in operation, a part of the dam was carried away. The Mills have since been taken down with the intention of moving them to the Narrows below. œ27,000 were expended by the company at this place. Three millions of logs that had been cut, have also been lost in the speculation. The establishment is now a deserted village. If a dam should be built across this stream, a free passage for salmon and other kinds of fish should be secured, as there is scarcely a better river fishery in the Province. Our third encampment was at Plaster Island about twenty five miles from the St. John, and two miles above the mouth of the stream called by the lumbermen Wapske or Wapskehegan. Between the island and the Red Rapids, the Otelloch, Otella, three brooks, and other smaller rivulets enter the Tobique. The main River here is extremely beautiful, being decorated by numerous small islands and belts of intervale, covered with elms, balsamic poplars, and other trees characteristic of a most fertile soil. The Wapskehegan is a large stream coming in from the eastward. At its sources it approaches very nearly a branch of the Miramichi, and it runs through a fine tract of intervale and excellent upland. A mile below the Red Rapids, the calcareous shales of the St. John are overlaid by a bright red sandstone, a rock that always indicates a good soil. This sandstone occupies a large tract in this quarter, and extends up the River to the base of Blue Mountain, twenty miles farther northward. At Plaster Island, on the banks of theWapskehegan, and so far as we could discover in a district of several thousand acres, there is an abundance of excellent gypsum. At the Island on the left bank of the Tobique, the gypsum occurs interstratified with the red sandstone in a cliff 135 feet high. It is of the fibrous and compact varieties, and some of the strata are of a bright red color. This gypsum may be transported from the Wapskehegan down a branch of the southwest Miramichi, and supply the country in that quarter, as well as the valley of the St. John, with excellent mineral manure. A short distance above the head of the island,there is a small brook of brackish water, it proceedsfrom a salt spring, a mile and a half from the river. There are also other indications of rock salt in this quarter.About a mile farther up the stream I discovered an immense ridge of limestone, at the side of the River. This limestone is stalactital like that found in the interior of caves. Apparently the river at this place, has broken into a cave of considerable magnitude, and stalactites are scattered along the shore. From the deep fissures and chasms concealed beneath the fallen trees and other vegetable rubbish, it is dangerous to walk over this rock; there are many good reasons for believing that the earth is cavernous at this place. Above Plaster Island the river becomes very serpentine, and where the intervale is absent, the banks on each side are from fifty to a hundred feet high. About twelve miles above the mouth of the Wapskehegan, another large stream called the Agulquac, enters from the eastward; this stream also passes through a fine tract of country. A large area here was overrun with fire a few years ago. It is probable that this was the same conflagration that destroyed the towns and villages of Miramichi, in October, 1825, but as there are no inhabitants in this quarter, the exact period of its occurrence has not been ascertained. From the mouth of the Agulquac to the base of Blue Mountain, is about eleven miles, the River here is eighty yards wide, and is skirted with fine tracts of intervale. There are also numerous alluvial islands covered with lofty and thick foliage. At the foot of the Mountain the red sandstone reposes on the transition slates. The whole country from this mountain is comparatively level; but from this point northward, it assumes new features and becomes more elevated. About eighty miles from the mouth of the Tobique, the river divides into four branches. The Little Tobique, Mamozekee, and Right Hand Branch, extend to the source of the Nepisiguit, and wind their way among naked and almost inaccessible mountains of granite and trap rock. Bald Mountain is

2,240 feet high, and is surrounded by several lofty peaks, but little inferior in altitude. It was my intention to have visited all these mountains, but the streams had become too dry for our canoes, one of our Indians had deserted, and the two that remained, refused to proceed any further into the wilderness. Our provisions were reduced almost to the choice of fish caught in the stream, and our faces and limbs were swollen and painful from the innocent stings of the insects in the forest. The whole surface of the country in the direction of the Tobique River, from its mouth to the distance of eighty miles northward, is capable of the highest degree of cultivation. The soil in general is equal to, and often surpasses the best kinds I have seen in the Provinces. I had supposed, from the accounts received from persons who had been engaged in procuring timber up the stream, that there were many places where the soil was unfit for cultivation; but such an opinion has arisen from the dreary appearance of the surface, where it has been overrun with fires. In every quarter we found a deep, rich, and strong soil. Formerly there were immense groves of white and red pine in the vicinity of this stream, but most of these have been removed or destroyed by fires. At present there is comparatively but a small quantity of pine, spruce, cedar and sometimes beech, birch and maple. Along the whole course of the stream, there are tracts of the best quality of intervale, covered with elm and balsamic poplar, ash, alder, &c. Wild hay is abundant. Besides these, we found indigenous grape, wild plums, currents, gooseberries, mint, rhubarb, and onions, with all those plants which only flourish on the richest soils. In descending the river, I counted seventy islands, all composed of alluviums. The limestone, gypsum, and salt, are very valuable in this part of the Province, and they are so situated that they may be transported over a wide extent of Country at a trifling expense. The river abounds in salmon during the season, and there is always an abundant supply of trout and whitefish in its waters. John Cahile, who lives near the mouth of the river, killed twelve barrels of salmon with a single spear last season; they were sold for œ5 per barrel. The river is navigable for canoes and tow-boats about one hundred miles from its mouth. There is only a portage of two miles between its head waters, and the Nepisiguit, and one of three miles to the Upsalquitch. The lands upon the Tobique remain ungranted. Under a due consideration of all the advantages offered by the river and for the soil of the intervales and uplands, I am fully of the opinion that this tract of country, which embraces several millions of acres, is better adapted to the circumstances of respectable Emigrants and other settlers, than any other district I have seen in New Brunswick or Nova Scotia. Much confusion has arisen in the names of places within the Province from the careless manner in which these names have been written and spoken. A great number of rivers and lakes still retain in some degree, the ancient names of the Melicete and Micmac Indians; but those names in many instances have been changed or corrupted ao that they are not now understood by the Aborigine themselves; and they are seldom written in the same manner by the inhabitants of the Province. Other names are those of the early French settlers; these also have become imperfect, and even English names are sometimes written improperly on Maps or other public documents. I have taken the liberty to insert the names of places on the Tobique, as used by the inhabitants, and opposite to them the Indian names. Tobique Naa-cootke, Otelloch Hotelle, Otella Na-me-taaps-k-waac-sis, Mamozekel Epe-ce-tus-sis, Right Hand Branch Qua-quaps, Serpentine River Wa-ca-souis, Lake Quispaam, Trowsers Lake Nee-taa-waac-paac, Sisson Branch Wa-caa-so-nee, Little Tobique Caac-seo-sic-ka-wa-ic, Bald Mountain Es-coot-naak-a-witz, Three Brooks Naa-saa-taa-gan. The present brief report has

Daily Telegraph - Mar. 21, 1876 Gypsum for the Centennial. - Hopewell, LowerCape, A.C., March 20. - To the Editor of the

Daily Telegraph:- Sir, I saw a long list of articles for the Centennial Exhibition in Wednesday's Telegraph. I have a most excellent quality of gypsum, considered by competent judges to be the best gypsum in the Province, and if you could inform me who to send a specimen to the Centennial Exhibition I should be most happy to furnish a specimen, as I think all of our best articles ought to be exhibited there. I remain, Yours truly, William Blacker."

Chignecto Post - Dec. 6, 1877 Hopewell.- ...Quite a brisk business is being done at the Hill in the quarrying of plaster. Another firm is about, we believe, to open in the neighborhood of the former one and promises to do a large business

Chignecto Post - Dec. 13, 1877 The New Plaster Quarry, near the Manganese work sat Shepody Mountain, A.C., are turning out well. The earth covering is between 10 and 15 ft., but the article when reached is of very good quality and exists in abundance. Over 1,200 tons were shipped by Messrs. Bacon & McElmon this last season, and they intend next season to ship from 5,000 to 10,000 tons. The plaster is about three miles from a place of shipment on the Shepody River."

Daily Telegraph - Dec. 15, 1877 and Morning Freeman - Dec. 15, 1877 New Plaster Quarry. - The Sackville Post says that the new plaster quarry, near the Manganese works at Shepody Mountain, Albert County, is turning out well. The earth covering is between ten and fifteen feet, but the article, when reached, is of a very good quality and exists in abundance. Over 1,200 tons were shipped by Messrs. Bacon and McElman this season, and they intend next season to ship from 5,000 to 10,000 tons. The plaster is about three miles from a place of shipment on the Shepody River."

Daily Telegraph - Jun. 18, 1878 A Charge Against Mr. Rogers of Albert. - A reliable correspondent in Albert complains that a writer in the Moncton Times had caused $100 of public money to be expended in making a road to the marsh of Mr. James Rogers, the latter being an uncle of the M.P.P. Our correspondent says this is a gross misrepresentation. It seems due to Mr. Rogers to insert the following, as sent by our correspondent: The inhabitants in the neighborhood of Hopewell Hill, having no public road to a shipping place nearer than Riverside or the Cape, some ten miles from point to point, about thirty years ago, had a public road laid out from the Hill Corner to the Shepody River, where there is a good shipping place, the best at the head of the Bay; a small wharf and a very passable road was constructed by private subscription. This was added to from time to time by a few public grants; although always a bad road and a meagre wharf accommodations, it was a great benefit to the country, and was highly valued until the tidal wave of 1869 swept away the wharf and bridges when the road was abandoned. As a road to his marsh, James Rogers never dreamed of using it, simply because, in the first place he could not get to it by that road, without crossing the marsh of four other proprietors (which he would not be allowed to do); and in the second place, because he had a much better road of his own leading directly to his marsh. Last autumn Mr. C. Tompkins commenced working the plaster quarries near the hill, and wishing to get out a large quantity of plaster during the winter, and having no shipping place nearer than Riverside, he persuaded the people to have the old road opened again; active measures were taken, a grant procured, and the road opened in early winter. Mr. Tompkins was enabled by these means to keep a large number of men and teams employed all winter, and to have for shipment this spring some 8,000 tons of plaster to be added to our exports. And this is the result of Mr. Rogers' very wicked act according to the Times."

Daily Times - Feb. 8, 1879 Albert County. - Quite a brisk business is being done at Hopewell Hill in plaster, and a large number of men and horses are constantly employed in conveying it to the wharf. The enterprising proprietors, Messrs. Bacon, McAlmon and others, deserve great credit for the energy they have displayed in developing this important industry, and it is in contemplation to build a mill in which the raw material may be manufactured. The plaster is of the finest quality, and is said to be far superior to any found in the Maritime Provinces. The supply is practically inexhaustible, and the outlook for the company grows brighter. Heretofore a difficulty lay in their way in the shape of a lake of water, of some two acres, lying between the quarry and the road. By cutting a canal 500 feet long, 68 wide at the surface and 11 feet at the bottom, and averaging 38 feet deep, this difficulty has been removed, and free access has been secured. We suppose the next thing will either be a tramway or a branch railway. One or the other must be had at an early day, and the

Chignecto Post - Feb. 13, 1879 Hopewell.- ... Plaster work at the Hill, are being pushed forward with commendable energy, and give employment to a large number of men and teams."

Chignecto Post - Aug. 19, 1880 Plaster is mined here by Messrs. Bacon & McElmon, who ship between 7000 and 8000 tons of the white stone annually to the United States. The high duty prevents the manufacture of it for export..."

Moncton Daily Times - Feb. 6, 1880 Albert Co. - The Hopewell Hill Plaster Quarry, superintended by Mr. Robert Bacon, is turning out large quantities of plaster, this winter."

Daily News - Feb. 16, 1880 Matters in Albert. - We have to record a sad accident this week which resulted in the death of Mr. William Leavitt, son of the late Henry Leavitt, of St. John. It appears the deceased was engaged at some operations in the Hopewell Hill Plaster quarries, when a stone struck him on the head, resulting in death some few hours later. Mr. Leavitt was in his 21st year. Rev. George Love officiated at the funeral on Satyrday morning and accompanied the

S.J. Daily Sun - Apr. 21, 1892 Hopewell Hill, April 19. - The schr. Victory arrived at Red Beach last Friday with loss of foretopmast. Robert Newcomb, sparmaker, of this place, will have the new stick ready on her return here."

Codes: O3 / IDX_Names: Hopewell Gypsum;

S.J. Daily Sun - Dec. 9, 1892 Hopewell Hill. - Titus Steeves of Demoiselle Creek has sold all of his property at that place, except the buildings and a few acres of land, to Mr. Dimock of the plaster quarry, for $2,000. The property will be of much service in connection with the quarry's operations, which are beginning to assume very satisfactory proportions. The plaster exported this fall will be shipped from Gray's Island, Hillsboro, but it is thought probable by another season the Hill may be selected as the port of shipment, the public wharf at the mouth of the Shepody river having good advantages for such purpose, with rail communication to within half a mile of the quarry. The company have capital and push and intend to prosecute the work in good shape."

S.J. Daily Sun - Dec. 19, 1892 and Daily Times - Dec. 20, 1892 Hillsboro. - A vessel is expected here this week to load plaster for Messrs. Dimock & Co. She will receive her cargo at Gray's Island."

S.J. Daily Sun - Dec. 23, 1892 Hillsboro. - James Blight has brought by rail, a number of strong carts for use at the plaster quarry of Dimock & Co."

S.J. Daily Sun - Feb. 16, 1892 Hopewell Hill. - The plaster men have about 250 tons of plaster hauled from the quarry, which is located about three miles from here."

S.J. Daily Sun - May 4, 1892 Hopewell Hill. - The schooner Victory had her new foretopmast sent up at the Cape last week, on her return from Moncton."

Daily Times - Nov. 30, 1892 Hopewell Hill, Nov. 26 - Work has been resumed at the plaster quarry at Chemical road under the management of Chas. D. Shaw of that place."

Moncton Daily Times - Sep. 12, 1892 Hopewell Cape Plaster Quarry. - The plaster quarry at Hopewell Cape, sold by Henry J. Bennett to Windsor and New York parties, is being developed. The new company now have some twelve men employed and intend to ship several cargoes of plaster this fall. If the quarry turns out as well as expected it will prove an important industry on the Petitcodiac. The company is said to be a wealthy one will push the business."

S.J. Daily Sun - Apr. 21, 1894 Hopewell Hill. - The schooner Victory, Capt.Stiles, went on the berth at the public wharf here today and is loading rock plaster from Chemical road quarry for Red Beach, Me."

S.J. Daily Sun - Apr. 24, 1894 Hopewell Hill. - The Victory finished loading plaster today, and will sail tonight's tide."

S.J. Daily Sun - Mar. 25, 1895 Albert Co. - Hopewell Hill, March 18. - Capt. Albert Stiles, who recently discovered gypsum on his farm here, has sunk an eight foot shaft to some distance into the solid plaster rock, and has reasons to think the prospects good. From borings made at a distance of from fifty to one hundred rods in all directions, it is evident that the supply is practically inexhaustible. The plaster is found from five to thirteen feet from the surface. The situation is an excellent one in regard to shipment, the quarry being located within a few rods of the railway, and only a quarter of a mile from the Shepody Bay. It is claimed a face of sixty feet can be opened up before getting below a drainage level. Specimens have been sent to Boston and elsewhere to be tested. ...."

S.J. Daily Sun - Sep. 5, 1895 Hopewell Hill. - The indications are that the plaster quarries at Chemical Road, near this vicinity, will be reopened this winter."

S.J. Daily Sun - Sep. 16, 1895 and Moncton Daily Transcript - Sep. 20, 1895 and S.J. Gazette - Sep. 20, 1895 Hopewell Hill. - James Robertson of Albert Mines is conducting operations at Captain A. Stiles gypsum quarry at Hopewell. The shaft which was opened last spring is being drained, after which the work of excavation will be proceeded with and a face opened up. Mr. Robertson has no doubt that the plaster is present in almost illimitable quantities."

Codes: O3 / IDX_Names:Hopewell Gypsum;
S.J. Daily Sun - Jun. 13, 1899 Albert Co. - Americans May Operate a Plaster Mill. - Hopewell Hill, Albert Co., June 11. - There are indications that the plaster quarry which Capt. Albert Stiles opened up on his property here a couple of years ago, may be purchased and operated extensively by American parties, with whom the captain has been negotiating during his recent trip to New York. The samples shown the American gentlemen met with their highest approval, being of just the quality they were looking for, and they purpose sending an expert on right away to investigate as to the probable supply. In case of a satisfactory finding in this regard, a sale will probably be effected."

Moncton Daily Transcript, Page 2 - Wednesday, April 4, 1900 - ALBERT COUNTY NEWS - The plaster quarries at Chemical road have been worked considerably this winter and quite a large amount of plaster has been hauled to the public wharf for shipment."

S.J. Daily Sun - Jul. 18, 1900 Hopewell Hill, July 16. - The schr. G. Walter Scott is loading plaster at the Hill wharf for Red Beach, Me."

S.J. Daily Sun - Jun. 12, 1900 The schr. H.R. Emmerson, Capt. Christopher, is loading plaster at the Hill wharf for Red Beach, Me."

Albert County Journal, Page 3 - Friday, May 22, 1903 HOPEWELL HILL - At the plaster quarry at Woodworth Settlement, some very fine plaster is being gotten out."

Weekly Record - Fri., Apr. 15, 1904 Hopewell. - The gypsum quarry which has been closed down for over a month has not reopened."

Weekly Record - Fri., Feb. 5, 1904 Charles King, of the New England Adamant Co. of Boston, was in Hopewell Hill recently inspecting the plaster quarry the company is operating at that place. The quarry has been doing good work this winter, the output at times reaching a hundred tons a day. There are about 2,000 tons on the wharf. A landslide occurred a short time ago that will retard the work somewhat, as several hundred tons of earth will have to be removed. Mr. King is well satisfied with the progress made and with the future prospects of the work."

Semi-Weekly Sun - May 12, 1906 Hopewell Hill, N.B., May 7. - The New England Adamant Company, which has held an option on Captain Stiles' plaster quarry here for some time, and last fall got out some 500 tons, has purchased the property and will resume operations shortly. The company will have the plaster carried over the S. & H. railway, about one mile from the quarry to the company's wharf at the mouth of the Shepody river, and will put in sidings at the quarry and at

N.B. Courier - Sep. 23, 1837 LETTER II. To His Excellency Major General Sir John Harvey, K.C.H. and C.B., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May it please your excellency; Having in a former letter, and as briefly as possible, endeavored to give an account of the rocks of the Coal Measures on the west side of Chignecto Bay, and to notice some of their most important characters, I now proceed to the examination of the deposits in the direction of the main road leading from Cumberland to Saint John. There is an inconsiderable ridge of grey sandstone extending from Fort Cumberland in a northeast direction. Along the lower grounds at the base of this eminence it was proposed to open a canal, to communicate with the Bay De Verte; and certainly the situation is most favorable for that object, for advantage may perhaps be derived from a considerable lake, and as the country is low and level, there would be but few difficulties to encounter. Leaving the boundary line between Nova Scotia and New Brunswick southward, the road passes four miles over the great Tantamarre Marsh, one of the greatest collections of marine alluvium in North America. This alluvial deposit extends from several small lakes,situated some distance in the interior of the country, to the head of Cumberland Basin. It is fourteen miles long, and averages about four miles in breadth. Through it the Tantamarre winds its way to the sea, sweeping forward both on the ebb and flood tide the talus which can no longer find a resting place on the banks of a river brought to its narrowest limits by the constant accumulation thus conveyed. Already surcharged with disintegrated sandstone, the river in times of freshet, sends back to the sea the surplus sediment which is fast accumulating at its mouth, and will in time convert Cumberland Basin itself into an extensive marsh. Had the coasts of Chignecto Bay been formed of granite or any other crystalline rock, the present site of the great marsh of Sackville would have remained unobstructed, and now cease to extend its boundaries; but the yielding sandstone giving away before the action of the elements, has not only furnished the materials of the deposit already made, but continues its steady supplies for situations still remaining open, and ready to devour each particle of siliceous and argillaceous matter as it is carried along by the influx of the sea. Large rafts of timber have been buried in these marshes, trunks and branches of trees were often observed projecting from the bank at the bottom of the river - they have been discovered twenty feet below the surface - even the bones of wild animals have met this kind or interment, and large masses of rock having been transported by the ice, have fallen into the same common grave. All these, and perchance the works of art that may have been lodged in this wide receptacle, may a thousand years hence afford matter for grave speculation to those who will not consider the changes constantly going forward upon the earth. Great numbers of white wild geese formerly frequented these places, but they have long since disappeared, and but few of the grey variety now make them a resting place in the Spring. The alluvial deposits in this part of the country are extremely valuable. The inhabitants throw up dykes and embankments against the sea, and thus convert the soil formerly submersed by every high tide, into rich meadows; notwithstanding large tracts are in a sunken and neglected condition for the want of proper draining. The tide in Cumberland Basin rises about sixty feet at spring tides, therefore it is practicable to drain even the lowest lots, and the tide can be shut out by proper floodgates. The soil in the Parish of Sackville rests generally on new red sandstone. This rock reposes on the sandstone of the coal measures, and affords plentiful supplies to its numerous inhabitants. Westcok, the residence of Judge Botsford, has the appearance of an English manor. It overlooks the great marsh, and head of Cumberland Basin, and the beautiful villages scattered along the banks of its rivers. From the beds of clay interspersed near the surface, the country is well watered. There are also collections of sand and gravel. - The farms are small, and not remarkable for neatness, notwithstanding when viewed at a distance, and with the gentle eminences over which they are spread, they form a most pleasing landscape, and the small clusters of trees still remaining - affording shelter and shade to cattle and sheep - are instances of considerable foresight and taste. From Sackville to Dorchester, a distance of nine miles, the road passes over more elevated land; the grey sandstone of the coal measures often containing the impressions of leaves, and other vegetable remains, is predominant; and breaking out beneath the Court House of the latter village, forms a considerable declivity. At some places the rock is covered with a soft conglomerate and red sand, which afford a less fertile soil than the red marly rock of the lower lands. Dorchester and its river were formerly called Memramcook. The principal village stands on a slope, where several grist and saw mills are propelled by the brook descending towards the river. Looking southward, Shepody Mountains appear lifting their tops far above the rocks of the carboniferous order. Judging from their appearance at a distance they are composed of primary and transition formations; and probably like the Cobequid chain in Nova Scotia, (of which they may be said to form a part), they are the southern boundary of the vast coal district of the Province. The Memramcook river extends in a north direction until its ultimate branches meet those of the Shediac on the Straits of Northumberland. The marsh along its banks is twelve miles long, and embraces four thousand acres. The alluvium here is like that of the Tantamarre, having been derived from the same sources, and collected by the same causes. The upland farm lots all join the marsh, and are well cultivated, forming a broad band down each side of the river. From many points the view is delightful, and characteristic of the Acadian inhabitants, who still retain the French language, habits and costume. Four miles northward of the Court House, there is a bed of limestone interstratified with the sandstone. It would be an excellent auxilliary as a manure, were it applied, and is admirably adapted to the soil of the country, where it has been deposited. Having carefully examined the alluvium of the marshes already mentioned, they were found to contain a much greater quantity of silicious, and less argillaceous matter than those of Hants and King's Counties, in Nova Scotia. These circumstances are readily explained, when it is considered that the marshes of Westmorland are composed of pulverised grey sandstone, while those of the most fertile of the other province consist of disintegrated new red sandstone, which from its containing a greater quantity of marl produces more luxuriant crops. The deficiency of calcareous matter in the extensive marshes of Tantamarre and Memramcook, might however be readily supplied by the application of lime. There are numerous blocks of granite scattered on the surface of this country; from whence they came it is difficult to determine, when so little is known of the geology of the Province. It is most probable nevertheless that they have been exiled from the primary rocks forming the Shepody Mountains, by the force of water which has evidently submerged the country at some remote period in the earth's history. From the bridge over the Memramcook to the Petitcodiac, a distance of ten miles, the sandstones of the coal measures rise to the surface. Here, as in many other situations, the frost, rain, and vicissitudes of the weather, have produced a dilapidation of their strata, and a light sandy soil is mixed with the detritus formed under the more active operations of causes which have long since subsided. The soil thus formed, principally of silicious matter, is by no means productive, and instead of the sugar maple, beech, and yellow birch, the meagre white maple and spruce have here fixed their residence. A number of French families reside on the road, and as is usual with them their farms are small, and their dwellings humble. Arriving at the

Petitcodiac river from the eastward, a tolerable high ridge of land will be seen to the northward, and a chain of mountains extending from Shepody appear stretching away to the southward and westward; detached boulders of granite increase in number on approaching this large stream, and collections of fine yellow sand; and beds of clay, may be seen by the road side. This beautiful river, following a serpentine course in a north east direction, turns at almost a right angle at a place called the 'Bend of Petitcodiac', from thence it extends southwest until its branches meet the forked extremities of the Kennebecasis. At the angle thus formed, there is a considerable village, with an excellent landing place for timber, deals, and other productions of the fertile and well populated country in the neighborhood. At high water the scenery is very pleasing, and bears a resemblance to some of the splendid views on the Thames and Mersey, in England; but at low water its imposing effect is lost, and the empty chasm, with its muddy banks, have a disagreeable and gloomy aspect. In this river the tide runs with great rapidity, often opening new channels and sweeping away large collections of sand, and undermining the alluvium produced by its singular powers. So great is the distance over which it must pass in the space of a few hours, that its increasing volume on the flood, particularly at Spring tides, is greater than its speed over the gently inclined 'flats', hence it rolls forward in a foaming tidal wave, sometimes six feet high, sweeping the river with a rush of water like that of a coming deluge. - The effects of such powerful causes appear obvious, in the estuaries of Shepody Bay and Cumberland Basin, where the increasing collection of sand and shingle are undergoing pulverisation to fill more quiet situations with the sinking sediment. Large trees, pieces of timber, and quantities of vegetable matter, drifted from the marshes above, lie buried in these moving sands; wrecked vessels and boats also add to the materials covered in these fearful wastes, over which at high water the largest ships may pass in safety. I have not had the opportunity of measuring accurately the height of the tides in the Petitcodiac, but am of the opinion its highest limits will exceed seventy five feet. Large quantities of marsh on the river have been rescued by dyking, and now yield a plentiful supply of fodder for cattle. The new red sandstone at Sackville, extends in a southwest direction to the ""Bend"", where it is occupied by a number of farms, sloping down the higher grounds on the borders of the marshes to which they are attached. From the Bend of Petitcodiac to Nixon's Inn, a distance of 12 miles, the road extends along the north side of the river. The soil became sandy and light; instead of birch, beech and maple; larch, white and yellow pine inhabit the surface. I have observed that the pine always selects a loose sandy soil, which not only affords it a larger growth, but allows its roots to extend to great distances, thereby affording greater security in gales of wind. The more hardy spruce will 5 send its roots in the narrow crevices of rocks, and cling to a footing where other plants would fall before the breeze. The sand along this road lies directly on the rocks of the coal measures, and often forms collections of considerable depth. On a branch of the Petitcodiac called PollettRiver, and about six miles form the main road, there isan outcropping of coal, which has been intersected by theravine giving passage to that stream. The coal has beenemployed by a blacksmith in that neighborhood, and I regret that I was unable to devote sufficient time, and expense, to ascertain the probable quantity there deposited. I observed a quantity of the argillaceous oxide of iron (clay iron stone) not far from the coal, and it is probable that there is a sufficient quantity of those valuable minerals in the vicinity of this river, at least to support an iron foundry. But considerable time and labour would be required for their full discovery and development. The subsoil in this part of Westmorland is light and sandy, having been derived from the sandstone placed beneath. Blocks of granite, syenite, and porphyry, are common on the surface, and seem to increase in Frequency as the road diverges towards the mountainous land situated a few miles from the coast of the Bay of Fundy. Among the pines I observed a number of red bellied woodpeckers, the Picus Carolinus, a rare bird in Nova Scotia. They are covered with a beautiful plummage, but are very destructive to the groves of pine, as this kind of wood offers but a feeble resistance to the horny beaks of these industrious animals. Between Nixon's and Holstead's Inns, there are some good farms, and instead of the marshes formed by the influx of the sea, The Peticodiac passes through a band of intervale formed in the course of past ages by loose soil, and decayed vegetables, swept down by torrents of rain descending from the neighboring hills. Pursuing its course in a westerly direction, the new red sandstone, four miles northwards of Holstead's Inn, forms a long belt of rising ground called ""Butternut Ridge"", on which there are several new and flourishing settlements. The red marly rock at this place contains beds of limestone, gypsum and rock salt. Several springs take their rise, and send forth large quantities of water highly impregnated with the saliferous mineral. The importance of these deposits to agriculture should not be overlooked, and the design of the Creator of the Universe in supplying salt far from the briny waters of the ocean, and granting lime to enrich the soil are among the exalted acts of his allwise Providence. The limestone contains the remains of numerous shells belonging to the sea. These point out the relative age of the rock, and the peculiar circumstances of its original history. Most of the species of these moluscous animals are now extinct, and their nearest types are only found in 6

Chignecto Post - Jan. 31, 1878 Mineral Development in Albert Co.- Perhaps no part of Canada displays a more varied and richer exposure of mineral ores and earths than the little county of Albert. Convulsions of nature in the earlier ages of the earth's history have tossed up the strata in every direction, placing within the reach of man the hidden treasures of the earth. Our readers are familiar with the almost fabulous wealth yielded by the bituminous deposit known as Albertite; with the Albert shales, which, though unproductive at present, will probably form a source ofwealth in the future; with the plaster quarries, which, developed by Messrs. Tompkins, is the leading industry inthe county; with the building stone, manganese and marls,which are all more or less a source of wealth. To these minerals, Albert seemed destined to have two more important additions made through the exertions of Thomas McHenry, Esq. The upheaval of Shepody Mountain has disclosed, according to geologists, the sub-carboniferous formation, the oldest of stratified rocks except the Devonian Series. During the ages when the sub-carboniferous rocks were in process of formation, the following substances were also formed in their order, viz: (1) lime, or carbonate; (2) gypsum, or sulphate; (3) gypsiferous sandstone, (4) salt; (5) bitumen, (6) bituminous shales, (7) Albertite. All these substances, except salt, have been found in the valley of Demoiselle Creek. Mr. McHenry secured some time since a limestone area on the line of railway two miles below the mines, which, from the fact of being thrown up in cliffs, seemed to offer superior facilities for quarrying. Mr. McHenry proposes to have kilns constructed, a grinding mill erected (for which purpose there is a fine water power) and the manufacture of this article on a large scale commenced early next season. Mr. McHenry also proposes to develop a large bedof clay that exists near the Albert Mines on the property of Hugh Steeves, Esq. No. 1 fine clay is imported from England. New Jersey furnishes an inferior article. It is used in fire-bricks, pottery pipes, etc., in making articles to withstand heat. The Albert fire clay has been tested at Brantford, Ont., by Devos at St. John and by potters in New York. Their report is highly encouraging. The position of these properties - their easy accessibility from all parts of the Maritime Provinces - the easy facilities for transportation by land or water - the cheapness with which they can be developed, owing to the abundance of wood and to water power, render them particularly valuable. These mineral resources will not only furnish a traffic for the railway, but will develop a wealth many times the entire cost of the railway. Such resources are a justification for the large expenditure of Government money for railway purposes."

Daily Telegraph - Oct. 14, 1874 Albert County. - ... The masonry of the Culvert on Demoiselle Creek, which will be slightly altered in its course, is of the most substantial character, being comprised of large blocks of freestone from the quarry of the Hopewell Quarry Company in the vicinity, the smaller culverts we saw were constructed in like manner. Some of the masons have complained they had not received any pay for four months, and that they were neither able to get away nor pay their board. Plaster. - A short distance above the culvertover the Creek, and about half a mile from the post road, on the left, are enormous deposits of plaster which crops out in solid white cliffs of considerable height along the creek. Some of this plaster is said to be of very fine quality. A short branch line from the railroad will make it available. It is owned by various parties, some portion of the land belonging to the estate of the late Mr. Archibald and some to that of the estate of the late Mr. Howell. ... The hills on the right of this valley abound in free stone, the soil containing large quantities of red marl. Albert mines. - ... The entrance to the mines is up a pleasant ascending road and across a wooden bridge, leaving a row of houses on the right, succeeded by a large engine house and other buildings, above which rises the pit head frame of the new shaft which has lately been sunk at the eastern end of the vein. From this point the road takes a slight turn to the left, and on the summit of the hill, after passing the large general store of Messrs. Willett Bros., we get a view of the situation, which by no means presents the usual grimy appearance of a coal mining district. The place is, in fact, a sort of amphitheatre, hemmed in by wooded rising ground, and is intersected by a deep ravine, in which runs the tramway for the conveyance of the coal to Hillsboro'. On either side the road for a short distance beyond the store are miners houses, after which it runs along the ravine, which is bridged in several places, the most conspicuous object at its western extremity being a large group of irregular wood and stone buildings situated on the rising ground of its right bank, and surmounted by the covered top of a pithead frame and square brick chimney, which points out the principal shaft of the Albert mines. A lofty wooden bridge some sixty feet high runs out from the building, close to the coal shoots for loading the wagons over the track below, which at this point is a perfect net work of switches, for the purpose of depositing coal, a considerable quantity of which lies on the ground. This bridge is connected by an elbow with the opposite bank, where are the office, dwelling houses, stabling, and at a short distance under the hill, in a northwesterly direction, is the cookhouse. In connection with the principal shaft are the engine houses for hoisting and pumping, also a large joiner's and blacksmith's shop. A few hundred yards below this shaft is another dingy group of wooden buildings, also surmounted by the roof of a pit head frame, the smoke issuing beneath which denotes that it is now used as an open-cast shaft for the ventilation of the mine, though as there is still an engine house here, in case of emergency it could still be used for the purpose of hoisting. Almost opposite, across the ravine, and upon the rising ground of the opposite hill, is a very pretty church with a spire, standing out in relief against the autumn foliage of the woods. We have now given the principal features of the scene, and may fill in with miners houses, scattered on both sides of the ravine, vacant pieces of land covered with piles of cordwood, coal, or mining lumber, while here and there rusty iron ventilating shafts rise from the ground apparently without any object except the exhibition of their own ugliness. The Principal Shaft. - There is very little bustle to be seen above ground about the Albert Mines during the working hours, which are only eight, one shift working from 7 a.m. till 3 p.m., and the other from 3 p.m. till 11 p.m. A man or two may be seen standing near a building, but considering there are eighty men employed, one might almost suppose that the coal was extracted by machinery. Crossing the bridge to the principal shaft, we find a comfortable coal fire burning in a movable grate, beneath a spacious chimney. A man stands with his back to the fire, composedly watching the gliding of the wire ""tows"" or cables in and out of the neatly constructed wooden bins, which seems to indulge in the peculiarity of having no bottoms. By and bye a bell vibrates in the engine room at some distance, the ""tows"" slacken their speed, a length or iron chain makes its appearance, and then a square box of coal, which the man pulls on to the bank, wheels a short distance, runs up and attaches an empty one to the tow, which at a given signal rises in the other division. Now a gong, connected by a wire rope with the bottom of the pit, strikes a certain number of blows, indicating what the ascent tow is to be loaded with, long or short timber, tools, slabs, etc., and so on. The shaft is rectangular in form, divided into three compartments, only two of which are visible, the other being in the engine house under the pumping engine, and devoted to the purpose of draining the mine, being furnished with five force pumps at regular intervals, each forcing the water into a cistern above from which it is taken by its successor, the weight of the pump shafts being counteracted by ballast boxes. In the rear of the shaft an old man sits cleaning safety lamps, of which he seems blessed with a never ending supply, and beyond are the drums, on which the flat, oily wire tows are incessantly wound and unwound. Separated by a glass partition is the engine room, where a hundred horse power high pressure horizontal engine incessantly pants and wheezes, sending a ponderous iron bound wooden connecting rod through the wall to

the crank on the drums outside. The engineer stands at an iron frame with the reversing gear before him, his left hand on the ""cut-off"" and his feet on the brake, a weight ascending and descending in a slot showing the progress of the tows up and down the shaft. It is very easy in case of accident to stop a descent of the mine, but one instance occurred here 10 years ago, of a man being killed by being hoisted and jammed against the pulley. In the engine room is also a small donkey engine, used for turning a large lathe. In another building on the second story, at the end of a large room, is placed, on a raised platform, the pumping engine, known as a ""Bull engine"" from the name of the inventor. This engine is 400 horsepower, and probably the largest in the Dominion. The cylinder, which alone can be seen, is enclosed in a white hooped casing of brick, and the piston acts vertically directly on the pump shaft, which works the whole five pumps, covering a distance of 1,200 feet, the shaft itself being 1,162 feet deep. The valve gear works in an upright iron frame on the floor below, and is not operated by the engine, but by water, in connection with the pumps by an arrangement known as the ""cataract motion"" by which all jar is prevented. The action of this monarch of the mine is peculiar; after a certain interval of rest he seems to be suddenly seized with spasms, and his valves rattle and jerk, in an alarming manner, until he again sinks into lethargy. The diameter of the cylinder is 62 inches, with a ten feet stroke, raising 50 gallons at each stroke, and in case of necessity, at the rate of 10 strokes per minute, 500 gallons could be raised in that time. Less pumping is requisite in dry weather than wet, the water being principally from the surface, but in case of repairs there is sufficient lodgment room below to drain the mine in ordinary cases. The Principle shaft is about 17 ft by 5 ft. The shaft below, now used as an up-cast shaft, is situated on lower ground, and is 982 feet deep. The third shaft, about a quarter of a mile lower down to the east, is in process of being sunk, and has got down to a depth of 600 feet. Here, as we have already stated, a new engine house has been erected, spacious buildings also covering the pit head, and a large horse gin adjoining. The engine room is very spacious and furnished with a handsome pair of horizontal 40 horsepower engines, the connecting rods of which turn a cogged wheel working into a larger wheel fixed on the axis which carries the drums. The engines are by Messrs. Fleming & Sons, of St. John; the arrangement is compact and ample, being completely under the eye of the engineer, standing in the centre, besides being easily accessible. The boilers are on the basement story, though at present there is only one in place. The shaft here was sunk for the purpose of striking the eastern end of the vein, which was lost for some years by a ""fault"", and was, in fact, only recovered about a couple of months ago, though the works at the shaft were commenced last fall. Near this shaft a wooden air shaft has been constructed some 65 feet high for the purpose of ventilation. It is shortly intended to explore on the west, the workings hitherto being principally between the principal shaft and the new one, a distance of about a quarter of a mile. In this space there have been about 14 levels run though three are only used now. Although the course of the vein is easterly and westerly, it varies considerably from right to left, sometimes coinciding with the strata and sometimes not. Occasionally something like crude petroleum is found on the rocks, and possibly this may be the origin of albertite. Markets. - The market for the albertite is principally in Boston, where it is sold to the gas companies, and was also formerly sold to the Kerosene Works. It is worth about $23 per ton. It is very light, always breaks with a fine polished surface, and has the appearance of jet without its toughness and solidity. Miscellaneous. - The present resident manager of the mine is Mr. Blackar. There is a graded school here, with about 75 pupils, the teacher of the superior department being Mr. J.W. Bishop, the other being presided over by Miss Milton. The mines are also visited by Dr. Lewis once a week. The Union Church, though small, has a very agreeable interior, the walls being oil painted in stone work. At one end there is a gallery for the choir, and it is neatly pewed and painted throughout. The company some time ago offered to furnish a reading room for the use of the miners, but somehow or other the idea does not seem to have been fallen in with, although, perhaps in connection with a ""smoking room"" (an institution we have seen under the roofs of very select and ambitious literary clubs) the advantages of the reading room might come to be appreciated. The company have hitherto been very fortunate. For though there have been some serious fires in the mine, the loss of life from accident since the opening of the mines has been limited to three or four men. This probably arises from the extra care which is requisite in working the mine on account of the gaseous nature of the Albertite, nothing but

Codes: T5 / IDX_Names:Albert County Gypsum;

S.J. Daily Telegraph - Oct. 11, 1872 New Plaster Quarry. - J.D. Tompkins, Esq., is erecting a large plaster mill at Saw Mill Creek, Albert County. The site of the mill is about two miles from Hopewell Corner and the quarry is an excellent one. The works will, probably, be put in operation in May next, and will give employment to some fifty hands."

Chignecto Post - Aug. 21, 1879 Albert Items.- ... During the season about the usual shipments of rock plaster, stone and coal have been made, but a casual observer would be inclined to think the shipments of calcined plaster were considerably diminished..."

S.J. Daily Sun - Dec. 22, 1892 Hopewell Hill. - James Bray has found specimens of plaster near his place at Lower Cape which are of a superior quality, being something similar to the white plaster. Mr. Bray thinks there are thousands of tons in that vicinity."

S.J. Daily Sun - Jul. 14, 1892 Hopewell Hill. - Am American gentleman is now at the Hill inspecting the plaster quarry on the Chemical Road, which has lately been under the management of E.W. Lynds."

S.J. Daily Sun - Nov. 21, 1892 Hopewell Hill, Nov. 17. - Mr. Newton of Red Beach, Me., and a New York gentleman were at the Hill this week in connection with the plaster quarry at Chemical Road."

S.J. Daily Sun - Nov. 28, 1892 Hopewell Hill, Nov. 26. - Clarence Dimock, of Windsor, N.S., has been here for a day or two looking after his interests in the plaster quarry at Demoiselle Creek, where work is being pushed with energy under the direction of James Blight. A quantity of plaster is being piled by the S. & H. rail track ready for shipping. The soft roads hinders the hauling in some measure."

S.J. Daily Sun - Nov. 28, 1892 Hopewell Hill, Nov. 22. - The Dimock Plaster company at Demoiselle Creek have built a platform 100 feet in length near Wilson's station, on the Albert railway, and have already begun to haul plaster for

S.J. Daily Sun - Nov. 28, 1892 Hopewell Hill, Nov. 26. - Work has been resumed at the plaster quarry at Chemical road under the management of Chas. D. Shaw of that place."

S.J. Daily Sun - Feb. 20, 1893 Hopewell Hill. - Four or five plaster teams are continually hauling to the public wharf."

S.J. Daily Sun - Jun. 29, 1893 Hillsboro.- The plaster quarry at Demoiselle Creek, worked under the management of James Blight, is turning out a fine quality in moderately good quantities."

S.J. Daily Sun - May 3, 1893 Hopewell Hill. - The schooner Victory arrived atthe Cape on Friday from Red Beach, and will probably load at Hillsboro with barrel plaster for Boston."

S.J. Daily Sun - Feb. 9, 1894 Hopewell Hill. - The Dimock Plaster Co. are employing about 15 men this winter at their quarry at Demoiselle Creek. They will have about 5,000 tons ready for shipment when navigation opens."

Codes: X6 / GYP / HILL / IDX_Names:Tobique Gypsum; Gypsum; Grey Brook Gypsum;
S.J. Daily Sun - Jan. 11, 1895 Land Plaster ... In New Brunswick and Nova Scotia there are immense deposits of this land plaster, sometimes known as gypsum and chemically termed sulphate of lime, and it can be procured at what seem reasonable prices. I have been led to mention in this matter because I find that during the last four or five years large quantities of plaster have been carried from these provinces to the United States, even as far west as Wisconsin and used by stock raisers as absorbents and deodorizers about their yards and stables. ... The Hillsboro quarries, and now that theTobique Valley railway is constructed, the Tobique quarries are easily accessible and contain almost inexhaustible supplies. So if we farmers can save money by using land plaster we should know it. In this and all other practices let us prove all things and hold fast to that which is good. ... W.W. Hubbard, Burton Hill, Sunbury Co."

Codes: Y1 / GYP / LIME / E5 / IDX_Names:Salt Springs Salt; Gypsum; Lime - General; Sussex/ Plumwesweep Salt;
S.J. Daily Sun - Mar. 26, 1888 House of Assembly. - ... Mitchell committed abill further relating to Mines and Mining Leases. He said the bill proposed that carbonate of lime, sulphate of lime, or gypsum shall not be subject to any royalty to the crown. The second section proposed that the governor in council, upon being satisfied on the report of a mining engineer, geologist or other competent person, that there is a reasonable probability of discovering valuable mineral deposits in any part of the province by boring, sinking shaft or other methods of exploration, may on the recommendation of the surveyor general by order-in- council, authorize an expenditure out of the public moneys of a sum not exceeding $2,500 in any one year, in and of or for the purpose of prosecuting such boring, etc., and the surveyor general's annual report, shall contain full statement of exploration if any, the expenditure therefor, and all other such information. Another section of the bill gave the governor in council power to cancel mining leases when certain conditions were not complied with. Speaker Pugsley said he was glad to see the government making a move in this important matter. During the election in Kings his colleagues and himself had promised if elected to do what they could to aid in the development of the mining interests of the country. This bill was intended to advance the mining interests not only of Kings but of the whole province. That being so he had no doubt it would meet with general approval. It had been shown that Kings county was rich in manganese and salt deposits, and there were indications of coal there in paying quantities. With proper encouragement, mining in Kings county must be attended with good results. This bill does not propose to take away the rights of those interested in mining. Its effect will be to enable the surveyor general in proper cases to go to a certain expenditure with a view to assisting the mining industry. As he had said, the bill was a move in the right direction. Tweedie said the bill did not propose anything new. The province has had an experience in this direction before. They all remembered what the diamond borer had cost and that the deepest hole it ever bored was a hole in the provincial treasury. Under this bill $2,500 would be given to some county, Kings perhaps, for nothing. The section empowering the cancelling of leases was an improper one and he instanced cases where under it an injustice might be done.Attorney General Blair said it was possible the amount named would not be advantageously expended. The Government had thought it a duty to make the experiment of aiding in mining development, and, though the sumproposed was small, the result might be very satisfactory. If the salt deposits of Kings are as great and valuable as it is said they are their development would be an immense advantage to the whole of New Brunswick, and the amount of revenue to the province would be very handsome. The bill, however, did not intend to apply only to Kings, but to any other part of the province where there was reasonable evidence to warrant an expenditure by the surveyor general. Speaker Pugsley again referred to the salt deposits of Kings County. Valuable springs coming

direct from the rock have been discovered in different parts of the county. The brine from the Sussex and Upham springs contains salt of the purest character and farmers are willing to give twice as much for the salt from these springs as for Liverpool or Ontario salt. There is every evidence that these salt deposits exist over the whole area of the country from Sussex to Hammond River. If the salt rock can be discovered, its development would no doubt be attended with most satisfactory results, in which case the royalty of the province would be large. The salt deposits of Syracuse, N.Y., had given to that city a population of 50,000 and a royalty to the State of New York up to the present time of $5,000,000. There was no reason to suppose that with proper encouragement the salt mines of Kings County might not be equally valuable to that county and the whole province. Hanington said he wished the proposal to aid in the mining development of the province every success. He referred to the efforts of private individuals to develop the mines of Albert, and expressed the opinion that if properly worked the mines of New Brunswick would produce gratifying results. Heatherington said his bill reflected the highest credit upon the surveyor general. He would heartily support it, because it was intended to help the development of the mines in Queens and other counties in the province. ..."

Codes: Z1 / IDX_Names:Petitcodiac Gypsum;
Daily Telegraph - Nov. 28, 1864 We are requested to state that the meeting of the Petitcodiac Mining and Manufacturing Company, advertised in our columns for the 29th inst. at 12 o'clock, will be kept open on that day until after the arrival of the morning train from St. John, to afford stockholders resident here an opportunity of being present. [NOTE: Ad on 29th not found]"

Codes: Z1 / IDX_Names:Petitcodiac Gypsum;
Daily Telegraph - Apr. 30, 1875 The Plaster Works at Petitcodiac. - It has been about twelve years since the farmers first commenced using the plaster rock in this locality for a fertilizer. The plaster ground is called Rockland, about three miles from Petitcodiac Station. The farmers used to break the plaster up and haul it home, after which they would pound it fine (a very slow process) and scatter it on the land. A mill is now built in Rockland for the purpose of grinding the plaster and preparing it for use, and a steam engine is to be put in the mill. All the above works are under the sole control of Mr. Amasa Brown of Petitcodiac. The demand for this plaster as a fertilizer is exceedingly great. A number of men are all the time at work tending the teams, which are kept busy from daylight to dark. From 18 to 25 teams have been hauling away while the roads would admit of it. A great deal of plaster is shipped at Petitcodiac to meet the great demand in different parts of the world. Those who wish to improve their farms with little or no expense would do well to consider the merits of this fertilizer."

Chignecto Post - Sep. 14, 1876 Petitcodiac Items.- The plaster business of Petitcodiac is looking up. Messrs. Brown have shipped this year about 8000 barrels. The rock is situated about two miles from Petitcodiac. The calcining and grinding is done in rather a primitive manner, and perhaps if the business had the advantage of capital and improved machinery, it would become a leading industry."

S.J. Gazette - Jul. 15, 1895 New Plaster Quarry. - Rumor says a force of men will be put to work at once on the King plaster quarry near Geo. Carlisle's. A new opening is to be made in the hill near where Mr. Carlisle worked the property last winter, but some eight or ten feet lower the object being to determine the quality of the plaster. Their operations will be conducted on a much larger scale. This property is very conveniently situated for shipping its products, being about a half a mile from the Petitcodiac river with an easy grade."

S.J. Daily Sun - Jun. 10, 1895Kings Co. - Havelock, June 7. - The plaster from Petitcodiac quarry has been examined by a first-class analyst, who declared it to be of superior quality, and several offers have been made to the company by Canadian and American capitalists, who wish to purchase the quarry. The company have not decided to sell, but are very sanguine over the result of the analysis. A prominent speculator will be in Petitcodiac this week to examine the mine."

Moncton Daily Times - Jun. 15, 1895 and S.J. Daily Sun - Jun. 18, 1895 Mining Properties. - Mr. H.D. Selleck, of New York, is in the city negotiating with Mr. Matthew Lodge for the purchase of gypsum mining properties held by Mr. Lodge in Petitcodiac and Halifax County. It is proposed to operate these mines on a large scale, if the quantity is forthcoming, of which there appears to be no doubt. It is estimated that about 30,000 tons of gypsum a year will be shipped from Petitcodiac to the United States via Moncton, going by water from here."

Moncton Daily Transcript - May 31, 1895 The sale of a valuable gypsum property at or near Petitcodiac is reported, as negotiations between some parties in Moncton and some New York capitalists have been in progress for some time past. - Sussex Record."

Chignecto Post - Aug. 12, 1880 Business at Rockport.- Westmorland Olive Free Stone Quarry, at Cape Maringuin, promises to be a valuable property. The stone is easily worked, possesses a uniform texture, free from iron or pebbles, and has a clear olive color. One cargo only has been shipped to the United States, and it sold well. The stone used in the new Fredericton Post Office is from this quarry and is much admired. The owner, Mr. Peter Hagan, has had eight men at work all this season clearing off the earth surface, which is 18 feet thick. Mr. Hagan has been working at it three seasons. He has built a wharf 124 feet long, 18 feet wide, 16 feet high, which he intends to extend next year 40 feet. He will commence shipping stone next month, to Boston. James Stevenson, Esq., (late of Read, Stevenson & Co.) has shipped one cargo of grindstones, to Boston, has two more ready for shipment, and will probably ship two or three in addition.- Mr. Lemuel Tower is getting out a quantity of flagging for the Moncton Sugar Refinery.- Mr.James Karr has been working at the plaster rock for two years testing and clearing it and has now got out a cargo to be shipped to New York, for Messrs.

Moncton Daily Times - Jul. 16, 1886 Hillsboro. - Shipping of rock plaster has been more active so far this season than last season. Shipment of ground plaster about the same as last year, both by water to United States and per railway to Upper and Maritime Provinces. A large quantity is sent per rail to Quebec and Ontario. Plaster mills are running very steadily. ... Charles Cochrane has his leg badly smashed at Hopewell Hill last Tuesday afternoon. While drawing a load of stone from the Memel quarry the forward wheel came off and Mr. Cochran was thrown and the wagon passed over him, with the above results. Dr. W.J. Lewis attended him. Mr. Cochran was removed to his home at Demoiselle Creek. - Maple Leaf."

Moncton Daily Transcript - Sep. 22, 1891 A large quantity of mill stones, just arrived from the north of the province, are unloading at the public wharf for shipment to Hillsboro to the plaster works there."

S.J. Daily Sun - Apr. 16, 1901 Hopewell Hill, Apr. 14. - The steamer Bratsberg, the first of the plaster fleet, arrived at Hillsboro recently to load cargo for New York Alex Rogers has sold a hundred tons of freestone at Grindstone Island."

Codes: Z2 / HILL / A2 / J8 / IDX_Names:Sandstone, Building Stone, Monument Stone, etc.; Grey Brook Gypsum; Albert / Kings County Oil Shales; Albert Mines;

Morning Journal - Jul. 12, 1867 The Resources of Albert County. - ... The soil, being that of, the lower carboniferous rocks, is, of course, of the richest and most productive kind. How could it be otherwise with its marls, gypsum, limestone, and oil-bearing shales? On this point Professor Bailey, a most careful and accurate observer, says:- No other district in the Province, except where alluvial deposits prevail, will compare with that of the subcarboniferous rocks in fertility, and none, therefore offers so many facilities for settlement. ... Mining operations will lead to a large consumption of wood. The manufacture of plaster now, and of oil, sure ere long be undertaken, will consume very large quantities of wood in barrels. .Ship building ... The vessels once built may at once be laden with plaster, albertite, lumber, building or other stones and sent on their voyage. ... Of the mining and manufacturing of Albertite andplaster we have already spoken. As to the latter we needonly add that the supply of gypsum, the white cliffs of which are a marvel to behold, is practically inexhaustible. Part of them may be anhydrous, and therefore of less value than the hydrous gypsum, used for making plaster for building, but it will require ages to exhaust the supplies of the most valuable kind which invite the operations of the manufacturer. The same may be said of the freestone for building purposes. It is now being quarried in several places, and despite an adverse tariff, shipped at a profit to the United States. It is strange if it cannot also be advantageously shipped to the Provinces of Quebec and Ontario as well as the freestone of Ohio. The members of the House of Commons will have to see to these and other kindred matters by and bye, so far, at least, as fiscal arrangements are concerned. Slate, flagging fire-clay, clay and sand forbrick making, may be had in abundance. Manganese and copper have been found, but the search for them and other minerals in quantities sufficient to warrant mining operations which has been carried on at an immense expenditure, has not as yet yielded any proper return. Wemay say the same of the oil bearing shales. The Caledonia works, their grinding apparatus, rotary retorts, distilling, condensing and purifying apparatus and machinery, their steam engine, even their anvils, hammers and other tools and implements, provided at a cost of hundreds of thousands of dollars, are lying idle and wasting away by corrosion. The shales yielding from 25 to 60 gallons of oil per ton, found on the Caledonia property (partly owned by Mr. Archibald,) and at Turtle Creek, in which he has an exclusive interest, are found from a foot to ten or twelve feet thick, increasing in richness and in thickness as they descend. The quantity of shales to be found far above the level of the sea is practically inexhaustible. At Baltimore nine different beds, lying parallel to each other may be most distinctly traced. At Turtle Creek there are five or six smaller ones, the one rising above the other, and even ascending the hillsides during a portion of their course. Quantities of the shale are now being shipped to the United States from Westmorland, where the same deposits are found, and it is probable that the day is not far distant when the price of oil, owing to the failure of the springs of petroleum, and the adoption of fiscal arrangements fitted to stimulate those branches of our industry which have been prejudiced by the refusal of Reciprocity on the part of the United States, may ensure the manufacture of oil from these shales, to such an extent, as will turn Albert into one vast manufacturing hive, and require her shipping in order to meet our export requirements, which will involve corresponding imports, and give the Albert Branch Railroad - we must yet say something more special in regard to this desirable work - and also the Intercolonial railroad a handsome contribution in traffic. When this comes about we suppose Mr. Archibald, who has already several miles of excellent road in Albert, and had several houses erected, preparatory to operations in which he hopes to engage, and about which Mr. McHenry ever thinks and talks by day and dreams by night (if not by day!) the owners of Caledonia stock, and sundry other persons, will have become immensely rich; while the farmers of Albert will have such a demand for their products, and mechanics and labourers such a demand for their work, as has been hither to unknown in New Brunswick. So may it be. We think, indeed, that it is quite likely that such will be the case, and as a means to this end, we hope the press in different parts of our Dominion will not grudge to say a word about the great general resources and the boundless mineral wealth of Albert County. Provincial apathy forced the Albert Mines into the hands of non-resident proprietors, with a single exception. Is this also to be the fate of the rich cannelite of Albert, representing millions upon millions of gallons of oil, or still worse is it to be neglected altogether, merely to nourish the ""forest primeval"" or to promote the luxuriance of the crops grown by the farmers of Albert?"

N.B. Reporter - May 14, 1858 and Carleton Sentinel - May 15, 1858 EXPORTS OF NEW BRUNSWICK ...in year 1857 ... The quantity of coal exported from the Colony was 5,056 chaldrons, nearly all from the Albert Mines. The quantity of Stone, including Building and Grindstone, exported, was 8,124 tons, a large portion of which was building stone, from the Albert Quarries. The quantity of Gypsum and Plaster exported was 7,888 tons, value, £1,637 sterling;... Pig Iron, 1,508 tons value £9,607, nearly all of which was the production of Nova Scotia. - Courier."

S. J. Daily Globe - Oct. 6, 1862 Albert County. - The ""Review"" referring to the prospects of Albert County says:- The Albert Coal is to a great extent dependent upon the American market, and also our Plaster and Gypsum; consequently, these branches of industry have not been carried on to the same extent that they would have been had our neighbors been fortunate enough to escape their present trouble. Our Stone quarries have also met a severe check to their progress. Not withstanding all this, these branches of industry have been kept in operation, and although there was some fears a short time since of the Albert Mines suspending operations for a time, yet these doubts and fears have been removed by an increasing demand for coal. Similar fears were entertained in reference to the Plaster Works, but they are still going on with their accustomedactivity. On the whole we are better off than we expected to be under the circumstance, for quite a change has taken place in this country during the past few weeks, and many of those doubts and fears that arise in the human mind at the thought of ""hard times"", have been removed, at least for a time."

Morning Freeman - Nov. 28, 1863 The Eastern Advocate describing the state of affairs in Albert county, says:- ""But the 'lords of creation' may be mining. Letus see. We go to the Albert mines - it is a Yankee company; the Albert County people have no interest there, except to pick up the crumbs that fall from the rich concern's table - the natives supply some of the produce that is consumed there - that is all! We go to the Plaster Quarries - it, too, is Yankee; and we have the same story to tell. The Stone quarries - the new discoveries - everything - is dependent upon Yankee enterprise and capital for development, and ""own fools"" are quite content if they can but sell these 'Yankees' a few goods, and supply them a small amount of produce, and so gather from their expenditure a few shillings! ""As to Mills and Manufactories we have next to none; of those which do exist we will take note, and give due credit at another time. Of Shipbuilding we have spoken in a previous number. ""The sum of the matter is this: that next to the attractive facilities lying idle on all hands which strike the stranger's attention is the easy, independent, want-of-enterprise air, which the people to a great extent exhibit in all the more settled districts of the county. They are comfortable, frugal, moderately industrious, and they are content."""

S.J. Daily Sun - Mar. 1, 1889 Hopewell. - ... (The Rocks) - The cape is best known to sailors as a conspicuous point on the coast during several hour's sail, and ashore for its interesting scenery. Though not as grand as the Giant's Causeway, Fingal's Cave, or the Palisades, yet it is easy of access, well worth seeing, and adds materially to the pleasures of a summer holiday. It is on the west side of the bay mentioned, has a water front near to low water mark of about one quarter of a mile, with a height of 100 or 150 feet. The south end is bold, the north end forming a gentle slope to low ground. This point is reached by a carriage road, and here an array of water worn columns of rock 20 to 30 feet high above a smooth, sloping beach, met the eye while the shore wall is seen to be honeycombed with caverns. Farther down shore past projecting reefs and recurring recesses, as the headland rises, the outstanding masses grow more lofty andimposing, occasionally approaching the height of themainland, with a diameter of 30 to 50 feet. Some areapparently solid and several rods away from the bluff,others parted off by a fissure a few feet wide and rifted from top to bottom, with their bases riddled by long oval shaped passages which here and there almost undermine a towering and ponderous slab. The tunnels, galleries and caves differ in size, shape and form. Here is one roomy as Dan O'Connell's acts of parliament; the next with scarcely standing room, while another has 20 feet of space between its floor of sand and pointed arch overhead. They run parallel to each other at times, or cross at right angles. Some go straight through from daylight to daylight, others by turns and surprises, or now and then end in the cliffs too far and too dark to be explored without a light. The rock at these peculiar places is chiefly a fine grained, tough, dull red, conglomerate, alternating with other layers of red sandstone, and coarser conglomerate, all containing a proportion of lime, which appears to be the cementing ingredient between the layers as well. It pounds up more readily than it splits or breaks and is an unwilling stone to give up specimens. Probably it was formed without flaws, but irregular lines of cleavage now run up and down through it at varying distances apart. These cracks have evidently marked out the isolated portions and located the caverns. Atmospheric agencies, the surf, and the beach pebbles, burrowing in the crevices have done the rest. No caves a mile long and necessarily earlier formed, of which written descriptions and traditions tell, could be found. Fractures similar to these would reasonably account for the remarked absence of living springs over a considerable area of neighboring country. Down shore at the southeast corner two regular wall like ledges of blue limestone reach under the tide and in shore rise in a precipice. Here a pile of large square blocks have ground upon each other showing the marks of the waves' tremendous force. This is the most enduring stone of the group and contains curiously worn arabesque pieces, with veins resembling bunches of grapes. The Cape rocks seem to be older than the fossil marked sandstones at St. Mary's Point and Hopewell Cape, on either hand, on the same shore, but widely separated. ... Close by Cape Demoiselle Creek empties into the bay. This stream gives its name to the country through which it flows. One branch takes its rise near the once famous Albert mine. Large deposits of gypsum, freestone and limestone, with indications of salt are found along its course; freestone and lime stone have been extensively quarried. These facts, with the name as a connecting link, seem to call reference to them. .... Though prospecting to any extent for albertite has ceased, and in view of an estimated expenditure of $100,000 by several American companies in trial pits and borings outside Albert mines limits, yet there is a lingering and quite general hope that the lustrous mineral will crop out at some unexpected place and time."

S.J. Daily Sun - Nov. 9, 1893 Albert Co. - Hopewell Hill, Nov. 6. - Several teams are engaged in hauling plaster from the quarry to the wharf at the Hill. The schooner Victory will carry another cargo to Red Beach, Me. The bridges on the public road to the wharf, across the marsh, are in bad condition, as are also the approaches to the wharf. Some years ago the road was put into excellent condition by Mr. Snow of Boston, who was then manager of the freestone quarry here, at a great expense, the whole length of the road, over a mile, being laid with cross poles covered with gravel. Since the suspension of operations at the quarry, however, the road has got into a bad state of repair. It would be to the interest of marsh owners and plaster men to make some repairs."

Colonial Farmer. - Jul. 17, 1871 Geological Report. - Continued. VI. Tobique Valley and Tributaries. In the course of my explorations of last season, I undertook an excursion up the river Tobique and one of its most important branches, the Serpentine, partly with the view of making an examination of the great Lower Carboniferous outlier there, and partly to visit certain lands which had been leased from Government on the latterstream for gold mining purposes. The Tobique is a large tributary of the St. John, falling into the main stream about fifty miles above Woodstock, from the northeast, its general course thus coinciding with the strike of the rocks in the high lands constituting the water-shed between the St. John and the Gulf of St. Lawrence; one of its main branches, called the little Tobique, or Left-hand branch, with a general south-easterly course, connects by a short portage with the Nepisiguit flowing, into the Bay of Chaleurs; while the other or Right-hand Branch, falling into the main 6 river at the same point but from the opposite direction, through a very rugged mountainous country, is, in its turn, composed of two branches, the Campbell and Serpentine rivers. These streams form a junction at the distance of ten miles from the main forks, from which point the Tobique flows through a rich and fertile valley in a southwesterly direction to join the St. John river, a distance of sixty-two miles, following the windings of the stream. On the Serpentine, which had not previously, so far as I am aware, been visited by any one with the special view of ascertaining its geological features, the land leased for mining purposes commences about three miles from its junction with the Campbell River, and extends some twenty miles higher, the stream for the greater part of the distance cutting across the strike of the rocks; but owing to the extreme difficulty of exploring this region, I was compelled to content myself with penetrating about seven miles from the commencement of the leased lands, or twenty miles from the main forks of the Tobique. The main Tobique, for about two miles from its junction with the St. John, flows with great rapidity through a deep, rocky gorge ..?.. coinciding with that of the slates, which dip N 70 deg. W <60 deg.; they are here highly calcareous, and enclose many seams and bunches of pure calcspar. Half a mile higher a narrow band of red and green slate occurs, associated with a tolerable pure compact or massive limestone, containing fossils, apparently in considerable profusion, although only visible on weathered surfaces. Among them, according to Mr. Billings, are Favosites Gothlandia, Atrypa reticularia, and Strephomena perplana, belonging to the Upper Silurian series. Above this the river assumes a course nearly at right angles to the strike, cutting sparingly calcareous but highly ferruginous and contorted brown weathering slate and quartzite, which must underlie those formerly referred to as prevailing at the mouth ofthe river. Small straggling strings of galena were observed at one place filling cracks in the rock, but are of no economic importance, except as indicated the metalliferous character of these rocks. At three and a half miles from the mouth, measured in a straight line on the strike, the soil assumes a red tint from the proximity of the red conglomerate of the outlier; a small patch of which is visible in the bank here, but is again succeeded by the older rocks, till reaching Red Rapids, four and a half miles up, where this formation; apparently identical in character with that mentioned in other parts of this report as the lowest rock in the Carboniferous series; appears in force in the bed and banks of the river, dipping due E. <4 deg., extending over half a mile farther up stream, and forming a steep, rocky channel. About this point the rock exposures are few, and 7 or a distance of nine and a half miles indicate no change, except in the prevalence of finer red calcareo-arenaceous sediments in ascending. - Then, about half a mile below the Wapskehegan, appear red and grey, and green marls, interstratified with blue limestone, all in thin alternating bands, still dipping slightly SE., and extending to the mouth of that tributary; a little above which the limestone re-appears in more massive beds, some being thirty inches thick, interstratified, as before, with red shales or marl, also of greater volume. This is a distance, in a straight line, of fourteen and a half miles from the mouth of the river, and here the outlier attains its greatest breadth, of about nine miles, of which by far the greatest proportion lies on the southeast side of the river. The general character of the limestone of the Tobique outlier is fine-grained, with conchoidal fracture, mottled red and pink and green, but sometimes bluish-grey; frequently lined with calcareous spar, and containing, according to Professors Hind's analysis, 82.6 per cent. of carbonate of lime. Superimposed upon the limestone and marl bedshere, are heavy beds of gypsum, which first appears at the mouth of the Wapskehegan, but in much greater development at Plaster Cliff, a mile and a quarter higher; where, for a distance of 80 or 100 yards, they rise perpendicularly from the left bank to the height of 120 feet. The great body of the rock is an impure, massive but earthy and exfoliating red and greenish gypsum, containing a varying proportion of carbonate of lime and silicious matter; but it is seamed with layers of pure white gypsum and of fibrous selenite, containing, according to the analysis of the late Dr. Robb, 77.7 per cent of sulphate, and 3.0 per cent of carbonate of lime. Nodules of nearly pure carbonate of lime are occasionally met with, imbedded in red gypsum. The whole appears to dip SE at a very low angle, and to be of limited extent, where it abuts upon the river; but I am informed, on competent authority, that the plaster beds are traceable at least four miles up the Wapskehegan, alternating with the other rocks of the series. Two small brooks were observed flowing into the river near the junction of the gypsum and marl beds, the waters of which were decidedlysaline and brackish; this character being, doubtless, derived from salt springs, which however, were not met with. Above Plaster Cliff, for a distance of eight miles, the strata, which are now horizontal, consist, as before, or grey and red sandstone and conglomerate, blue, red and green limestone, and marl; thereafter, at the point indicated, near Phillip's Brook, promontories and low knobs of dark brown amygdaloidal trap appear at intervals among the red rocks on the left bank, becoming more numerous and extensive in ascending the river. The red rocks, however, continue to occupy exclusively the 8 ed and right bank of the river, and occasionally also appear on the left bank, but now with westerly dip, until a point thirty-one and a half miles from the mouth is reached, where the outlier may be said to terminate; although for the last three miles of this distance, or from Blue Mountain upwards, only slight traces of its existence can be detected in the red color of the rocks in the bed of the river, where they are at rare intervals seen in place. Thus the total length of the outlier, measured in a straight line, may be stated at twenty-seven miles; it is of rudely elliptical form, and its total area is not less than 100 square miles. It is bounded on all sides by ferruginous and generally non-calcareous slates and quartzite, its outlines forming a very marked topographical feature, being defined by lofty ridges of the older rocks. A comparison of the rocks of the outlier, both in respect to their mineral character and apparent order of sequence, leaves little room to doubt that they belong to the same series which I have described as laying at the base of the main Carboniferous area of the

S.J. Daily Telegraph - Feb. 9, 1872 In Praise of the Valley of the Tobique. -... From its mouth to its source it presents unusual facilities for agricultural, lumbering and mining operations. The soil being impregnated with plaster, and of a rich loam, is inexhaustible. Well authenticatedcases of successive harvests on the same soil without manure are well known, and still it is so rich that the crops last year were beyond the average. ... Of its great mineral wealth little as yet has been developed, except Plaster of Paris, of which large quantities, ground and in the rock, are every year exported, chiefly to the State of Maine, where thefarmers realize its full value. But of the other minerals there is no lack. Iron, lime, antimony and gold have been found. Gold, in dust and grains, has often been found; but where its source is, that is the question. I have before me a fragment of waterworn pebble, from which the yellow metal gleams in its virgin purity. None of your fool's gold, but the soft, rich, shining metal, which can be cut with a pen-knife or hammered flat, and such specimens are not rare, and could the silent stone reveal its birthplace or retrace its watery path, it would reveal a richness which would vie with some of the far-famed diggings of Australia or California, for practical miners have estimated its worth at $1600 per ton, in the forms in which it has been found. I will not trespass further on your space; but if again able, I will write again and give more particular information respecting this magnificent section of our Province. W."

St. Croix Courier - Mar. 23, 1876 The Centennial. - Woodstock is to be represented at the Philadelphia Centennial, although not so large anentry as we could desire. The entries from this place are as follows: Iron Ore. Chas. Jackson, clay, sand bricks and drain tiles ...From Victoria County, the Tobique Gypsum Company send specimens of Gypsum and Syenite."

Daily Telegraph - Sep. 11, 1876... The rain being over, we again start on our journey up, and soon come to the Plaster Rock. I will give it a slight description. Looking from one side of the river to the other the change is wonderful - the high, red perpendicular cliffs of plaster on the one side rising abruptly to a heighth of 100 feet, and on the other a long intervale stretches off in the distance. This plaster has no superior, and would be a profitable investment if worked, provided a means of shipment could be effected. It is now taken down to Tobique, and worked on a small scale at Three Brooks. There is nothing in particular to note from this point up ..."

Royal Gazette - Jul. 11, 1877 Notice. The annual meeting of the Tobique Gypsum Company will be held at the Company's Office, at Three Brooks, Parish of Gordon, County of Victoria, on Monday the sixteenth day of July instant, at ten o'clock in the forenoon. By Order, John Edgar, Sec'y. Three Brooks, Tobique, July 2nd, 1877"

Carleton Sentenil - Mar. 15, 1879 Andover. - A number of men with teams are engaged hauling plaster from Tobique to Fort Fairfield; there has been more hauled this winter than in any previous year. About ten to fifteen teams pass through here each day."

S.J. Daily Telegraph - Aug. 2, 1879 The Tobique Gypsum. - Farmers on the St. John river, as far down as York and below that county, who have tried this plaster, have found that it is a most valuable fertilizer. On application of one hundred pounds to the acre has done well for grass. The use of it for cereals and root crops has proved very satisfactory. The supply is all but inexhaustible and the expense of procuring it quite moderate. It is worthy of the particular attention of

Carleton Sentenil - Oct. 4, 1879 Tobique. - A new plaster mill. - The demand for plaster being so great, preliminary steps have been taken towards the erection of a mill, on the Quaker Brook, for grinding plaster. It will probably be in operation in time to help to supply the winter demand which, if equal to last winter's will be very great."

S.J. Daily Telegraph - Jan. 26, 1880 Tobique. - Plaster Mill. - The new plaster mill on Quaker Brook lately started operations. This excellent fertilizer is drawn 26 miles from Plaster Rock to the mill where it is ground and barrelled for exportation. We are informed that the mill is owned by Messrs. Murchie & Richey, of St. Stephen. Mr. Stewart of Victoria county has charge of the mill st present."

Carleton Sentenil - Feb. 14, 1880 Tobique. - The Plaster Trade. - In consequence of a defect in a mill dam at Quaker Brook, Mr. Stewart has not yet started his new plaster mill. This will be a loss to Mr. S.; he hopes to have his mill running next month. Since the heavy snow storm on the 3rd. inst., there has not been much doing in the plaster business. This trade will doubtless be renewed with increased activity as soon as roads are well broken."

Carleton Sentenil - Mar. 27, 1880 Plaster. - Mr. Stewart has his new plaster mill on the Quaker Brook running, thus helping to supply the demand for this valuable fertilizer. There is a great rush in the plaster trade just now."

Daily Telegraph - Jul. 5, 1880 Andover, July 1. - Victoria Co.'s Progress ..... one new plaster mill .... Mr. Stewart's plaster and shingle mill at Quaker Brook on the left of the Tobique, six miles from Andover......"

Carleton Sentinel, Aug. 28, 1880 Quaker Brook Mills. - Mr. Stewart has put up a shingle machine in connection with his plaster mill, on the Quaker Brook; this shingle mill is now in operation. R.O."

Daily Telegraph - Nov. 25, 1880 Plaster Rock. - Messrs. Edgar Brothers, of Three Brooks, have made extensive preparations for mining this valuable fertilizer this fall. The demand for it is constantly increasing, and although they intend to grind 200 tons this winter, they do not expect to have enough to supply all the orders they are daily receiving."

S.J. Daily Telegraph - Mar. 18, 1881 Plaster. - The demand for this invaluable fertilizer becomes greater every year. This spring between 300 and 400 tons have already been hauled to Aroostook county by the Maine farmers, and probably more that has been purchased for use in Carleton and Victoria counties. On one day last week no fewer than 75 tons from down river went by Andover on their way to the plaster mills on the Tobique."

Carleton Sentinel - Apr. 21, 1883 Arthurette. - At Quaker Brook. Mr. Stewart is about to add steam power to his plaster mill, also to put up a rotary saw."

Codes: X6 / IDX_Names: Tobique Gypsum;
S.J. Daily News - Mar. 29, 1884 Tobique. - The quantity of plaster hauled from here this season has not equalled that of last season. One reason for this is that the Maine farmers, who are extensive purchasers of the rock, do not intend, this year, to raise so many potatoes, on account of the low prices that are ruling the markets."

Codes: X6 / O7 / SPRI / IDX_Names: Tobique Gypsum; Salt/Potash - Sussex Area; Mineral Springs;
S.J. Daily Sun - Nov. 11, 1884 Up the River. - From St. John to the Tobique, thence to Bathurst. - .... The First Settler on the river (Tobique) was Edward Campbell ..... Mrs. Giberson, the daughter of Mr. Campbell, ...I was shown a very fine piece of quartz, containinggold, which was found in one of the streams flowing into the Tobique....... We soon came in view of the PlasterRocks - a curious formation - looking like red sandstone with white streaks running through it horizontally, and so soft that it can be cut with a knife, without injuring the edge. It resembles very closely the meat of the cocoanut in color and texture. People come from Fort Fairfield in Maine during the winter and pay one dollar for a two horse load, one dollar and a half for a three horse load, &c., and sometimes as many as thirty or forty teams are hauling in one day. It is used for manuring the land and is excellent for a grass crop where the land is worn out. Edgar Bros. at Three Brooks, six miles below, own the plaster rocks and grind them at their mills. They sell the ground plaster for thirty cents a bushel to the farmers. I obtained some beautiful specimens of the rock nut lost them during my trip across the country. The formation isa wonderful freak of nature, and looked at from the water, the rocks assume curious and fantastic shapes. One piece of rock, standing out from the rest, resembles very closely a lion's head, from which likeness it takes its name. It is about seventy five feet high. A few rods up the river, are two springs, issuing from a rock and used by the Indians for medicinal purposes. One of the springshas a saline taste and was called by the Indians Salt Spring. In the olden times, the Indians made pilgrimages to the springs to be cured of all the ills that flesh is heir to. ...."

Codes: X6 / IDX_Names: Tobique Gypsum;
Daily Telegraph - Jan. 27, 1886 Mr. Ed. Whitney, of Waterville, has imported 500tons of Nova Scotia plaster rock this winter by rail to Woodstock. He is having it hauled to his mill at Waterville to be ground up ready for fertilizing purposes in the spring. Large quantities of plaster are imported into this country every year and this suggests the question whether or not the extensive deposits of valuable plaster in the Tobique could not be worked successfully. When the Tobique river railway is built in all probability the plaster mines there will supply the demand of a large part of the western counties with

Codes: X6 / IDX_Names: Tobique Gypsum;
S.J. Globe - Feb. 10, 1886 The Tobique Valley. - ... [Written for the Globe] ... Not much is known of its mineral wealth, but the existence of the celebrated Plaster Rock upon the Tobique is of itself a feature of great interest. This valuable fertilizer, which possesses a peculiar power of enabling plants to take in nitrogen, is much sought after. It is largely used in Maine and some parts of New Brunswick, and, it is said, could if the deposit were connected by rail with the N.B. Railway, be profitably exported as far south as western New York where plaster is in great demand. The products of our northern farms find a ready market to the south of us, and if under some wise policy an agricultural population similar to that of Aroostook, Maine, could be induced to settle upon our great fertile belt, the surplus of their farms would furnish an

important branch of export in the event of our obtaining better trade relations with the United States and West Indies. Surely we have here a field wide enough, and promising results great enough to be worthy of the attention of your public men and your representative institutions. You, sir, I know can speak from personal observation as to the promising character of the Tobique Valley, and can say whether you would not regard the settlement of those broad, vacant intervales and magnificent woodlands ... One of the most striking features of the Tobique is the Plaster Rock (Ok-ke-ok), which comes to the river about 25 miles from the St. John in a very picturesque cliff some three or four hundred yards long and about 125 feet high. The value of this plaster, or, properly speaking, gypsum, as a fertilizer is well established. Mr. Hancox, C.E., is my authority for saying that a chemical analysis shows it to be possessed of 30 per cent. greater fertilizing properties than what is known as the Nova Scotia plaster, and I have been told by persons who claim to have fairly tested the two varieties that there is a large difference in favor of that from the Tobique deposit. Very large quantities are quarried every year. Two mills upon branches of the Tobique, one at Three Brooks, owned by the Messrs. Edgar, and one at Quaker Brook, owned by Mr. John E. Stewart, grind the plaster for farmer's use; but the principal part of what has been quarried in the past has been taken into Aroostook County in the lump to save duties, and was ground at mills at Fort Fairfield. The quarrying and hauling is done in the winter, and I have seen in one procession over twenty teams laden with the rock, en route for Aroostook. I am informed by a gentleman, who claims to have made the subject one for thorough enquiry, that if this gypsum could be delivered in Western New York at $12 a ton, it could be sold in almost any quantity. The cost of quarrying and loading upon the cars, if a railway was built to the rock, would not be more than 25 or 30 cents a ton, so the whole question of a foreign market, in the event of a railway being built, would turn upon the rates of freight, that is, if I am correctly informed, as to the demand in New York State and in various parts of New England. Of course to render the export of this mineral profitable it must be got to market with the least possible handling, and for this purpose a railway up the Tobique as far as the Plaster Rock would be necessary. A line not exceeding 30 miles in length, leaving the New Brunswick Railway at Perth Station and passing for the most part through the continuous settlement would reach the Plaster Rock. A company has been formed for the construction of such a road and a general preliminary survey of the route has been made ... Yours truly, Chas. H. Lugrin Office of Sec. of the Board of Agriculture

Codes: X6 / LIME / IDX_Names: Tobique Gypsum; Lime - General;
S.J. Daily Sun - Mar. 9, 1886 Arthurette. - The Proposed Tobique Valley Railway. - ... But there is, I think, a brighter future for the Tobique Valley. The value of its great mountains of plaster is only beginning to be known. Farmers from Carleton County, Aroostook and Madawaska, haul the plaster a distance, in some instances, of 80 miles with their teams. They find it necessary to raise root crops with profit. It will pay 50 per cent. On hay crops and will pay a large percentage on grain sowed on sod land. The farmers find after experience that the Tobique plaster is possessed of greater fertilizing properties than what is known as the Nova Scotia plaster. There is also abundance of lime stone, said by masons to equal the Green

S.J. Globe - Nov. 2, 1888 Tobique Plaster Rock. - This property is now advertised for sale under foreclosure on 28th inst., but it is understood that arrangements have been made for the transfer of the equity of redemption of the mortgage. If arrangements are completed the property will be put into the hands of a company who will erect mills and push the grinding of plaster without delay. The price paid for the property is between $4000 and $5000."

Daily Telegraph - Nov. 5, 1888 Plaster Rock. - Messrs. J. & T. Edgar & Co. have disposed of their interest in the Plaster Rock to some gentleman in St. John, the price paid being in the vicinity of $3,000. It is understood these gentlemen will begin at once the building of a large steam mill for grinding plaster."

Codes: GYP / X6 / IDX_Names: Gypsum; Tobique Gypsum;
Evening Gazette - Oct. 30, 1890 Gypsum as a Fertilizer. - We are very apt to set a high value on things which are far-fetched and dear bought, while articles of home production, of native growth, are looked upon with suspicion and counted of little use. Our annual exports of gypsum for fertilizing purposes amount to many hundreds of thousands of tons, yet hardly one in a thousand of our farmers can speak intelligently of its value either from observation orexperiment. The mines of gypsum on the Tobique have been worked for many years, and for the most part their products have been used in the state of Maine; there are inexhaustible mines in the vicinity of Windsor, N.S., the output of which goes to Boston and New York, and thence to the farmers in the interior who learned many years ago that it was one of the most economical fertilizers that could be obtained on this continent. Many of the mountains along the northern shore of the Bras d'Or, in Cape Breton, are nothing but solid masses of gypsum that, under the summer sun, gleam down on the lake voyager like mountains of snow. What is gypsum? ... (general) ... The shipment of gypsum rock from Windsor to Boston and New York, has been almost continuous for thirty or forty years. In the old time large quantities were sent up from New York to Albany, a distance of 150 miles, where it was loaded on canal boats for Whitehall at the head of Lake Champlain. There it was ground and distributed in bags of 200 pounds each to the farmers of Western Vermont and northern New York. They sowed it on their grass lands, pastures and grain fields. They steeped their corn and other grains and rolled it in the

plaster before sowing or planting, and the result was most satisfactory. They also applied a handfull to each hill of potatoes at the time of planting, and again at the first hoeing and also at the first hoeing of their corn. The effect was always visible immediately after the first fall of rain. And when only a part of a field was treated to the plaster, its beneficial results were manifest at the harvest, the increase in the crop much more than paying the expense of the plaster used. The application of gypsum was never found beneficial to marsh or boggy soils, but the uplands to which it was applied were very similar in character to the uplands of this province, and if it can be used here with as good results as it has been used there, its employment should become general; farmers will of course understand that gypsum for agricultural purposes is not calcined; that is, it is ground without being burned."

Codes: X6 / IDX_Names: Tobique Gypsum;
Fredericton Daily Gleaner - Jan. 13, 1891 Advices to the Geological Survey at Ottawa say that the gypsum along the Tobique valley has been found to exist in inexhaustible quantities. This is certainly gratifying news, coupled with other recent reports of great mineral finds throughout New Brunswick. Our lumbering industry cannot always flourish, and some other will be needed to take its place. That one is mining, and there are evidences that New Brunswick would make a good mining province. The great need now is enterprise and capital."

Daily Telegraph - Feb. 16, 1892The Tobique Valley Railway. - An Arrangement has been concluded between the Tobique Valley Railway company and the C.P.R. by which the latter corporation is to operate the Tobique railway as soon as completed. About 14 miles of the road bed have been constructed and passed by the government engineer, and it is said that Messrs. Lawlor & Co. have entered into a contract with the company for the remaining portion of the road to Plaster Rock, making a total mileage from Perth station (where the road connects with the C.P.R.) of about 28 miles. As the deposit of plaster - which is largely owned by the province - is unlimited in extent and exceedingly valuable for agricultural purposes, it is anticipated that there will be a great output of plaster as soon as the road is completed, which would both yield a large traffic to the railway, and a handsome revenue to the province in the way of royalty. The whole length of the railway will probably be ready for traffic about the last of August."

S.J. Daily Sun - Mar. 23, 1892 Arthurette, Victoria Co. - Plaster business is booming now. Messrs. Stewart and McQueen have about forty teams employed hauling the rock to their mills at Quack's Brook. They also ship quantities of rock from Perth to Woodstock and other points."

Daily Telegraph - Jun. 11, 1892 Andover. - The Plaster Rock Industry is one that has millions in it. At present the operations are necessarily hampered for lack of railway communication. But this drawback is being remedied with all possible speed. Mr. D. McQueen, who will be remembered as a New Brunswick railway conductor on the Gibson branch, has
been located at Andover several years, and is engaged in this line of trade. His source of supply is at the Arbuckle rocks, 28 miles distant from Quaker Brook, from which point teams are used to convey the supply to Perth where it is loaded. Even with this disadvantage the industry pays well, but with the opening up of the railway to the section of country where the mining operations are carried on they will be developed to a much greater extent. In the winter 25 to 30 teams are employed in hauling, and about half the number of men. In summer it is more difficult to obtain the teams, and consequently operations are somewhat restricted. Presque Isle, Fort Fairfield, Caribou and Woodstock are the points that

S.J. Daily Sun - Jul. 7, 1893 Application has been made to the government for the incorporation of the Tobique Gypsum Company, Limited. The objects for which incorporation is sought are: To acquire, own and operate mines and quarries, and manufacture and deal in products thereof; to carry on the business of manufacturing and dealing in such products; to acquire and own lumber lands and carry on the business of lumbering and manufacturing and dealing in all kinds of lumber in connection with the business of mining and quarrying; and buying, selling and dealing in all kinds of merchandise. The head office to be established in the parish of Gordon, Victoria Co. The capital stock shall amount to $200,000, consisting of $150,000 of A stock, being ordinary stock of the company, divided into 1,500 shares of $100 each, and $50,000 of B stock, divided into 500 shares of $100 each, being preference stock, having preference and priority as respects dividends, at the rate of six per centum per annum thereon, and in the distribution of assets, with the provisions that the holders of such preference shares shall have the right to select two directors if the board consist of five directors, and three directors if the board consist of seven directors. The amount of capital stock actually subscribed is $104,000, being $18,000 of preferred and $86,000 of common ordinary stock. The name in full, address of the applicants, are as follows: Frederick H. Hale, Woodstock, N.B., manufacturer; John Connor, St. John, manufacturer; John Straton, St. John, barrister-at- law; Frank, H.D. Lawlor, Victoria county, civil engineer; Ezekiel B. Ketchum, St. John, manufacturer; William Turney Whitehead, Fredericton, agent."

S.J. Daily Sun - Jul. 20, 1893 Tobique Valley R.R. - ... The immense gypsum deposits at the terminus of the road are of incalculable value. This gypsum is extensively used for various purposes. The better quality is used for calcining, while another grade is extensively used in the construction of the better class of buildings. It may not be known that plaster board has to a very large extent superseded the old fashioned partitions in a building. Instead of studding the different rooms and lathing the same, as has been the practice for years, moulds are made to the exact size of the different walls, with the result that the whole side of a room is formed in one large sheet. This is practically proof against fire as well as frost. It remains, however, for the tiller of the soil to derive the greatest benefit from gypsum. Gypsum, when ground, is commonly spoken of as land plaster. In this form thousands of tons will be consumed each year. As a fertilizer it has no superior and thousands of instances may be cited to prove that wherever it has been used the stimulus given to the crops and the increased product thereby obtained has compensated the farmer for its use more than twenty-five fold. It is no exaggeration to say that land ordinarily yielding one and a half tons of hay to the acre and one hundred and fifty bushels of potatoes to the same area, by the use of gypsum, as shown by actual test, to yield three tons of hay and six hundred bushels of potatoes. The bulletins from the experimental farm at Ottawa testify to its immense value in this respect. From orders all ready and data actually obtained, the indications point to a large trade in this article, it being computed that in territory pertaining exclusively to the Tobique district that at least 30,000 tons of land plaster will be consumed annually. Prof. L.W. Bailey of the University of New Brunswick, in a report on explorations in connection with the Geological and Natural History of Canada, says that without attempting to calculate the amount of gypsum contained in the Tobique deposits, the quantity is very large - certainly many million tons."
Carleton Sentinel - Jul. 22, 1893 Another Gypsum Co. - Notice of intention to apply for incorporation of The Tobique Gypsum Co. (Limited) has been given. Capital stock, $200,000, head office to be in the Parish of Gordon. The names of the applicants, the first three to be provisional directors : ...?... Woodstock, N.B., manufacturer; John Connor, Saint John, N.B., manufacturer; Jas. Straton, Saint John, N.B., barrister-at-law; Frank H.D. Lawlor, Gordon, Victoria Co., civil engineer; Ezekiel B. Ketchum, Saint John, N.B., manufacturer; William Turney Whitehead, Fredericton, agent."
St. Andrews Beacon - Aug. 24, 1893 Letters parent have been asked for to incorporate the Tobique Valley Gypsum Mining and Manufacturing Company, with a capital of $50,000."
Carleton Sentinel - Sep. 9, 1893 The Tobique Valley Gypsum Mining and Manufacturing Company (Limited) was organized at Ottawa last week. G.P. Brophy of Ottawa was elected president; Hon. H.A. Connell, vice president, and J.B. Lynch, Ottawa, secretary-treasurer."

Carleton Sentinel - Oct. 7, 1893 F. Moore & Son have contracted with the Tobique Valley railway and will build them a mill at Plaster Rock, with a capacity of 60 tons a day."

Carleton Sentinel - Oct. 7, 1893 The C.P.R. has obtained a lease of the Tobique Valley railway and will put on new rolling stock and begin the transportation of plaster."

St. Croix Courier - Oct. 12, 1893 The Tobique plaster company, by H.A. Connell, their vice-president, have signed a contract with F. Moore & Son to build a plaster mill at Plaster Rock of a capacity of sixty tons a day; the mill to be in running order by the first of February next."

Codes: X6 / IDX_Names: Tobique Gypsum;
Gazette - Nov. 13, 1893 Quarrying Plaster Rock. - Messrs. Lawlor, Connor & Co., who have had about 200 men at work all summer on the Tobique Valley Railway, have withdrawn their staff, the work being completed. The firm have about 30 men engaged in quarrying plaster rock, and Mr. Connell of Woodstock has about an equal number at work. A mill is being erected by the Tobique Gypsum Company in which the rock will be crushed."

S.J. Daily Sun - Dec. 5, 1893 A New Gypsum Mine. - The Hon. John Costigan, secretary of state, and H.A. Connell, M.P.P. for Carleton, N.B., have been in town today in the interests of Tobique Valley Gypsum Mining and Manufacturing company. Mr. Connell, who is vice president and managing director of this company, said today that they hoped to begin operations in about three weeks. The Tobique Valley railway, which is to be the outlet of this mine, is being taken over by the C.P.R. - [Montreal Star, Nov. 30th"

Carleton Sentinel - Jan. 27, 1894 The T.V.R.R. is to commence running trains thisweek, and the grinding of plaster at the new mills will commence at once. A permanent and reliable train service will have an unmistakeable influence on the progress of the Tobique River. LAZURUS"

Daily Sun - Feb. 1, 1894 Tobique Plaster. - (Woodstock Press) - The Tobique Valley Gypsum Mining and Manufacturing company have the machinery placed in their mill at the plaster rock and are all ready to commence operation, excepting the belting, and this they will have in a few days. They have completed their trolley ways, and have placed a platform scale of sufficient capacity to weigh a car of plaster. This company has been organized but a few months, but is composed of energetic capitalists, and the building of the mill, and placing of heavy and expensive machinery have been pushed along with characteristic speed. The only thing now necessary to enable the Tobique Valley to contribute of its mineral wealth to the commerce of the world in the working of the T.V. railway. The road is built, but is not being operated. The mill cannot be successfully worked unless trains are run to bring the plaster out. Who is responsible for the running of the road; or for it not running?"

S.J. Daily Sun - Mar. 15, 1894 Will Begin Operations This Week. - The Tobique Valley Mining and Manufacturing Co. expect to begin work this week. All the machinery, etc., was in position in February, but as traffic on the Tobique road was suspended during part of the winter, the company were unable to obtain an outlet for their products. Trains will begin running on the railway this week."

S.J. Gazette - Apr. 27, 1894 The Tobique Plaster mills at Plaster Rock; one of the termini of the railway, are in operation with a full crew of men. The railway will be a great convenience to the getting of this rock to the markets. Connections made with the C.P.R. train at Perth Station will give sportsmen a grand opportunity of hunting the moose and caribou that abound in that region."

Carleton Sentinel - May 19, 1894 Tobique Valley Ry. - Through the courtesy of Chief Supt. Timmerman, on Tuesday a representative of the Sentinel enjoyed a trip over the T.V. Ry to Plaster Rock, in company with Mr. Timmerman, Hon. H.A. Connell and Supt. Stewart. The mill and mines of the T.V.G.M. & M. Co. are in lively working, some 15 men being employed, the mill now using one run, Mr. E. Hutchinson being foreman in charge of the works. A large quantity of the ground gypsum is stored in bags awaiting shipment as required by the demand, which a little later in the season will be great, orders for large quantities coming in daily. The state of the railroad is such in places that heavy trains cannot just now be run; but repairs in operation will soon make it all right. About 1000 tons of this gypsum fertilizer will have been shipped for market this week. 25 tons a day is now being ground. It is the intention of the Company to erect at once a large warehouse and office, and also a cooperage for the manufacture of barrels; they have now in shooks 5000 barrels brought from St. John. The future prospects of this important enterprise are grand, whether as regards the financial returns to the company, the railroad, and to the agricultural interest; the latter must of necessity be improved by the free use of a readily accessible, excellent and cheap fertilizer. It is encouraging to witness where a year ago were only water, rock and trees, a railroad station, siding filled with cars, time table, track scales, grinding mill, in size and character imposing, and the work of mining, from an inexhaustible quarry, of manufacturing and of shipping going on vigorously."

S.J. Gazette - May 19, 1894 In the Tobique Valley. - Business is booming atthe terminus of the Tobique Valley railway. The plaster mills are in operation, and several new buildings are being erected to serve as offices, shops etc. The company have considerable quantity of plaster on hand, which they will ship as soon as possible."

S.J. Daily Sun - May 19, 1894 On the Tobique Valley. - Business is booming at the terminus of the Tobique Valley railway. The plaster mills are in operation, and several new buildings are being erected to serve as offices, shops, etc. The company have a considerable quantity of plaster on hand, which they will ship as soon as possible. The railway is undergoing some necessary repairs which will enable the company to get their product to market. A large business will be

St. Andrews Beacon - Jun. 14, 1894 The Tobique Valley Railway has stopped running. No reason is given .... The plaster grinding at Plaster Rock has also ceased as a result of the tie-up.- Gleaner."

Codes: X6 / IDX_Names: Tobique Gypsum;

Carleton Sentenil - Jun. 16, 1894 We are informed that the Tobique Valley Railway has not ceased running, as stated in the Gleaner. If the grinding of gypsum at Plaster Rock has ceased it is, we presume, to reduce the stock on hand pending further orders for supply. Anyway, the rail road is meeting all the requirements of traffic. LAZURUS"

Carleton Sentinel - Nov. 17, 1894 Arthurette. - Another accident at Plaster Rock. John Campbell, jr., was working at the Rock, when a great mass was detached from above, and he was obliged to jump a great distance to avoid being crushed. His ankle is severely sprained."

Woodstock Dispatch - Dec. 5, 1894 Killed by a Falling Rock. - An Andover Young Man who was Suddenly Cut Off. - While working at the Plaster Rock up the Tobique. - Killed Instantly. - Remains Brought to Andover. - Inquest Held. - Funeral by the Foresters. - Everyone in Andover and Perth experienced the sense of a personal loss when it became known that C.V. Hutchinson had come to his death through an unavoidable accident at the Plaster Rock on the Tobique. Mr. Hutchinson, who was only 22 years of age, was foreman of the crew engaged in excavating plaster for Coonot, Lawlor, & Co. at their works, some 28 miles from Perth up the Tobique Valley Railway. On Wednesday afternoon last about three o'clock the accident occurred by which the deceased lost his life. He was prying out a large rock when it suddenly loosened and fell.

He ran forward to clear its path, stumbled and the heavy rock falling on his neck and shoulders killed him instantly. As soon as possible the remains were brought to his home in Andover, where his father lies dangerously ill with typhoid fever. Mr. Ezekiel Hutchinson, the father of the deceased, lives near the end of the bridge in a new two story house. It was considered advisable to hold an inquest into the cause of the death of the young man, and consequently Coroner Geo. W. Murphy summoned the following jury who met in Mr. T.J. Carter's office:- Geo. A. Wade, Geo. Baxter, Jno. E. Stewart, Wm. D. Appleby, Jas. E. Porter, H.B. Murphy, A.E. Kupkey. Dr. Wiley, who was the first witness, gave evidence as to the cause of death, testifying to the wounds as being evidently caused by the falling rock, and being sufficient to cause death. Levi Campbell said:- We were at work at a rock lodged in the side of the bank. We quarried the front away, and that left a cliff hanging against the bank. We undermined that and took part of it out. The rest of the cliff hung frozen fast in the earth. Three of us were working at it. I wanted to come down and blow it up. I came down. Deceased and Edward Giberson remained. Deceased went on the dangerous side to clear away. He cleared the dirt away, and then began prying with his bar. We asked him to come away, but he kept on prying. The rock started and he started to run ahead of it. He had to run over a pile of loose stones. He stumbled and fell, in passing over the pile, and a part of the rock passed over him. He would have escaped I think, if he had not fallen. The piece of the rock that came out weighed a ton or so. One end rolled over him. We went to him at once and found he was dead. Stewart's crew were 100 feet away. They came to us, and we carried the corpse to the train, took it to Abner Turner's on the engine, and then got a team and drove to Andover with the remains. Augustus Giberson, in the course of his testimony, said:- The deceased and my brother were working at the rock. It was five or six feet long, four or five feet in breadth. They were trying to work the rock, which stood in the side of the bank, loose, when it started suddenly and the accident occurred. The jury returned a verdict of accidental death, no blame attached to anybody. On all hands were heard the highest words of commendation for the unfortunate young man, who seems to have been a general favorite. He stayed at the plaster quarry most of the time. He had been down to Andover to see his sick father and had returned on Tuesday, the day before he met his death. The deceased was a prominent member of Court Andover, I.O.F., and the order took charge of the funeral, which was held on Friday afternoon. The remains were buried in the Methodist cemetery. By his untimely accident Mr. and Mrs. Hutchinson are bereaved of

Carleton Sentinel - Dec. 8, 1894 Tobique. - It is long since an event occurred, so sad and so unexpected as that at Plaster Rock, on Wednesday last, resulting in the death of C.V. Hutchinson, son of Ezekiel Hutchinson, Esq., of Andover. A huge rock had been loosened in the quarrying operations, and rolling upon him with all its ponderous force, crushed his head, breaking his neck and cutting off one of his arms which he had probably thrust out instinctively to preserve his balance. The blow falls with aggravated force on his parents at the present time when his father is suffering from typhoid fever. He is said to have sunk rapidly since the catastrophe thus threatening the afflicted mother with the loss at once of husband and son. Deceased was the youngest of the family and was highly esteemed among all who knew him, being of a remarkably affable and friendly disposition. He was the only member of the family remaining with his parents, a brother and two sisters having married and left the paternal roof. The suddenness and severity of this calamity have been a shock to the thinking and unthinking as well as a golden opportunity for the absurd pretences of superstition. Yet it will be long indeed before the right thinking persons will cease to sympathize with the bereaved parents in such a severe and painful trial."

Carleton Sentinel - Dec. 8, 1894 Arthurette. - Dec 3rd, '94. - Another accident at Plaster Rock, this time a fatal one. On Wednesday, C.V. Hutchinson, Esq., of Andover, was instantly killed by a piece of rock striking him. Van as he was called was a very popular young man, and made hosts of friends wherever he went. Mr. and Mrs. Hutchinson have the sympathy of the entire community. The funeral took place at Andover, on Friday 30th ult., under the auspices of Court Andover, I.O.F. of which deceased was a member. To add to the general sorrow, Mr. Hutchinson was, and still is, suffering from typhoid fever, and was unable to attend his son's funeral."

Codes: X6 / GYP / HILL / IDX_Names: Tobique Gypsum; Gypsum; Grey Brook Gypsum;
S.J. Daily Sun - Jan. 11, 1895 Land Plaster ... In New Brunswick and Nova Scotia there are immense deposits of this land plaster, sometimes known as gypsum and chemically termed sulphate of lime, and it can be procured at what seem reasonable prices. I have been led to mention in this matter because I find that during the last four or five years large quantities of plaster have been carried from these provinces to the United States, even as far west as Wisconsin and used by stock raisers as absorbents and deodorizers about their yards and stables. ... The Hillsboro quarries, and now that theTobique Valley railway is constructed, the Tobique quarries are easily accessible and contain almost inexhaustible supplies. So if we farmers can save money by using land plaster we should know it. In this and all other practices let us prove all things and hold fast to that which is good. ... W.W. Hubbard, Burton Hill, Sunbury Co."

S.J. Daily Sun - Mar. 28, 1895 The crew is at work clearing the snow off the Tobique Valley railway, and the line will be open to the Plaster Rock this week. The plaster company are prepared to fill all orders for plaster."

S.J. Daily Sun - Apr. 11, 1895 Andover. - The Tobique Valley R.R. was broken open last week its entire length to the Plaster Rock, and trains are now running, though not regularly. The mill at the terminus is in full operation and ground plaster is being shipped. The plaster mill at Quaker Brook has also been grinding."

Woodstock Dispatch - Jul. 17, 1895 ADVERTISEMENT: TOBIQUE LAND PLASTER. $4.50 PER TON AT WOODSTOCK PLASTERWORKS. Fresh, ground, now ready. We grind it very fine. Call and examine. R.K. Jones."

S.J. Daily Sun - Aug. 3, 1895 Mr. Costigan and the Tobique Lands. - The Toronto Globe in lending the weight of its great authority to the imputations on Mr. Costigan's honor and honesty may be perfectly conscientious, though it certainly does not reflect the views which prevail in its own party among those who know Mr. Costigan best. Four years ago some suggestion was made in the commons which seemed to reflect on Mr. Costigan, and Sir Richard Cartwright then took occasion in a personal explanation to remove any impression which his previous language might have caused to Mr. Costigan's damage. Probably Sir Richard and those associates of his who have long been associated with the minister of marine in parliament will do the same thing again when public opportunity is afforded them. The substance of the Globe's charge is that Mr. Costigan purchased certain plaster lands on the Tobique for two thousand dollars and was able to sell them for twenty thousand after an additional subsidy had enabled the railway company to ensure the completion of the Tobique line. The facts seem to be that the plaster property was transferred by Mr. Costigan to a company, and that the amount received by him is in shares of the company. Whether he received twenty thousand or one hundred thousand or only one thousand depends entirely on the value of the stock, which depends upon the value of the property. We have as yet seen no evidence that Mr. Costigan has made a cent out of the property or that he has done anything in regard to it that it is not honorable and proper."

N.B. Reporter - Jan. 28, 1897 At a meeting of the Tobique Valley Gypsum Company held at Ottawa on Friday, it was decided to augment the working capital to the amount which would be adequate to an extension of operations, and the requisite amount required was subscribed on the spot. Instructions were wired the manager at the mill to resume operations

2055 / X6 / K5 / Island; Dick Farm; Hartt Mine; Tobique Gypsum; Charlotte
St. Croix Courier - Apr. 14, 1910 30 Years Ago. - Mining is about to assume a leading place among Charlotte county industries. It has long been known that this country is rich in minerals which only await the application of capital and enterprise to make them a most productive source of wealth. We are glad to know therefore that their development is no longer a matter of speculation but that operations are now in progress which will become still more active during the coming summer. Considerable activity has lately been manifested at Mascarene. Men are actively employed in the 'Revenue' mine at that place, controlled by St. John parties. An assay of the ore shows that it produces $132 of silver and four ounces of gold to the ton. Great activity prevails at the Dick and Williamson mine, and the sum of $7000 has been guaranteed towards putting up machinery at once. Former assays of the ore from this mine gave $77 in silver and $21 in gold. Within the last few days ore richer than any before found has been struck and the prospects of the mine are constantly increasing. The stock has been increased 100 per cent and holders have no disposition to sell. The Mascarene Mining Co., are also placing themselves in a position to start operations at once, a number of stockholders from St.

Stephen and Calais having gone to St. George the other day with that object in view. The stock has recently advanced 50 per cent and no more is to be sold. As soon as spring opens work is to be commencedon Silver Island, near St. George, known as the Bradbury mine, now owned by parties in Boston. The Hartt mine, in the same vicinity, recently owned by Thieckens and McLean, embracing sixteen acres, has recently changed hands and arrangements are being made to work it. It covers part of the same lode as Silver Island, which is known to be so rich. It is stated also that a company will sbortlytake hold of the mines near Moore's Mills, and a gentleman has shown us a fine specimen of anthracite coalfound within a few mines of this town. If all these enterprises go forward this summer, as they promise to do, they will give considerable employment and add materially to the business of the county. Success to them all."

Codes: 0275 / LIME / G6 / IDX_Names: Woodstock Fe; Lime - General; Bricks - General;
N.B. Courier - Jul. 19, 1856 ADVERTISEMENT: The York and Carleton Mining Company. Capital, £30,000 In 1200 shares of £25 each, With Power to Increase, by the Issue of New Shares, to £100,000. Eighty seven and one half per cent of the present Capital has been paid up. Directors: James Smith, Allan McLean, John Owens, Thomas Allan, Thomas Vaughan, James Thos. Smith, Henry Vaughan, J.R. Tupper, President - James Harris Treasurer - James Smith Secretary - James Robinson. Office - Prince William Street, St. John. The above Company was incorporated by an Act of the Provincial Legislature, passed in the year 1847, and is now engaged in the manufacture of Charcoal Pig Iron, at their Works in the Parish of Woodstock, in the County of Carleton, N.B. In order to extend their operations to the manufacture of all descriptions of malleable iron, they propose to increase their Capital Stock to £60,000, by the issue of 1200 additional shares. Their Works are situated at the Upper Village of Woodstock, where they own from 30 to 40 acres of Land, intersected by a fine stream of water. They consist of One Blast Furnace, with a hotblast apparatus; Two 5 feet diameter blowing Cylinders, driven by two Engines of 30 horse power each, which affords a surplus of blast sufficient for two more furnaces; One Tilt Hammer, driven by a ten-horse engine; One Puddling Furnace; Eight Brick Kilns for making Charcoal; Two large Coal Houses, and Two sheds; One large Kiln for roasting ore; One large Storehouse; One boarding house, with Barn and Outhouses; Three small houses, and Three Barns; One Lime Kiln, and Brick Yard; and a never-5 failing supply of Water, brought to the Works by an aqueduct, from a distance of about half a mile. They have also three Tracts of Land containing 600 acres, about 100 acres of which are under cultivation, and the remainder is covered with the finest forest woods; it lies within from one to three miles from the furnace. In addition to this, they own another tract of 10,000 acres, of fine hardwood land, specially selected by the Company; and purchased by them from the Crown, and paid for by a bonus (which the Provincial Government gave) of Five Pounds per ton, on the first three hundred tons of Iron made at the Works. This land, for which no part of the paid up capital was expended, the Company now propose to throw into the common stock, in order that all the subscribers to the new stock may participate in it, in proportion to the number of Shares they may respectively take. The Mining Lease of the Company covers a tract six miles in length by one mile and a half in breadth, is for a period of ninety-nine years, and is subject to a royalty of one penny per ton on all Iron produced. The Ore is of the very best quality; the supply is inexhaustible; and wood fuel of the very finest descriptions, not only abounds in the immediate vicinity of the works, and in all the surrounding country, but both it and charcoal can be obtained at very low rates from the upper country, through which the Saint John River, for a distance of upwards of seventy miles, and its numerous tributaries, flow. Limited as the present works are, the Company can now produce about 1800 tons of charcoal Pig Iron annually, and by the construction of an additional Blast Furnace, they would be enabled to double that quantity. Having already large surplus appliances to their present Furnace, the cost of an additional one, with which they could be connected, would not exceed £2,000. Heretofore, owing to their limited capital, they have been obliged to confine their operation to the production of Pig Iron, which has been purchased by English manufacturers, and by them has been converted into the different and much more valuable varieties of Iron and Steels, specimens of which may be seen at the Company's office, St. John. Their Pig Iron, though returning a very large profit upon the cost of production, is much less remunerative than the Bar, and Plate Irons and Steels. At present the English manufacturer derives all that additional profit. The proposed increase of capital, which at the present time need not exceed £15,000, will enable the Company to produce all those different varieties. The Pig Iron which they have exported has been produced at their works at from £4 10s. 0d. To £4 17s. 6d. Currency per ton, has been sold by them at £7 sterling per ton in England, and been there re-sold at £7 6 10s. They can produce, with the additional works contemplated, all the different descriptions of Irons and Steels, and at prices proportionally low. With the proposed new works, the cost of production would be very materially reduced, as a double quantity could be produced with a trifling increase of labour, the Superintendent, Furnace Master, Clerks, and other leading men, who are all now necessary for the one Furnace, being quite competent, with the assistance of a few laborers, to manage two or more. The Company have at their office, where they may be seen, the correspondence of several persons of high standing and extensive practical experience in the Iron business, and also tables made up by them, shewing the cost of production, and the average selling prices of the

different descriptions of Irons and Steels. The following statement of the cost and prices of a few of the varieties will shew the very large profits which might be realized by the Company, if they were enabled, by an increase of their works, to produce them:- Cost of production per Average selling price ton, at the Works, cy. Per ton cy. Pig Iron, £4 17 6 Pig Iron, £8 10 0 Merchant Bar, 12 1 10 Merchant Bar, 22 10 0 Plate Iron, 14 0 0 Plate Iron, 27 10 0 Spring Steel Bars 11 10 9 Spring Steel Bars 28 6 0. The Iron produced at these works has already attained a very high reputation in England, and ranks among the best Irons in the world. It is peculiarly adapted for the finest qualities of Spring Steel, and is no doubt equally well adapted for Blister and Cast Steels. The Company offer this Stock to the public, in the fullest confidence that it will prove not only a safe but highly profitable investment for capital. Their facilities for cheap manufacture and transport are not surpassed in America; while the daily increasing demand for Iron and Steel, both in the Provinces and the United States, affords them ready and convenient markets for all that the most extensive works would enable them to produce. Our own Province alone would probably consume the whole product of the present and contemplated additional Furnace; and the consequent saving of freight, together with their other advantages, would enable the Company to compete successfully with the English and all other manufacturers. The fullest information as to the property and business of the Company - the supply of ores and wood - the quantity of Iron annually produced - and all other matters connected with the Company, can be obtained at their Office in Saint John. Form of Application For Shares To the Directors of the York and Carleton Mining Company, I request that you will allot me Shares in the above Company; and I agree to accept the same or any smaller number, and pay the deposit and calls thereon, and execute the deed when

Morning Freeman - Apr. 14, 1860 ADVERTISEMENT: Valuable Farm for Sale. By Public Auction. Will be sold by W.D.W. Hubbard, Esq., on the Market Square, at 12 o'clock on Monday, the 16th day of April next, if not previously disposed of by private sale:- That valuable Farm, situate in the Parish of Simonds, on the Lower Loch Lomond Road, fronting on Latimore's Lake, 6 miles from the City, by the Hickey Road. This farm contains one hundred acres, more or less, 15 of which are cleared, and in a high state of cultivation, and cuts 10 tons of Hay. There are four acres prepared for Oats, and manure enough to plant two acres of potatoes. On that portion of the Farm not cleared, there is an inexhaustible quantity of Black Mud, which is very valuable for top dressing. Also a heavy growth of cedar, which is now very valuable for Railway and other purposes. There is also on the Farm a very valuable Freestone Quarry. Together with a new Frame Cottage, one story and a half high, the lower flat of which is thoroughly finished, with a frost-proof cellar underneath. Also a small Barn. This farm would be a most desirable place for a gentleman's country seat, being less than one hour's drive from the City, and having a front of forty rods on Latimore's Lake, the most beautiful Lake in the county, and full of fish of the best quality. For further particulars apply to W.D.W. Hubbard, Esq., or to John McElwain, Mar 31 On the premises."

Morning News - Feb. 6, 1861 Albert County. - ... Mr. Duval was then introduced. His subject was ""Albert County - its Mountains, Mines, Minerals, Manufactures, Marshes and Mud."" ... The Marshes are a source of great wealth. They were worth about £20 per acre. The Mud deposited along the banks of the Petitcodiac was very valuable as a fertilizer, owing to the animal and vegetable remains which it contained. So fast was this mud deposited, he was informed by a settler, that if 10,000 loads were excavated from the banks in one year, the place whence it was taken would be completely filled up by the next. It is only of late years that its vast fertilizing properties became known."

St. Andrews Standard - Jun. 10, 1863 The City Pottery. - Rarely have we been more interested than we were on Saturday last in going through the above establishment, lately erected by Mr. Henry Robertson, on the corner of Union and St. David's streets. The building is three stories in height, and quite new, having just been finished and made ready for operations. The kiln in which the ware is baked is of very large dimensions, extending up the entire height of the building and is capable of containing a very large quantity of ware at each burning. Messrs. Wm. Blakey and Son, who have been nearly all their lives engaged in the Pottery business, at Newcastle-upon-Tyne, England, have the management of the manufacturing department of this establishment and seem to understand thoroughly what is required of them. On the first floor the clay is prepared for use and made into milk pans, butter crocks, flower pots, jugs and all that description of goods. Here too is an arrangement for drying the ware before baking, and here also, as a final operation before being made ready for the kiln, the glaze is applied to the different utensils. The clay from which this quality of goods are made is quite abundant on the same lot upon which the building stands, and is of a very good description - On the second floor quite another branch of the business is conducted. Here are manufactured, from clay obtained from Grand Lake, tea pots, pitchers, spittoons, salters and a great variety of such articles, the moulds for which together with the patterns are all drafted and made by Mr. Blakey, Jr. The designs for some of the pitchers and tea pots are very handsome, exhibiting considerable taste as well as cleverness on the part of the designer. For our special gratification Messrs. Blakey and Son went through the operation of making several of the articles above named, and each article was turned out with surprising rapidity and neatness. An Apartment on the same floor, through which passes the kiln before quite sufficient for that purpose without the additional expense of other drying appointments. The upper story is used as a depository for the different articles after they have received the ""finishing touches."" We were also shown some specimens of what is called Cane and Rockingham ware, a branch of the business which it is the intention of the proprietor to prosecute at an early day. As yet the manufactures are principally confined to the ""yellow ware"", at present so much in use, and judging from the specimens shown us at the Pottery and also at the establishment of Mr. Robertson on King's Square, the quality is fully equal to that of articles of the same kind imported from England or the United States, and better than this, twenty five per cent cheaper than the imported article. There are at present six men employed in the ""City Pottery"", and Mr. Robertson informs us that with the facilities now afforded, he can manufacture sufficient ware to supply the whole province. One cannot leave such an establishment as that which we have described without a feeling of pleasure, as it affords proof that there is enterprise among our own people, and while it may, if properly supported, become a source of profit to the proprietor, at the same time it tends to check the flow of our capital to foreign markets and thereby increase the amount of the circulating medium among ourselves. It is much to be regretted that there is an evident desire on the part of the many of our merchants to give a preference to foreign manufacture, even at a higher price, rather than patronize the products of home industry and enterprise. This should not be so, as it is not only an injury to the supporters of such a system. If it were not a fact that in many instances, home manufactures can be furnished at a much lower rate than the same article can be imported, there would be some excuse for patronizing foreign markets, but in the case described above it is positively asserted that an article can be furnished 25 per cent cheaper than the imported article, and under such circumstances the former should undoubtedly receive the preference. Mr. Robertson's establishment is well worth a visit, and we trust that his enterprise will meet with a suitable recognition by being largely patronized,

Daily Telegraph - Feb. 5, 1867 The Potteries. - There are three of those in and near the city, being those of Mr. H. Robertson, St. David's Street, Mr. Matthew Thompson, Sheffield Street, and Messrs. Jos. White & Sons, at Courtenay Bay. These give employment to about twenty persons when in operations, that of the Messrs. White, being the most extensive of the three, employs about fourteen persons. This is the only one kept in operation during the winter season. The coarser kind of clay used is obtained in the vicinity of the pottery. This is used in the making of flower-pots, milk-pans, spittoons, etc. A better description of clay is obtained from the vicinity of Grand Lake, and is used in making teapots, pitchers, mugs, jugs, jars, crocks, etc., which are here made to a very considerable extent. Milk-pans made of earthenware are said to be much superior than those made for dairy use, being more conducive to the raising of cream and also lasting much longer when used with care, as they never wear out. The productions of the several potteries meet with ready sale in the city and throughout the country, and have largely occupied the market, to the exclusion of the imported article in the kinds of ware here made. Unfortunately, however, no clay has yet been found in our province suitable for the manufacture of the better class of ware, such as is imported. We trust, however, that an article of the quality required may yet be discovered, in order that the proprietors of these factories may be enabled to carry on all branches of the business successfully."

Codes: G6 / IDX_Names: Bricks - General;
Daily Telegraph - Feb. 14, 1867 The Brick Yards. - The principal brick yards in the vicinity of the City are those of Mr. H.B. Crosby, City Road; Mr. James Sullivan and Messrs. Lee Brothers, Little River; Messrs. Nelson Brothers on the Loch Lomond Road, and Mr. Hopkins, Carleton. Nearly all of these make both press and stock brick, the total number turned out during the past year being about 2,500,000. In the process of baking the brick made in these five establishments not less than 1750 cords of wood are consumed. The several yards employ collectively when in operation about forty persons and a number of horses. Operations are usually commenced in May, soon after the frost leaves the ground, and continued until the last of October or the first of the following month. During the past year business has been somewhat dull owing to the fact that comparatively few brick buildings have been erected in that period. Our manufacturers have, however, with commendable enterprise, continued their operations and found a market for their wares to a large extent outside of the city. Mr. Sullivan during the past two years has sent large quantities to Halifax, a considerable portion of which were for Mr. Brookfield of this city, who has large contracts for the erection of Government buildings there. Besides these he has supplied brick for the rebuilding of Sackville Academy, and has also exported to Bermuda and other parts abroad. Mr. Crosby also exports to a considerable extent, having filled large orders for Nova Scotia and other parts. Messrs. Lee Bros., in addition to the manufacture of brick, make also drain tiles to quite a large extent; quantities of which have been sold to leading agriculturalists. Fire brick are yet imported to a considerable extent, there being no clay in the vicinity of the city of a quality suitable to make this description of bricks. At Grand Lake we learn that fire brick is made, as in that locality an excellent quality of the kind of clay required is found. Should building operations again become brisk a great additional impetus will be given to the business of the several yards in and about our city. Their productive capacity is considerably more than sufficient for the supply of any demand that has yet arisen, although when bricks are largely used here some hundreds of thousands are annually imported."

Daily Telegraph - Jan. 24, 1872 A New Brick-Making Enterprise. - At the Sessions, yesterday, Mr. Justice Donaldson threw out some very practical suggestions on the subject of the erection in the city of new buildings of brick instead of wood, and on the necessity of our young men going into the manufacture of brick. The venerable Justice will be pleased to hear that two of our young merchants have recently entered on a promising enterprise of this kind. We refer to Mr. A. Chipman Smith and Mr. Howard Troop. They have secured a good site at Tynemouth Creek, 30 miles out of the city, with an unfailing supply of clay, and good reserves of cordwood, which can be had at a low price. The place is a convenient shipping port, and already orders are coming in to Mr. George S. Parker, manager of the works. He is executing a large order for the Hon. T.R. Jones, who is preparing to build warehouses in Canterbury street. The orders are received in the winter, and determine the quantity of cordwood required, whether 500, 800, 1000 or 1200, cords as the case may be. The capabilities of brick might be made in a season if required. There is little doubt that they soon will be, for Halifax and other cities in the Maritime Provinces, as well as St. John, have, of late, been very ill off for good brick at a moderate price. We congratulate our townsmen who are engaged in this hopeful enterprise, and trust it will be a grand success."

Codes: G6 / IDX_Names: Bricks - General;
S.J. Daily Tribune - Mar. 14, 1872 Brick Making in and Near St. John - New Brick Buildings Projected. - Never, perhaps, in the history of our city has St. John presented a more business like appearance than it did last year and has every prospect of doing in the coming season. Enterprising young men are constantly starting in business to compete with and finally supplant older firms, who, in their turn, withdraw from retail to wholesale or manufacturing, and from these to quit business altogether and enjoy the result of their industry in peace and luxury. One of the natural consequences of this general prosperity is the increase of new buildings, and these, too, of a more permanent character than their

predecessors, brick having the preference when it can be obtained at a reasonable price. The increasing demand during the past few years, without a corresponding addition to the supply, induced our manufacturers to raise their price last year from Nine dollars to Thirteen dollars per thousand, and even at this rate a very ready market was found. This year they intend manufacturing a greater number than heretofore, and besides, the immense profits lately realized from this article of commerce have induced others to enter the field, among whom may be mentioned Doctor Reynolds, who, it would appear, has forsaken the healing art, removed to Lepreaux, and turned his attention to this ancient and honorable pursuit. Mr. harles McGuiggan is at present making preparations to commence brick-making in the spring upon his farm beyond Sutton's Mills, at South Bay, on the Western Extension Railway. Mr. H.B. Crosby has removed from the yard he formerly occupied on the City Road, and his place is 8 supplied by Mr. Nelson, who also works that adjoining the Disbrow house on the Loch Lomond Road. By summing up the probable quantities of bricks to be manufactured this year, we find that the supply will, in all likelihood, amount to three and a half millions. The following are The Manufacturers: James Lee, Parish of Simonds. James Sullivan, do. Edward Nelson, do. and the City --, Hopkins, Fairville. J.S. Parker, Ten Mile Creek. Charles McGuiggan, South Bay. H.P. Reynolds, Lepreaux. We might add to this number Mr. Crosby, who has moved to Moncton, and Mr. Heffer, whose place of business is in Sussex; but as their products will probably find a ready market in their own districts and very few reach the city, they are purposely omitted. Quite a number of new brick buildings will be erected in the coming season. Some gentlemen are determined to build, while others will not unless bricks are at a lower figure than they were last year, and would prefer putting up wooden houses should the price remain high. It is much to be regretted that persons should be compelled to erect wooden structures, as the late lamentable fires here and elsewhere have proved that such houses and even ""shell"" houses are utter failures. The number of wooden buildings erected on the scene of the King Square conflagration afford striking examples of the short-sighted policy of many of our citizens who are quite shrewd in other respects, while the commendable spirit shown by others in placing substantial structures on the sites of their former fire traps is worthy of all praise. Among The New Buildings about to be erected in brick, may be enumerated the following:- Hon. Thomas R. Jones's new wholesale warehouse in Canterbury Street, nearly adjoining the News Printing Office. The building that is being excavated for, by James R. Ruel, Esq., in King Street, where Messrs. A. & T. Gilmour and W.C. Gibson were burned out a few weeks since. The new Post Office to be erected on the vacant lot adjoining the Bank of New Brunswick, corner of Princess and Prince William streets. The construction of this during the coming season is not absolutely settled but it is believed that it will be commenced. Mr. George Rix Price's new hotel, to be built on the lot adjoining the Park Hotel, King Square, on the site of the Fountain House, destroyed in the King Square 9 conflagration. Mr. John Crawford's new building, also on North side of King's Square. Mr. Matthew will build on the vacant space adjoining his residence in Princess street, east of Sydney. Mr. John Brewing will erect a four story building with frontage on Union street of sixty five feet, being the site of the ""Union Hotel"" destroyed by the King Square fire. The Young Men's Christian Association will erect a handsome structure for hall purposes, with stores underneath, on the Crookshanks lot in Charlotte street, the buildings on which were destroyed by the King Square fire. This lot they purchased from Mr. Archibald Sinclair; it has a frontage of fifty feet. The Masonic Temple will be built if a suitable site can be procured. Several localities have been hinted at, and the one they are now considering is the Benjamin Smith property fronting on Germain street, and adjoining Trinity Church. The erection of this during the coming season may be considered as doubtful, at least. Messrs. Daniel & Boyd intend erecting a brick building on the vacant lot adjoining the Bank of North America on Chipman's Hill. Mrs. Stephenson builds on the site of her wooden house destroyed by the King Square fire, in Charlotte street, adjoining the St. Stephen's building. Of course, there will be stores underneath all the new buildings in this district. The Western Extension Railway Company have leased the wharf property adjoining to the southward of the Princess street ferry floats, and fronting on Water street. Here they talk of having a brick building erected, with stores underneath and the Merchants' Exchange up stairs. Its erection may not, however, be looked upon as certain this year. The St. John Building Society, having recently purchased the vacant property on the N.E. corner of Pitt and Orange streets from Judge Watters, propose erecting a terrace of good brick dwelling houses for the members, to be paid for by them in the usual way; but, if bricks be as high as they were last year, they will probably build in wood. Prospect for Mechanics and Laborers. - Such are among the principal brick buildings to be added to those already existing in Saint John, during the coming season; altogether, they will represent well on to three millions of bricks, and adding those required for steam mills, wooden buildings, sewerage and other public works, the demand will probably reach four millions during the coming season. The production, as before stated, will, probably, not exceed three and a half millions, leaving half a million bricks to be imported should all the 10 contemplated works be carried put. The four millions of bricks required will give employment to about eighty men and twenty seven boys in the manufacture, and the labour alone in building them afterwards will represent about $32,000, giving employment to upwards of 100 men daily during the summer. If we consider the lime, wood work, finishing and other etceteras connected with these buildings alone, what an immense amount of capital it will represent when compared with the operations of any other single year in the history of this city; and all citizens and mechanics especially have good reason to be proud of this remarkable prosperity. Mr. Chesborough, the City Engineer of Chicago, expects that three years will obliterate any signs of the late disastrous fire which swept over that city at the beginning of the winter. Let Saint John enter the arena and contest the claim of the Western Metropolis to be the most enterprising city on the continent ""in proportion to population"", and shew in every succeeding year greater enterprise than that displayed by its predecessor, and the oldest inhabitant, when he returns from seeing his distant friends, will scarcely recognize the home of his childhood."

Telegraph Journal - Nov. 4, 1929 Plants Turning Out Brick, Clay Products Kept Busy. - Firm of L.E. Shaw, Ltd., Manufacturers and Distributors of Interlocking Hollow Brick for the Maritime Provinces, Has Bright Future. - Le. Shaw, founder of L.E. Shaw, Limited, manufacturers and distributors of interlocking hollow brick for the Maritime Provinces, with plants at Avonport, N.S., and Chipman, N.B., has had a life-long experience in the manufactures of brick and burned clay products. Beginning in his father's plant at Avonport and later operating plants at Bridgetwon, Middleton and Annapolis, N.S., Mr. Shaw in 1910 organized the Valley Brick and Tile Company, A year or two later this company was taken over by the Nova Scotia Clay Works, Limited. Mr. Shaw remained as manager of the Annapolis plant, the other plants in the Valley having been closed down until the autumn of 1914, when the depression caused by the outbreak of the war necessitated the closing of that plant. it was then that Mr. Shaw returned to Avonport and began the manufacture of brick himself. Up until 1921, when the firm of L.E. Shaw was incorporated, brick and drain tile were the chief products of the Avonport plant. In that year, however, the rights to manufacture the interlocking tile were secured by Mr. Shaw and the whole-hearted support given to this new building unit by the construction industry in the Maritime Provinces marked a turning point in the industry of this company. The manufacture of other types of structural hollow tile was then undertaken and in recent years the Avonport plant has been devoted almost exclusively to the manufacture of this type of burned clay products. About a year ago there came the question of either further plant expansion at Avonport or the establishment of a branch. The industrial development in New Brunswick, coupled with the opportunity afforded by the raw materials in the Minto coal area for the manufacture of a shale product, induced the directors to seriously consider that district, the result being that in October, 1928, construction was commenced on the plant at Chipman. This plant is the only one in the Maritimes manufacturing shale brick and hollow tile and uses the very latest and best machinery and equipment. Shale Popular. - Today, in the brick manufacturing field, shale is rapidly replacing clay as a raw product, some of the reasons being that shale does not possess the laminated structure of the clay brick; it withstands a higher temperature and is more uniform in size. Previous to the establishment of the Chipman plant, all shale brick and tile used in the Maritime Provinces was imported from the provinces of Quebec and Ontario, or the United States. The modern process of brick manufacturing is most interesting as the materials are followed through the operations of mining, milling, drying and burning. The shale used at Chipman is brought in railway cars from Minto, where it is raised from the coal mines as a waste product. Entering the mills it is crushed, ground and passed into storage bins, thence to the pug mills and brick machine, from which the 'green' bricks can be put out at the rate of 15,000 per hour, loaded on dryer cars, and thence passed into the dryer, from which they are taken and set in the kilns for burning. The kilns at Chipman are of the circular round down-draft type, using draft created by large motor driven fans. The preliminary burning is done with waste wood obtained from the saw mills at Chipman. Coal is used in the latter phase of the burning process. The bricks are burned from six to seven days with a temperature of approximately 2,000 degrees Fahrenheit. A system of underground tunnels is used so that the heat given off by the cooling brick is led from the kilns through another large motor driven fan and into the dryers. This utilizes the heat which would otherwise be wasted. From the kilns the brick may be loaded directly into railway cars on the through siding connecting with both the Canadian Pacific and Canadian National Railways. Directors. - Beside the president, L.E. Shaw, other directors are H.W. Phinney, vice president and managing director of Maritime Finance, Limited, and a director of Phinney's Limited; Major J.A. MacPherson, secretary-treasurer, who has also had a long experience in connection with the manufacture of clay products, and G.S Stairs, civil engineer, formerly town manager of Windsor and Wolfville. Ronald Shaw, a recent graduate of Acadia University, is now at Chipman in charge of that office. He is assisted by W.S. Holmes, superintendent, and John S. Phalen, recently of Knoxville, Tennessee, an expert in the manufacture of the best grades of brick and hollow tile. W.A. Hills joined the firm of L.E. Shaw, Limited, about a year ago and has devoted his attention particularly to the promotion of the use of structural hollow tile in residences. With the new spirit and optimism so apparent today in the Maritime Provinces, the future of this industry,

Kings County Record - May 16, 1930 The Natural Resources Of New Brunswick. - Interesting Paper Read by Mrs. Wm. King at Meeting of Newtown Women's Institute. - ... Our MineralResources. - More than 25 minerals of economic importance have been discovered in N.B. While considerable development work has been done, comparatively little headway work has been made. At the same time, N.B. may yet prove a great source of mineral wealth. Coal is the principal mineral mined - in Minto, Queens county. Gypsum is second in importance. Large deposits ofan excellent quality of this mineral are to be found near Hillsboro, Albert Co. The Albert Mfg. Co., Hillsboro, manufacture and export large quantities of commercial gypsum annually. It is one of our largest manufacturing concerns. Much gypsum rock is also shipped from Hillsboro. Natural gas and oil are produced in Albert county, nine miles south of Moncton. The gas is used for domestic heating and lighting in Moncton and Hillsboroand to some extent for power. The oil taken from the same wells is sold chiefly to the Canadian National Railways.Granite quarries are located in St. John, Charlotte and other counties, where granite stone is quarried for building purposes, monuments, etc.Limestone is found in many parts of N.B. The principal lime plants are in St. John county, where large quantities of commercial lime are produced. Last year nearly 13,000 tons of ground lime stone was ground from limestone rock by the Brookville Mfg. Co and sold to the farmers in all parts of the province. The use of ground lime stone for most of our soils has been found very beneficial and profitable to use.Brick is made from our clay in several places.Grindstones are manufactured and exported. Boring has been done in several places for copper, oil shale and other minerals but no great development has yet resulted. The value of the mineral production for New Brunswick in 1927 was $2,148,535."

Kings County Record - Jun. 6, 1930 Diatomite Deposit in Kings County. - The taking over of the deposit of diatomite at Pollet Lake, Kings County, by a company with strong Canadian and U.S. backing, marks the beginning of a new industry for this province. An increased demand for diatomite in the world market at large has led to the expansion in the Maritimes of an industry that has been little known save for those who are directly interested. International Diatomite Industries, Limited, has recently brought under one organization the leading developed and undeveloped reserves, of diatomite in the Maritimes, utilizing and expanding the existing facilities for production and marketing, The financing of the company has been arranged by the board of directors, among whom are Ray Donaldson, president, formerly president of the Oxford Tripoli Sales Co., with diatomite deposits in Colchester County, N.S., and finish mill at Haverstraw, New York; M.F. Gregg, V.C., vice president, formerly of Scotia Diatom Products Ltd., with deposits and plant at Little River, Digby county, N.S.; Hon. J.G. Winant, New Hampshire; W.P. Fuller, president of Atlantic Gypsum Company, Inc., and Frank M. Ross, vice president of the Saint John Dry Dock and Shipbuilding Co. Ltd. The company has just recently acquired the Pollet Lake deposit, where development work will commence this year. At its Nova Scotia holdings plant expansion is nearing completion at Little River, and this summer will see the beginning of increased output from there as well as from New Annan. Combined reserves of tremendous tonnage of raw material, a large and steadily growing market, sound direction and management and strong financial backing would seem to indicate that International Diatomite will pay a profitable and important part in adding to the production wealth of the Maritimes. Diatomite is an exceedingly light and fluffy material, composed of myriads of minute, highly porous, siliceous skeletons of diatoms. It occurs either as an unconsolidated powder at the bottom of freshwater ponds, lakes and streams, or as dry compact beds, many feet in thickness. Although diatomite and its uses were known in ancient times, it was apparently overlooked for centuries until about 70 years ago, and it is only within the last 15 years that some of its most valuable uses have been discovered. These uses fall into three classes - insulation against heat and sound, Filtering certain solutions, including sugar syrup, fruit juices, essential oils, vinegars, drugs, etc., and as an admixture in concrete and plasters, to increase workability and durability. From the point of view of size, purity of product and accessibility, the deposits of diatomite brought together under International Diatomite Industries Ltd., are the most important in the British Empire."

Codes: G6 / IDX_Names: Bricks - General;

Daily Telegraph - June 3, 1873 Brick Making in Crouchville. - Only 35,000 a Day Turned Out! - The manufacture of bricks is beginning to be quite an important branch of industry in New Brunswick, and the amount of capital already embarked in it is considerable. Heretofore the market has been comparatively limited, owing to the fact that wood being cheaper building material is more extensively used, and as the demand for an article limits its supply, it has happened more than once that the quantity of bricks obtainable, within a given time, was not sufficient to serve the requirements of the builders, the system of hand labour employed in the manufacture of bricks being only capable of affording a limited supply within a given time. For this reason, manufacturers of brick throughout the province have been, of late, directing their attention to the introduction of labour saving machinery, and numbers of brick making machines have been imported, chiefly from the United States. None of these, however, appear to have given satisfaction or even to have worked remarkably well. The senior partner of the firm of Lee Brothers, who has long been engaged in the manufacture of bricks, states that none of the American machines which he has seen, and he has examined and tested most of them, will answer for New Brunswick, or at least for the brick yards in the vicinity of St. John. The reason is that the clay here is of a stiffer and more tenacious character than the brick clay commonly used in the United States, and does not work so well in their machines, the same cause also accounting for the smaller size of bricks made in the United States, the material being less tenacious. Lee Brothers, desiring to introduce labor saving machinery into their business to meet the call for increased supplies, were compelled to turn their attention to the machines of European manufacture, and have just imported a brick machine, from London, which meets their requirements to the fullest extent. One of the Telegraph staff paid a visit to their works at Crouchville, a day or two ago, so that we are able to present to our readers a description of this novelty, it may be as well to state at the outset, that Lee Brothers' importation is the only machine of the kind in America, and in Europe it has only been in use for about two years. The brick maker is driven by a twelve horse power, high pressure engine, making 70 revolutions per minute, and is placed in a small building with a covered and enclosed apartment for the engine and an open roofed shed for the machine itself. The clay is obtained from an immense bed of that article, which covers the whole flat, the present supplies being drawn from a place within thirty yards of the machine and conveyed to it in barrows. The clay is then fed into a hopper from which it passes between two corrugated iron rollers of large size, weighing 1500 lbs. The effect of this transit is that any stone or hard substance in the clay is thoroughly pulverized, and the clay itself is intermingled with the proportion of sand which is necessary for the proper manufacture of the article. When the clay leaves these rollers it is in short strings about 8 or 9 inches long, resembling short strands of rope yarns. It is then put into another box in which two small shafts are working close together, each shaft having along its entire length blades similar in shape to the blades of a steamer's screw propeller, and knives which cut the clay in every direction and mix it in the most thorough manner, so that the whole is of precisely the same consistency throughout. As the clay passes between these shafts it receives a strong forward motion, and is driven with great force, between two large, smooth, iron rollers, which work only 3/4 of an inch apart, and from them it is forced into a box, 9 inches long and four inches deep, without sides, through which it is driven. The box forms the brick clay into a long web, corresponding in width to the length, and in depth to the width of a brick. Before it leaves the box the web is lubricated by a small jet of water, which at the same time gives a smooth finish to the outside. The web then passes on a broad band until it comes under a wheel, which is made to revolve at a speed exactly proportioned to the speed of the web, and which cuts off the web into bricks 2 7/8 in depth as fast as it reaches it. This wheel is the most ingenious part of the the whole affair, and is a great triumph of mechanical skill. As the forward motion of the web is continuous, it is obvious that a wheel set at right angles to it would impede the passage of the web, and that a knife of any considerable width would have the same effect, even were the wheel set diagonally. To overcome both of these difficulties, the wheel is set diagonally, and so arranged that the degree of set is less or greater, just as the speed of the web is diminished or increased, so that, however fast the web may be moving, the cut is precisely at right angles to its passage. The cutters, which form, as it were, the spokes of the wheel, are of fine wire, and offer, of course, no appreciable resistance to the movement of the web in their passage across it. The clay web, as it passes the wheel, is cut by it into bricks of perfect dimensions and shape, and the only thing that remains to be done to them is to sprinkle them with a little sand, to prevent them from sticking together, and to lay them out to dry, preparatory to being burnt. The machine is capable of making 35,000 bricks a day, about 18 men being required to conduct the whole operation, including the digging out of the clay, attending to the engine, and piling away the bricks to dry. In addition to this it must be remembered that, 3 owing to the enormous pressure on the clay, the bricks as they leave the machine are much harder, and firmer, and more compact than hand made bricks, and in every way superior, and so rapidly is the work done that clay, in two minutes from the time it is dug out of the bank, appears at the other end of the machine a perfect brick. The machine works with such unceasing energy that those who feed it and attend to its demands are kept busy as nailers, and have little idle time on their hands. The 12 horse power engine which has already been spoken of as the motive power of the machine has been put up for Lee Bros. by Messrs. Bond & Moore, and the work has been well performed. As no one here had ever seen a machine of that sort in operation, the work of putting it together was necessarily difficult, and the proper speed at which it should run could only be ascertained by a series of experiments until the proper standard was reached. All this Messrs. Bond & Moore have done in as admirable a manner, taking a real personal interest in the successful working of this new venture in brick manufacturers. The establishment of Bond & Moore is located at the Marsh Bridge. Another admirable feature in the new machine should not be omitted. It is provided with friction wheels which slip and stop the working of the rollers in case any serious obstruction, such as a large stone gets into the machinery. This entirely does away with the danger of the machine being broken or injured. Lee Brothers, the proprietors of the establishment, have been engaged in manufacturing brick for many years. They have now about 300,000 made bricks on hand, and expect to make two and a half millions this season, as the machine is capable of being operated in weather which would render the making of brick by hand entirely impracticable. Their establishment is well worthy of a visit, and they deserve great credit for their enterprise, in importing so admirable and so costly a machine, as the one we have just described. Its cost was $4,500, but judging from

Codes: I6 / G3 / G4 / IDX_Names: Silica, Tripoli, Diatomite, Infusorial Earth; Granite; Mascarene - General;

S.J. Daily Telegraph - Jun. 3, 1873 Saint George and Its Resources. - ... Having some idle time on his hands, the writer determined to visit the now well known Red Granite region which commences at the Canal, as the stream from Lake Utopia emptying into the Magaguadavic is called. This is distant two miles from the village, thence this granite extends north about two miles, forming high hills on either side of the river. Two companies are at work quarrying among these ancient mountains, whose origin and constitution is so involved in the mist of ages. One company formed principally by St. John merchants, the other by New York capitalists. The New York Company have, as manager, a gentleman from Peterhead, one whose business has been for years the manufacture of Peterhead Granite. He is well adapted to the duties of his office, being eminently practical. The beauty of the St. George granite consists not only in its color, but in the regularity of the perfect transparent quartz crystals, thus giving brightness to the semi-opaque felspar which alone is colored red; there is in it but little mica or hornblende, either of which are incapable of receiving a polish. The New York Company contemplated erecting polishing works at St. George, and the Saint John company intend building a tramway from their quarry to the sea; a distance of little more than three miles. In so far as location is concerned either company seems to be equally well situated. Hearing that the same kind of stone had been found at Bocabec on the shore of Passamaquoddy Bay, and that there was a sample in St. Andrews, I examined a piece at Mr. Clark's hotel, but found it valueless. I have seen or heard of no similar stone ..?.. Elsewhere than at St. George. A very singular deposit of Silica, nearly pure,and in a very finely divided state, has been found a few miles below St. George. The sample shown to me was attached to a piece of sod, extending six or eight inches beneath it, and looks very much as if six or seven inches .?. Of green sward had been repeatedly dipped into flour, and which had adhered to it every time they came in contact. The peninsula between the Magaguadavic and L'Etang is intersected by various veins of copper, sometimes mixed with lead. There are also there veins of lead, in which I hear, is a proportion of silver. All these, however, at the surface appear small. At some future day when they have been explored to some depth, they may and probably will yield such returns as will materially add to the income of the country."

Codes: G6 / IDX_Names: Bricks - General;

Daily Telegraph - Jun. 28, 1873 Tomb of an Antediluvian. - About a fortnight ago mention was made of the discovery of animal remains in the noisy beds at Hopkin's brickyard in Fairville. The yard in question is on the bank of the river, just below the station of the E. and N.A. Railway. Here there is an extensive kiln floor, covered with a large permanent wooden shed, capable of holding a kiln of 150 to 200,000 brick. There are about 100,000 bricks in the yard now in process of preparation for the kiln. Mr. Hopkins seems to have chosen an excellent site for brickmaking, directly on the shore of the St. John River, and close by the railway station above mentioned. Just on the top of his clay beds there is a bank of about eight feet of sand, which can be rolled down in any quantity required; the clay itself contains numerous seams of sand, which greatly facilitate working. The mill is driven by steam, which effectually mixes the clay and sand, and at a much more rapid rate than the old fashioned horse power mill. It was in getting clay for brickmaking that the workmen came across the remains of some unknown creature. A number of the bones were missing, but enough remained to show that it was a carnivorous animal, and probably a dweller of the sea. The skull closely resembles that of the Greenland seal, and the bones on the left side of it were considerably worn, most likely from having been exposed on the sea bottom for some time, before being entirely covered up by mud. There were about fifteen large backbone joints, with corresponding ribs, and a few bones of the tail: the bones of the loin, as well as those of the fore limbs were missing; but such of the leg bones as remained indicated hind limbs of considerable size and power. The skeleton appears to have been that of an animal about four feet long, and the portion recovered was in an excellent state of preservation. The occurrence of vertebrate remains at a depth of twenty-five feet beneath the surface is not common in this country, and naturally excites surprise, for the brick clays here have not been known to contain skeletons of large animals, and the remains found in them hitherto have been those of corals, sea shells and sea weed. In the sands, which generally conceal them, a few relics of large animals have been found; thus, in Cape Breton, the remains of a mastodon were taken from the sand; and near Lepreaux, in Charlotte County, N.B., part of the lower jaw bone of a whale was found by Mr. Chas. McLean; but this ""find"" at St. John is the first discovery of a large animal in the (older) clay beds of the Maritime Provinces. We may conjecture that it is many tens of thousands of years since this seal ""rolled its oily head 7 upon its hinges, and breathed with delight the elastic air."" The tomb of this antediluvian creature was of black sand, blackened by the abundance of decomposed organic matter in it, and containing the remains of mussels and other small sea shells. Just above it is about eight feet of clay and sand in alternate layers of from one half an inch to six inches thick, also of a dark colour, which, under the name of ""mussel mud"", some enterprising agriculturist may, at a future day, dig out for manure. It would be a good application for the dry and sandy land of the ridge on which the station is located, giving it richness, and at the same time, helping it to retain moisture. The clay below the bed in which the seal was found also has partings of black sand, but at more distant intervals, so that six or eight feet below the sandy seams are a foot apart, and the clay is of a strong reddish color. The top of the mussel mud bed has been cut and worn in the olden time by water, and it is thus separated from the overlying clays by an irregular waving line. These upper clays are more sandy and the layers of sand more irregular in thickness than those of the mussel beds, and of a light-brown colour. This portion of the deposit is about seven feet of pure pale-brown sand, with which, in the upper two feet, a good deal of gravel is mixed. Clays of the same age as those in which the seal's carcass was buried are found in the vicinity of Montreal, and there also the remains of a young Greenland seal were found some years ago. On the Ottawa River there are numerous clay-stone concretions, some of which enclose dead capelin - a small kind of fish now living on the coast of Newfoundland; and at another point in Lower Canada the overlying sands covered the remains of a whale, of a kind now supposed to be living in the Gulf of St. Lawrence. Any of our readers who desire to see the spot where the seal was found will find Mr. Hopkins ready to point out the place, and give such information in reference to it as he furnished. For the above most

S.J. Daily Telegraph - Oct. 29, 1873 A Large Kiln. - At Mr. J.W. Lanergan's brick yard, near Little River Bridge, Courtenay Bay, a kiln is now burning, which is probably the largest ever fired in the province. It contains 250,000 bricks, and has 24 arches. The quantity of wood consumed in the burning will be 140 cords, and it will no doubt be finished by Saturday night. Mr. James Fox is foreman of the yard. When this burning is finished Mr. Lanergan will have about 375,000 bricks on

Morning Freeman - Oct. 30, 1873 Large Kiln. - The Telegraph says Mr. Lanergan has a brick kiln now burning, the largest ever fired in this Province. It contains 250,000 bricks, and has 24 arches, and will consume 140 cords of wood."
Colonial Farmer - Nov. 10, 1873 A kiln was burning in Mr. J.W. Lanergan's brickyard Courtenay Bay, containing about 250,000 bricks and has 24 arches. The quantity of wood required was 140 cords."

Codes: J7 / IDX_Names: Clay - General / Grand Lake Fire Clay, etc.;
Daily Telegraph - Mar. 4, 1875 Courtenay Bay Pottery. - Among the many different branches of manufacturing industry which have of late years been growing into importance is one that may be considered well worthy of notice, in a community where manufactories are as yet but young. Its history is, we presume, but a repetition of the experience of all who have attempted the manufacture of goods that had previously been imported, and the difficulties attendant upon such an enterprise can only be appreciated or understood by those who have experienced them. The establishment of the Courtenay Bay Pottery (Messrs. F. & J.A. White) has been no exception to this rule; indeed for many years after it was started it did not pay even the interest of the outlay, but by patience and perseverance the difficulties have been gradually overcome, and the demand for the wares made there has increased so rapidly that the proprietors are scarcely able to meet it. A visit which we recently made to their establishment convinces us that they may well be congratulated, not only on the ownership of a well appointed manufactory, but also on their prospects of business for the future. Their manufactories consist of all descriptions of brown earthenware, flower pots, tobacco pipes, etc., all of which are pronounced by competent judges to be quite equal to imported goods; one proof that they are also considered so by the public generally is the steadily increasing demand for them, both in this Province and in Nova Scotia. They have also been introduced into the United States, but the proprietors are not at present prepared to push the sale of them there. In going through the works we were shown the many different processes through which a piece of common - not to say dirty - looking clay has to be put before making its appearance in the ware-room as a well finished article of domestic use. The first process is the preparation of the clay, which has to be thoroughly cleansed from all foreign substances before it can be used; to effect this it is put to soak in large tanks sunk in the ground, and containing a sufficient quantity of water to cover it. After being soaked for 12 or 15 hours it is well stirred up until the whole is a thick pasty fluid; it is then strained through a number of sieves, of different degrees of fineness, in order to extract any stones or other objectionable matter there may be in it, after which the fluid clay flows into a long and shallow brick tank (technically called a slip-kiln) having a false bottom of tiles, under which are flues, from a furnace at one end. The whole mass is then boiled until enough water has been evaporated to render it of a consistence sufficiently solid for the shaping into ware. When this has been done, it is taken off the slip-kiln, while hot, with spades, beaten into a smooth, solid heap and left to cool. When the heap of clay is cooled, which is in about 16 or 18 hours, it is cut into thin slices with a spade, and beaten well with a large wooden mallet again into a heap, in order to temper it equally, after which it is cut out in square lumps and carried into the next workshop. Following our lump of clay we next find it taken in hand by the thrower and his attendants, usually two boys. One of the attendants takes a lump of clay and, placing it on the bench before him, cuts it into two nearly equal parts with a thin brass wire, he then takes one part and raising it high in the air, suddenly dashes it down on the other with all his might, which operation he repeats until he deems it ready for use; the object of this severe treatment is to express the bubbles of air left in the clay and to render it perfectly solid. He then weighs out a certain portion, previously determined upon, and hands it to the thrower. This formative genius we find comfortably seated astride a suitably prepared bench, having close in front of him a kind of trough, in the centre of which is a smooth, flat circular plate or block of iron, which is made to revolve at great speed by means of a crank and multiplying wheels, this being the duty of the other attendant alluded to. As soon as the clay is ready for him he seizes it in both hands and dashing it down on the block, proceeds to fashion it into a pan, crock, jug, jar, pitcher or pot, according to his fancy or the requirements of his employers. This is the most interesting part of the potter's art and consequently the one most frequently alluded to in Scriptural and other

writings. The skill with which the clay is manipulated is wonderful to the beholder and is only attained by years of steady, patient practice; the moment the lump of clay is thrown upon the block, the attendant starts the wheel, and the thrower, wetting both hands, firmly grasps the clay, and in a moment, before any one can even guess what he intends to do with it, he has made it into a shapely column by another instantaneous movement it is a flat circular cake; by the insertion of one of his thumbs, it becomes a shallow pan, next it is cone-shaped, then becomes a fanciful shaped vase or flower-pot, and finally, by the application of a tool to the outside, it becomes a smoothly finished crock, and all in an incredibly short time. He then cuts it from the block with a thin brass wire, the attendant removes it, placing it on a board, and the same process is again repeated until the board is filled, when it is carried into an adjoining room, heated by means of a brick stove and flues, to be partially dried preparatory to the next stage. When dried sufficiently to bear handling without bending, the handles are stuck on with a little fluid clay, and it is then passed on to another workman, who takes it in hand, and dexterously using it as a scoop takes up a small quantity of white looking fluid clay from a shallow tub, giving the article a turn or two, he next pours out the clay, leaving the inside coated with a white wash, and the outside its original brown. Still following our lump of clay which has now become a crock, we find ourselves in the drying room. This room, about fifty feet long and ranged on each side in the middle with racks, in which the hoards of ware are placed to dry, is heated by means of horizontal brick flues extending its whole length, through which the heat and smoke of the furnaces used for preparing the clay, are conducted, after passing under the slip kiln already described. In this room, which is always very warm, the ware is kept several days, or until it is perfectly dry. It is then taken to the glazing room, and in the same skilful manner in which it was whitened inside, it is now coated inside and out with red. This red wash contains all the component parts of glass, ground to an impalpable powder, diffused in water to about the consistency of paste, and in which all articles requiring to be glazed are dipped. When the ware is burnt, this red wash melts and forms a thin coating of glass on every part of the article to which it has been applied. The potter is indebted to a knowledge of chemistry for his glasses, and in compounding them no small amount of capital has been spent, and no end of experiments made. Every manufacturer has his own prejudice on the subject of glazes, and as a general rule prefers his own method of compounding them. After the glaze has been applied, in the manner described above, the ware is taken to the kiln to be burnt. The kilns, of which there are two, are massive, iron bound, brick buildings, circular in shape, with an inside lining of fire-brick clay to the height of about 10 or 12 feet, where they are covered in with a crown or dome, the whole surmounted with a tall conical chimney, each kiln having seven fire places. In filling the kilns great care is necessary, not only on account of the fragile nature of the goods, but also to fill the kiln completely in every part, as the same degree of heat would be required to burn the ware, whether the kiln be perfectly or imperfectly filled. For the convenience of piling up the goods in the kiln, various contrivances are used, the principal one being the sagger. Saggers are roughly made vessels, some resembling in shape a small wash tub, others being oval, and of various depths, to suit the different kinds of ware they are required for; they are made of Grand Lake fire-clay, mixed with broken fire-bricks, and their only use is to protect the ware from dust and the flash of the fire which would discolour it; the ware is carefully placed in them, and they are then piled up one on another, in the kiln, as high as it is considered safe to put them, each tier, when at its height, resembling a solid pillar; in this way the kiln is filled completely, the doorway is then built up with firebricks and plastered over with sand and clay to exclude the air, and a small fire made in each fire place, and very gradually increased, until the requisite degree of heat has been attained, when the fires are allowed to go out and the kiln allowed to cool slowly, the whole process occupying from the time of lighting the fires, until cool, two and a half or three days. The burning is a very critical process, requiring the most careful watching and the exercise of sound judgement in its operation, as by it all the labor and skill previously expended in making the ware are perfected or wasted, a very small degree of heat more or less than is necessary rendering it almost if not entirely worthless. When cool enough the goods are taken out of the kiln and sorted, each piece being examined separately, the bad being broken, and the good taken to the wareroom to be packed and sent away. All the work described above is done in the lower part of the building. Accepting an invitation from our guide to come up stairs, we find ourselves in a large, comfortable and well ventilated room, where a number of men, women and boys are at work making tobacco pipes, of which they can turn out from 150 to 200 gross weekly. Their work is light and easy, and appears to be done very systematically. On the same floor are other large rooms, one used as a carpenter's shop, where the boxes for packing the pipes in are made, warerooms, etc. On the whole, we felt very well pleased with our visit, and left feeling convinced from the steady perseverance already shown, and the systematic manner in which the business is carried on, that it must, in the course of time, assume very much larger proportions, the amount of business done now being more than double that done three or four years ago. The building is a large and commodious structure, well adapted for the business, having been built under the personal supervision of the present owners, upon the site of a former one destroyed by fire in 1870. In conclusion, we would recommend any one who feels

Peters &Spencer are authorized to collect bills for the same. F.A. Steeves. Bridgedale, Coverdale, A.C., Aug. 10,

Daily Telegraph - Sep. 11, 1877 New Brick Yard. - Mr. Evans and his partner, Mr. Nelson, have entered on the brick-making business, in a well situated locality, near the city, with every prospect of success. They have 200,000 bricks almost ready for market."

Codes: G6 / IDX_Names: Bricks - General;
S.J. Watchman - Aug. 7, 1875 Brick Making - The old-fashioned plan of making bricks by horse and hand-power is a tedious, unclean process. There is about it a large amount of dirty work for man, and an enormous amount of heavy dragging for the poor beast, - all of which is avoidable by the steam mill, such as that in operation in the brick yard of the Lee Brothers, Courtenay Bay. Here brick making becomes a rather gentlemanly business, - it certainly does not require just such close quarters in the handling of the raw material as the old plan, while the work is executed with remarkable despatch. The Lees are very favorably situated as regards facilities for their work. The land, which lies near Little River, is owned by Mr. James Davidson, who lives alongside. The deposit of brick clay is, probably, inexhaustible. The bank from which the clay is at present being taken is eleven or twelve feet deep, - that is to say, eleven or twelve feet is now being worked, but there may be, and probably there is, twenty to thirty feet immediately below this working bank, for eleven feet is as much as the workmen can comfortably handle. Five men are now getting out of this bank the rough clay, which they place in barrows and wheel up to a flat car, drawn by a horse, which carries it by rail to the mill. The barrows are generally wheeled up to the end of the line, and are ready for the horse car by the time the latter returns from the mill. The distance of the clay bank from the mill is only about one hundred yards, and the car is kept going constantly without loss of time. The mill itself is a sort of three-decker. The barrows of clay are dumped on the upper deck, the tramway being nearly on a level with that portion. Here two men are kept busy feeding the crusher which breaks up the clay, and sends it below in a very fine condition; and so well adjusted and perfect are the revolving wheels which constitute the crusher that it is impossible for any foreign substance to get through without being broken as fine as powder. Following the clay, we descend to the second story, where we find that the crushed clay and clean sand, moistened with some water, are shovelled rapidly into the mixing machine, where they are thoroughly combined; then a few feet below, on the ground floor, as it were, the compound is pressed out of an aperture or die, in a continuous body, just the length and thickness of a brick, and as it passes along it is received on a table, mounted on wheels, which holds

as much of this clay as will make, say, six or seven bricks. While resting for a moment on this table, a frame, standing on edge, with wires from top to bottom, is quickly pressed through the clay, - and presto six or seven bricks lay ready made, as far as the raw material can make them. The steady movement of this lengthy bar of clay over certain wheels presses the wheeled table out from the machine; when the bricks are cut and removed, the table returns to its former position, ready to receive any installment of the worked clay to be cut into another batch of brick. A car stands waiting to receive a load of these wet bricks for transference to the drying ground, which is effected by horse-power and a railroad, and by the time the horse has unloaded and returned another car is loaded and waiting. Almost everybody has seen a brick kiln. Messrs. Lee have a very spacious yard, and at the principal steam works they keep three kilns going. They employ, altogether, thirty to forty men and boys, - nearly all men, - during the busy season, and these hands have to work lively. The mill keeps all hands busy. There are men in the pit, - the men who handle the horses and carts, - the men who attend to the crushing, and those who see to the mixing; the men who attend to the die, and the boys who attend the cutting table; the men who see to the drying and who wheel to the kiln, and who attend the kilns after fire is set, - none of these have any idle time, if their work is properly laid out and their is proper supervision; and we judge there is no failure in this respect. Four of the six Lee Brothers give their personal attention to the work, one of them devoting himself more particularly to securing orders and attending to the business part of the enterprise, most of his time being spent in the City. The mill will turn out, on an average, 20,000 bricks per day, and she has been run at the rate of even 50,000 per day. Two millions of bricks do not constitute a very heavy season's work; and the probability is that in the future, with a revival in building operations, the demand for bricks will test the resources of all our local yards, as it is yearly growing more certain that between the greater liability of wooden buildings to take fire, the excess of repairs needed for them, and the extra charges for insurance, bricks will be more and more called for in the future. The enterprise of Messrs. Lee is

Morning Freeman - Aug. 17, 1875 Grand Lake Fire Brick Co. - Mr. John Simperly writes to say that he has no intention to interfere with the new company organized for the manufacture of fire brick. He wishes them well, but he desires it to be known that he has no share or interest in the business. He rented the place where the fire brick clay is found at $48 a year, and expended, he says, $3000 in opening it up, making drains, building wharves, &c. In 1869 he received notice to quit. Mr. Simperly gives his opinions of the extent, depth and breadth of the clay vein, but this, we think, we should not publish. He ..?.. to look on the line for the Intercolonial ..?.. deposit of any fit to make stone ..?.. fire brick. We hope he will be successful ..?.. has been found and ..?.. clay."

Daily Telegraph - Feb. 1, 1878 Mr. Thomas McHenry recently submitted to us some specimens of fire clay found in Albert County, used in making pottery, firebricks, etc. A mug made from the clay seemed to leave no doubt as to its value for making stoneware, firebricks, etc. A similar clay is now imported from New Jersey by Brantford potters. The article is also imported from England. Mr. McHenry also showed us some specimens of what he believed to be hydraulic cement, the analysis of which will be awaited with interest. Mr. McHenry proposes to have further inquiries made as to the quality of those minerals before taking steps to develop them. We are reminded of the subject by a notice in the Sackville Post, from which it appears that the development of the minerals is being proceeded with, that they are well situated and most abundant, and that their development will add greatly to the railway traffic of the county."

Daily News - Aug. 7, 1879 and Chignecto Post - Aug. 7, 1879 Albert Items. - The parish of Alma promises to be a busy place. It has long been known that rich deposits of copper existed in several places, and some of these were worked to advantage some time ago. A gentleman connected with the Newfoundland copper works has been here lately, leased the McKinley property, and proposes to put a large number of men to work at once. Another party are prospecting up the brook, and the outlook for Alma is quite cheery. Harvey has its mine of anthracite and stonequarries .... Mr. McHenry's patient efforts in the developmentof the resources of Albert is being rewarded, and the parish of Hillsboro rejoices in rich deposits of brick and pottery clay, lime, etc."

Codes: G6 / IDX_Names: Bricks - General;
S.J. Daily Telegraph - Aug. 18, 1879 St. Martins. - A brickyard is in full operation under the supervision of Mr. W.A. Reid."

Moncton Daily Times - Sep. 16, 1879 Bricks. - We have more than once invited the attention of intending builders to the great advantage of using bricks instead of wood and it seems to us that a reform in this particular ought, so far at least as Moncton is concerned, to be commenced at once. We had an opportunity yesterday to visit the brick yard of F.A. Steeves, Esq., at Mud Creek, Coverdale, three miles from Moncton, and were glad to find that Mr. Steeves has unequaled facilities for producing brick at the lowest possible prices. An excellent clay-bed, plenty of sand on the spot and good shipping facilities are all to be found here, and Mr. Steeves, with an enterprise that is most creditable, has recently invested in one of the most approved and best brick making machines in the market. He has been somewhat unfortunate in his purchase of an engine, but that can be remedied, and when this is done, Mr. Steeves will be able to turn out bricks as rapidly as necessary and as cheaply as they can be made anywhere. The only thing necessary is the demand, and this will no doubt be very great as soon as the price is brought down to a figure that will make it cheaper to build of brick than of wood. After careful consideration we conclude that bricks at $5 per m. are as cheap as wood; but in Ontario they are produced at $4 per m. at the kiln, and in Quebec, we believe, still lower. But without suggesting a minimum figure for a brick supply here, we have pleasure in knowing that Mr. Steeves has the ability, the enterprise and the will to meet all reasonable requirements in this particular. The Peters' Lock Co. are likely soon to want a large quantity and altogether we may hope that the brick era is about dawning on the people of Moncton. So mote it be."

Daily Telegraph - Sep. 23, 1879 ADVERTISEMENT: Notice of Dissolution of Co-Partnership. - The co-partnership heretofore carried on by the Subscribers under the name, style and firm of Nelson & Evans, as brick manufacturers, has been this day dissolved by mutual consent. All persons having any claims against the co-partnership will please present the same to Evan Evans for settlement; and all persons indebted to the firm are requested to pay the amounts due by them to Mr. Evans. S.J. Daily Sun - May 4, 1881 Natural History Society. - The Natural History Society held their May meeting last evening at the residence of G.F. Matthew, Esq., one of the vice presidents of the Association. The meeting was well attended, and two new members were elected. The address of the evening was delivered by Dr. L.C. Allison, his subject being diatoms. He said that his earliest investigations in microscopic research while a student at college had been in connection with this widely distributed species of organisms, and since that time he had always taken a great interest in their study. It has been for some time a matter of dispute whether diatoms should be classed as animals or plants, but the balance of authority was in favor of the latter opinion. They are of exceedingly small size, being from 1-200ths to 1- 3000ths of an inch in diameter, and of various shapes. They are to be found at the present day almost everywhere, in both salt and fresh water, and their remains are to be met with in all the geological formations above the chalk. The diatom consists of a siliceous envelope or shell in two parts, holding between them the jelly like living body of the organism, which receives its nourishment from the surrounding leginds through thin spots in its envelope. When the diatom has lived out its little day the jelly like substance dries up and disappears, leaving the indestructible envelope to last for ages. These are found in large deposits, often covering many acres to the depth of several feet, and forming what is known as diatomaceous or infusorial earth. Such deposits exist in many localities in our Province, and where their usefulness is better understood will add materially to its mineral wealth, the earth being used as a polish powder, and is the manufacture of silicate soaps, water glass, silicate paints and gun- cotton and dynamite. Dr. Allison instructed his hearers how to collect these interesting forms and exhibited several of them by means of the microscope."

Codes: I6 / GEOL / IDX_Names: Silica, Tripoli, Diatomite, Infusorial Earth; Geology - General;

Daily Telegraph - May 4, 1881 Natural History Society. - ... presented the Society with the Report of Progress for 1879-80, and several Geological maps of the southern part of the Province. Dr. L.C. Allison then delivered an address on Diatoms. He remarked on the abundance of these curious minute organisms in the vicinity of St. John, and the interest he had taken in their study for many years. Diatoms occur both as marine and fresh water forms. It was long a doubtful question whether they belonged to the animal or vegetable kingdom, but the latest researches have placed them in the latter, and they are nowrecognized as a sub-class of the Algae. In size these organisms vary from one two-hundredth to one one- thousandth of an inch in length. They are symmetrical in structure, and consist of simple cells composed partly of silicious or flinty matter, and partly of a mucilaginous or jelly-like substance, which is almost wholly protoplasm. They are various shapes, some being circular resembling a pill-box, as the doctor described them, while others are long and narrow, tapering to a point at both ends; but there are various intermediate forms, many of them very beautiful, as seen under the microscope. Their motion (for it appears they have the power of propelling themselves in the water, a fact which led early observers to suspect they were animals) is supposed to be caused by their sucking in water at one end and ejecting it at the other. They are found on seaweeds along our shores and in ponds and lakes, in the floating vegetable matter which is seen around their borders. When dead their silicious portion often forms alluvial deposits, or is more generally known as infusorial earth. Geologically, they occur as far back as the cretaceous or chalk formation and from that period up to the present forming considerable areas or beds in certain localities. The city of Richmond, Virginia, stands on a deposit of this kind. When consolidated into rock, whetstones, etc., are made from it. The lecture, which was a very interesting one, was illustrated by a number of specimens, which the doctor exhibited through microscopes. Mr. G.F. Matthew also showed specimens of siliceous earth, consisting largely of diatoms from Lawlor's Lake and other places, and spoke of its economic importance, stating that it was used in the preparation of soap and also as a polishing material. A hearty vote of thanks was tendered Dr. Allison and Mr. Matthew at the close of the meeting."

Daily Telegraph - Jun. 15, 1881 Economic Minerals of New Brunswick. - Although New Brunswick is inferior to Nova Scotia in minerals, it still is entitled to consideration in that respect, and it is not improbable that at some not distant day we shall see some new developments in connection with the mineral wealth of this Province. A few words now, (in answer to several correspondents) in regard to the useful minerals of New Brunswick which have been so far discovered. The coal areas of the Province are very extensive, and although the seams are thin, not more than 22 inches, and only worked at Grand Lake and one or twoother places, it is quite possible that they may have eventually be worked much more extensively. It is estimated the Newcastle coal basin alone contains upwards of 100,000,000 of tons, most of which could probably beobtained. When St. John becomes a great manufacturing city this coal will no doubt form an important factor in its prosperity. The Albertite has had a great history, but present appearances are unfavorable to that mining interest. There are several seams of anthracite in theDevonian strata at Point Lepreaux and also at Musquash. It has, however, not yet been determined whether these seams can be worked with profit, owing to the large amount of ash left after combustion. Copper ores have been found in many places inCharlotte, in Albert and elsewhere, but, so far, have not been worked with profit. Baryta, used for making, or rather for adulterating white lead, has been found at Frye's Island, Charlotte Co., where also galena and silver have been found. Minute quantities of gold have been found from time to time in several localities, but nothing has beendone in the way of mining. Argentiferous galena has been found in several localities. At Wannemake's, on Hammond River, the galena has been found to yield a fair proportion of silver. In 1878, on the west side ofMusquash harbor, yellow sulphuret of copper and galena were found in veins of white quartz, to the amount of $14 per ton, as was shown by actual assay. The hardness of the rock and the smallness of the vein are, however, against its profitable working. Considerable quantities of silver have been found in the same locality. Bituminous shales are found extensively inAlbert, Kings and Westmorland, capable of yielding from 65 to 90 gallons of crude oil to the ton, but they are of little value so long as petroleum is so abundant. Bog iron ores, believed to be of commercial value, have been found at Burton, in Sunbury, and also at Maryland in York. Large deposits of iron ore of very superiorquality are found at Jacksontown and other parts of Carleton County. Some of these samples have yielded as much as 48 per cent of iron. There seems to be no doubt that these mines will eventually be worked with profit. Black sand containing magnetic iron ore has been found at St. Martins, in the vicinity of St. John, and elsewhere. Antimony is found in great quantities in PrinceWilliam, York. These mines are worked with profit and the quality of antimony is excellent. It is largely used in making Babbit metal. Manganese is another profitable New Brunswick mineral. It is found at Markhamville, Kings County; in the County of St. John, on the South West Miramichi, and elsewhere. In addition to these minerals, there are manyothers more or less widely distributed. Clay fit for bricks and pottery is abundant. Granite in various colours is widely distributed in Charlotte and Queens, and red granite is largely exported to the United States and Upper Provinces. Graphite, or black lead, is foundnear St. John, and also in Queens county. Grindstones and freestones of the best quality abound, especially about the head of the Bay of Fundy. Gypsum is also abundant inAlbert and Westmorland. It also occurs in Kings and St. John Counties and on the Tobique. Kaolin fit for the manufacture of pottery is found in the granite districts of Charlotte. Limestone is abundant and is found of the best quality about St. John.Iron pyrites is found on the St. John and Miramichi. Saltsprings exist at Sussex and in the parish of Upham. There are other minerals of less value which might be named,but these we have mentioned are sufficient to show that the mineral wealth of the Province is by no means inconsiderable. A survey made with a view to practical economic results, rather than a mere scientific survey, might prove advantageous to the Province."

S.J. Daily Sun - Oct. 26, 1881 A Thriving Industry. - A Visit to the Courtenay Bay Pottery Works. - Another Evidence of the Benefits Conferred by the National Policy - New Manufactures. - On the east side of Courtenay Bay, a short distance to the left of the old St. John Penetentiary, is situated the Courtenay Bay Pottery, of which Messrs. F. & J.A. White are the proprietors. The works extend over a large area of ground and in several respects surpass any of the kind at present in existence in the Dominion. A reporter of the Sun visited the establishment yesterday, and, in the absence of Mr. White, was shown through the works by the foreman, Mr. Henry Beck, jr. The firm have lately begun the manufacture of Rockingham and cane ware, and a very successful attempt has been made to produce majolica. The store at the entrance to the building is filled with specimens of all different varieties of Rockingham, cane and common earthenware. It is only recently that Messrs. White have begun the manufacture of Rockingham and cane ware, owing to the difficulty experienced in obtaining the right kind of clay. This has been obtained, however, by a mixture of clay from Grand Lake, Nova Scotia and other places. The protection afforded this trade by the National Policy has also had an excellent effect on the business, manufacturers in the Dominion being thus given control of the home trade, to the exclusion to a great extent of the English manufacturers, while the prices are much less and dealers are thus allowed a larger margin of profit, and enabled to sell to consumers at lower rates. The effect of this in respect to such an article of common use as earthenware will be readily seen and appreciated. The quality of the home made article is not one bit inferior to the English manufactures; indeed, one dealer of large experience states that the Rockingham, produced by Mr. White, is far superior to much that he has imported. These goods were awarded a diploma at the recent Dominion Exhibition at Halifax. Mr. White sells his goods at the same rate as they are sold in England, and in addition lands them at the stores free of all breakage and freight and other costs incident to importation. The value of this to dealers will be appreciated, when it is remembered that the breakage in many crates is very large, due to carelessness in handling. An importer in this city some time ago received a crate which did not contain a single whole article, and as it could not be ascertained who was to blame, he had to sustain the whole loss. Mr. Beck, after showing the samples in the store to our reporter, led the way into the manufacturing department, where some 40 men, boys and girls were found busy at work. The manufacture of Rockingham ware was explained. A quantity of rustic teapots were being made. Five different moulds are necessary for a single teapot - one for the pot itself, one for the spout, one for the handle and two for the cover. After being placed in the moulds these are put in the drying room, and after a certain length of time the ware is burned in biscuit, then glazed and afterwards reburnt, when the article is ready for sale. There are two large kilns in the building, each provided with seven fire-holes. In the paint shop were seen a lot of rustic hanging pots and other flower pots for lawns and decorative purposes. The stock of moulds is very complete, and the workmen are experienced in the business, so that the output is only limited by the demand. In the tobacco pipe room are employed a number of boys and girls. This department, it is claimed, is the finest of the kind in Canada, none of the others being as large or running as many moulds. The making of a pipe is quite interesting: The clay is first rolled, then seasoned to a certain state, and when it has reached the right temper it is moulded. A needle is inserted through the pipe and it is then put in the mould, the stopper forming the bowl of the pipe and meeting the end of the needle. By the machine used in this pottery much time is saved by an invention of Mr. White's, whereby the surplus clay outside of the top of the bowl is removed at the time of moulding. After being withdrawn from the mould the pipes are trimmed, at which work six girls were engaged yesterday. The brown ware department is on the ground floor. The clay is all stored in this floor and a quantity is always kept ready for use, and two

plugging machines are kept going, preparing pipe and red clay for use. The plugs are circular and hollow, several feet in height and inside are revolving knives by which the clay is cut up and forced out through a hole at the bottom in lumps ready for use. In order to obtain the finer qualities of clay there are large bins in which the different varieties are mixed and then put into slip pans, under which are fires, and by which a fine grade of clay is obtained. In the brown ware department, a thrower, as he is styled, was working at the wheel, making large flower pots. Their manufacture is most curious to the observer. A piece of clay is thrown into the revolving wheel, filled with water, and shortly you will see rising from the surface the form of a pot, which , rising still higher, is moulded into the desired shape by the workman. It is then placed on a stand to dry, after which it is burnt. In the other end of the room a jigger was engaged manufacturing caneware, such as wash bowls, basins, etc. There is a glazing mill in which all the glazing required in the manufacture of Rockingham and cane ware is ground. The machinery is run by an engine of eight horsepower, manufactured by James Harris & Co., which has given good satisfaction since it was put in four years ago. Messrs. White have on hand a large stock of seggars in which the wares are burned, as well as all other kinds of necessary materials, and are prepared to meet all home and foreign demands. Their principal trade at present is in the Maritime Provinces, but they send considerable to Montreal, and have had orders from Manitoba. They can compete favorably with Quebec makers, being able to keep them pretty well out of the Maritime Provinces."

Moncton Daily Times - Aug. 10, 1882 For The Moncton Cotton Factory. - Messrs. Lee Brothers, of Little River, are loading brick on the I.C.R. cars at the Haymarket Square, St. John. They have already shipped thirty carloads for that purpose."

Moncton Daily Times - Aug. 25, 1882 Bricks! Bricks! A Moncton Want. -- It would do Moncton a great deal of good if some enterprising individual would practically demonstrate the fact that good building bricks can be supplied to our townspeople at $5 per thousand, and would also convince people of the additional fact that at this price they are cheaper than wood for the walls of buildings, sidewalks, sewers and other purposes for which wood is now used. In Ontario bricks are sold at the kiln at $4 per thousand and the consequence is that in many of the farming districts half the houses are built of this material. That they can be supplied here as cheaply as Ontario there is no reason to doubt, the only necessary condition being that there be a sufficient market. It is of course quite easy to understand that the brickmaker who peddles out a hundred thousand bricks a year must obtain a good round price in order to compensate him for his time and trouble, while he could sell much lower if he could be assured of a demand for two or three millions annually. We are satisfied (though on this point we should be glad to have the opinions of practical men) that bricks can be laid down at any point in Moncton at $5 a thousand, and pay the manufacturer a reasonably good profit, provided that he be able to sell a sufficiently large quantity every year. We are satisfied also (this is a matter to be settled by arithmetic) that the first cost of a house wall, or of a sidewalk, made of bricks at this price, will be less than if built of wood. If any one don't believe this let him reckon for himself. Taking sidewalks, for instance, he will find that one and a half thousand bricks will lay as much walk as a thousand feet of three inch plank, and a fair quality of such plank will cost more than $7.50, the first cost of the bricks at the price we are figuring on. Again let any one who knows what wooden walls cost, figure on the relative expense of bricks at $5 a thousand, and we are much mistaken if he does not find that the brick wall will cost less (first cost) than the wooden one. If this be so, or if we are approximately correct in our calculations, the fact is apparent that bricks ought to be very extensively used in Moncton. Several millions might have been used, it is reasonable to believe, if our theories are correct and a supply had been available to builders. The past cannot be recalled but as the prospect is that building operations ...?... Moncton will for many years afford a ready market for several million bricks annually if only they can be supplied at a moderate price and there is equally good ground for the belief that they can be so supplied if only confidence in the market can be established. Have we not men of enterprise who will think over these matters and undertake to give us plenty of bricks at moderate price for next year's building operations? Whoever will do so will we hope, make some money, but of this we are sure, he will do an invaluable service to the town and will deserve to be gratefully remembered."

Daily Telegraph - Feb. 8, 1883 New Brunswick Minerals. - Favorable Impressions of Mr. Symes. - Result of his Observations in Westmorland, Albert, Kent and other counties. - A member of the Telegraph staff, falling in with Mr. E. Symes, and conversing on his impressions of the province, diverged from agriculture into mining, Mr. Symes expressing higher opinions of our mining resources than are generally entertained. As he has travelled a great deal and given attention to the subject, the Telegraph representative was glad to hear his views. They can be inferred from the general scope of the interview. In your observations on mining, Mr. Symes, what portions of New Brunswick have you visited? The greater portion of Westmorland, Albert, Kent, a part of Kings, Queens and Sunbury, St. John and the North Shore counties. Was the object of your visit to examine the agricultural resources of those counties? Partly so, and partly to find out the general condition of the country. Also to make observations as to its geological formation and the probability of the existence of minerals of economic value. You are then, interested in minerals? I am. During the last summer I have been endeavoring to find coal suitable for the manufacture of coke. In this I was acting in the interest of some firms in England who wished information on that point. I was not successful in finding any during last autumn, but I am of the opinion that if I can spend a few months next summer, I will find a few beds, as favorable indications are observable. Are the indications such as lead you to hope to find coal in sufficient quantity to pay for working? I believe so, as I have already found several small seams ranging from 1 to 2 feet in thickness at no very great distance from the surface, and the indications are that at a few hundred feet thick seams would be struck. Do you speak now only of bituminous coal? Certainly, and apparently, judging from specimens, bituminous coal of good quality and remarkably free from sulphur. There are indications of anthracite, and I am strongly of opinion that a vein of this coal stretches across the Province. It would probably be found fully 700 or 800 feet below the surface. At what depth can anthracite coal be profitable? I believe in Pennsylvania beds are worked at a depth of several thousand feet. The deepest coal mines in the world are in Westphalia. They are, I believe, over 3,000 feet deep. The Pictou mines, I am told, come next in depth. What is your opinion of Grand Lake coal? I don't consider it of extra quality, but I attribute that to the fact that it is ruined near the surface. There is probably plenty of coal in Queens, of good quality, which only needs capital and enterprise to develop it. A good investment might be made there by provincial capitalists in exploring the district very thoroughly. Do you know anything about Albertite coal? I think it was once a liquid, and in that respect it differs from other coal. It is a solidified oil, and was probably thrown up into pockets by volcanic eruptions. My opinion is based upon experience gathered in Galicia and Bukowina, Austria, in searching for oil, erdwax and ozekarate. The latter two are oil in a semi- solid state, and forms the crust around the pockets or springs where oil is formed. They exist, though in a less solidified form, in Pennsylvania. I think the indications promise further valuable discoveries in Albertite. Did you notice indications of oil? Yes; both in Westmorland and Cumberland. I bored in both places and only stopped for want of a little capital. Oil oozed up along the boring rods until I collected several bottles full. In Cumberland I tapped the side of a hill for eight or ten feet, and by the next morning I had collected a saucerful of quite pure oil, which dropped from the hole. The indications occur there which are found where oil is profitably worked. Would you state, shortly, what they are? The presence of saline springs, which would seem to show the presence of rock salt underneath. In Europe, when explorers want to find oil, they look for salt first; and when the salt is found, they bore for the oil, which is invariably found in the hard rock underneath the salt. Secondly, the existence of black rotten rock, to use the common term. This is always found near oil, and its peculiar character is due to the presence of oil. These are the principal indications, and they are both found in Cumberland and Westmorland. Are erdwax and ozekarate of commercial value? Yes, of high value. The first is a hard substance of brownish-black color resembling Albert coal, and from it some of the highest grades of oil are extracted. The residue, after the oil is extracted, forms the ozekarate, which can be then bleached and made into a substance resembling white wax, and is used in the manufacture of candles and tapers under an Austrian patent. Price's patent candles factory, of Liverpool and London, is among its largest users. Have you ever heard of it being used in America? I am not aware of any being manufactured here, but large quantities of the raw material have been shipped to Europe. It is made into candles, toys and various ornaments, to make which wax was formerly employed. You would consider it a valuable article? If plenty of erdwax could be found, it would probably be more valuable than either Albertite or oil. Do you think there is any other coal in the eastern district except Albertite? Yes; I have evidence of the existence of fine anthracite and some bituminous coal. I am interested in a mine of bituminous or Tar coal in another locality. I have a half interest in

the mine. You have, I suppose, noticed the presence of other minerals? Westmorland contains deposits of several valuable minerals; but there appears to be more iron than anything else, both of red and brown hematite and an immense quantity of iron pyrites. There are indications of copper, manganese, galena, and also of an oxide of silver. In Albert there are similar indications. The copper there is of a better class than that of Westmorland, being mostly black copper ore. Did you observe any silver ore? I am doubtful if there is any in Albert county. The formations, so far as found, are not such as would carry silver ore. In Kent there is silver, specular iron and bismuth - also a good deal of oxide of lead, large deposits of ochres, and, I think, other valuable minerals. Did you find any gold in your travels over the Province? Yes in several places; in alluvial soil, in washings and also in quartz; but the most that I have seen as yet has been in the alluvial deposits. Upon what land did you find these deposits? Upon government lands, which have been totally unexplored. Then the government yet has the right to all the advantages from a discovery of gold? There is little doubt that they have; but the mining laws of the province are so vague at present that, if I understand their tenor, the owner of the land has the exclusive right of mining, and therefore, can prevent the development of mines upon his land, should he choose to fix an exhorbitant price for the privilege. It is otherwise in Nova Scotia. Did you observe any graphite? I have seen some indications and small deposits of graphite, which I believe to extend right across the country. What is your opinion of its value? So far as what I have seen in New Brunswick, I do not consider it of such commercial value as would pay for working in large quantities. Why do you form this opinion? Because it lies in a small seam, in some places at great depth and intermixed with a hard slatey slate, which contains immense quantity of sulphur in the shape of pyrites, and the material itself is of a poor quality, and after being ground has a somewhat gritty nature and is only suitable for mixing with better qualities found elsewhere. Only fit for one or two purposes, and the expense of getting, manufacturing and mixing would be too great to permit it being placed on the market so as to compete with a better quality. What is the difference between plumbago and graphite? Nominally none; but commercially a very great deal. Plumbago is a much softer material and formed of pure carbon. Graphite, technically speaking, is also carbon, but it contains, or is allied with other and harder substances. Did you find zinc or tin? No tin; but a little zinc, principally allied with bismuth. I think it might be found in quantity, but have not been able to explore sufficiently. I have some good specimens of zinc. Did you observe any clay of commercial value, except for ordinary brick making? I did, and am somewhat interested in a property,which contains a large amount of an excellent quality of white pipe clay, also dark blue and red fire clay, which are both very valuable for fire bricks, tiles, etc., and all classes of pottery required to stand great heat. Practical men have pronounced it some of the best they have seen in America. Generally, how would you sum up your opinion of New Brunswick as a field for the investment of capital in mining enterprise? My own conviction is that it is a good field, having a varied and a rich class of minerals; but as yet the resources of the country are unknown, as little seems to have been done in the way of systematic exploration. What has been done, except cursory scientific explorations, has been done by a few private individuals more as a pastime than as a business enterprise. One great drawback, in my opinion, is that few people have a sufficient knowledge of minerals when they see them to really know their value. To this may be added, the lack of enterprise of the people generally, coupled with the apparent indifference of the Government in not seeking to have the real value of the land yet remaining to be disposed of. The Crown yet holds over one-third of the Province, which has

Codes: G6 / IDX_Names: Bricks - General;
Moncton Daily Times - Mar. 15, 1883 Bath Bricks and Where They are Obtained. - The Petitcodiac River, At Moncton, Said to Have a Deposit Similar to that Used in Making Them. - We find the following in the Winnipeg Commercial, but do not know from what source it was obtained by that journal: Bath or scouring bricks are made on the quick rising banks of the river Parrot, near the town of Bridgewater, Somersetshire, England. The mouth of the river (which is a tidal one) is at Burnham, on the British Channel coast. The water that flows up the river is noted for its sandy and muddy appearance. For a mile above and below the Bridgewater town bridge trenches of about 100 feet long by four feet deep are made so as to catch the sand as the waters flow with the ebb tide. It takes about three weeks for the trench to fill up with sand and slime. Both are taken out and, after a little drying, made into bricks in the ordinary way of making building brick. Numerous attempts have been made to make the bricks from deposits in other portions of the river banks, but to no purpose. Two individuals and town companies are all that are engaged in the enterprise. The price is about $5 per 1,000, only F.O.B. on ship at Bridgewater. The brick resembles bath stone, both in color and grain, which accounts for the title. The river Petitcodiac, at Moncton, New Brunswick, seems to have a like deposit to that of the river Parrot. It is said that a small river on the east coast of Scotland has a like deposit, but that few bricks are made there. The manufacture of this useful material seems to have a solitary location."

Daily Telegraph - Jun. 19, 1883 Accident in a Brickyard. - A young man named Desmond, belonging to Little River, who is employed in Lee's Brickyard, met with a severe accident yesterday while engaged at his work. He was digging clay from the base of a high bank, and had undermined it to such an extent that the top caved in and buried him under a mass of clay. As soon as possible the injured man was removed and brought to the city and examined by Dr. Addy. He was then conveyed to the General Public Hospital. The injuries are all internal, and of a very serious nature. It was not known last

evening whether they would result fatally or not."
S.J. Daily News - Jun. 20, 1883 Fatal Result. - Patrick Desmond who was injured at Lee's brickyard on Monday, died at the General Hospital yesterday afternoon. He was a married man and leaves a wife and several children. Coroner Earle has been notified and will hold an inquest on the body this afternoon."

Codes: G6 / Z2 / IDX_Names: Bricks - General; Sandstone, Building Stone, Monument Stone, etc.;

Moncton Daily Times - Aug. 30, 1883 Brick Making. - Messrs. Cummings and Thibideau, whose yards are in Lewisville, will make this year in the vicinity of two million bricks. Mr. Cummings employs some 35 or 40 hands and has now made nearly three quarters of a million, while Mr. Thibideau employs about 30 hands and has burnt about 500,000. The latter's bricks are all hand made while Mr. C. uses steam. The industry is quite an important one. A ready market is found in the town for all the bricks made while builders have had to import from Sussex and possibly other places. The demand for brick and stone this year has been unusual. The Messrs. LeBlanc, contractors for sewers and the Presbyterian church, are among the largest buyers."

Codes: G6 / IDX_Names: Bricks - General;

Moncton Daily Times - Dec. 10, 1883 Brick Making. - Mr. Gibson is making the bricks used in the construction of his mill at Marysville. It is said they cost him only $3.50 per thousand. About six millions are required to complete the mill. Mr. Gibson is by far the largest individual employer of labour in New Brunswick, if not in Canada. His cash outlay since January 1st is said to have been $1,500,000, a large part of which has been for labour. His cotton mill will cost $700,000."

S.J. Daily Sun - Oct. 3, 1883 Exhibition. - Mineral Exhibit. - The Queen Mining Company, of Sussex, managed by Major Markham, furnishes amost interesting exhibit, in a small space, of manganese ores prepared for the use of consumers. The coarser or low grades are used principally in the manufacture of bessemer steel, the market for which is found in Europe; the higher grades are used in the manufacture of glass, varnishes, bleaching agents, etc., and are exported to the United States. Along with the finer ores may be seen the manganese in rocks, in which it occurs in pockets of lower carboniferous limestone, and specimens are also shown of iron ore and dog tooth spars, which sometimes occur with the manganese. Messrs. W.N. Gould and F.W. Stockton show a varied assortment of mineral ores from various districts in the Province. As these are not arranged with any degree of regularity, nor the localities given where they have been found, the display loses some of its value in consequence. Silver galena, copper, manganese and other ores are shown. Mr. Gould also has some specimens of Albertite coal, ground plaster, phosphate of lime, hydraulic limestone, gypsum, lithographic stone, asbestos and verdantique marble. The Natural History Society of New Brunswick display a fine collection of gold-bearing quartz and gold dust from the Waverley mines of Nova Scotia. The different coal companies of Nova Scotia furnish specimens of their products. Those represented at the Exhibition are the Joggins, Minudie, Acadia and Spring Hill mines, and all the different grades and qualities are shown.The different lime and brick kilns about St. Johnhave specimens of their productions on exhibition, andthe N.B. Granite Company make a handsome display both of grey and red granite. The New Brunswick Salt Springs Company showspecimens of fine and coarse salt, manufactured by them at their works, in Upham, King's County. The Lake George Antimony Mines are wellrepresented, not only by specimens of ores, but also by the different processes and materials used in the preparation of metallic antimony. The Lawrence Antimony Mine, of Queen's county, also exhibit specimens. Silver and copper ores are also shown by R.R.Call, Esq., of Newcastle, and copper ores by Dr.Goodfellow of Sussex. Very fine specimens of native copper ore, occurring in trap rock, near North Head, Grand Manan are exhibited. A map of Nova Scotia showing the occurrence of mineral ores in that Province, was sent by Dr. Gilpin of Halifax."

Codes: J7 / X1 / IDX_Names: Clay - General / Grand Lake Fire Clay, etc.; Grand Lake Coal;
S.J. Daily Sun - Feb. 6, 1884 (for the Sun) - The Coal Beds of Newcastle. - by Edward Jack. - The coal fields of Grand Lake containing, according to the reports of the Geological Survey of Canada, over one hundred and fifty million tons of that mineral, have been worked to a small extent for many years, the output continuing to be small, not on account of the difficulties attending the raising of the coal,but owing to the rude system of mining followed there, and the lack of the proper means to transport it to distributing centres. Now that there is a probability of the duty on coal being removed by the United States and a railway constructed to the mines, it is not at all unlikely that these despised beds may yet become a profitable source of revenue to a country which, once rich in timber is now suffering from its loss and that the lumbermen who once got his living by chopping trees above ground, will be able to do so now by digging in the shape of coal the remains of plants and trees which a kind Providence ages ago - long before the birth of man - hid away for his use in these last times. Never having paid any particular attention to these coal fields, I determined last autumn to give them a personal inspection so as to be able to speak advisedly respecting some portion of them at least. On the 9th of September last, I embarked in the company of a friend on board of the May Queen for a visit to Newcastle, Grand Lake. On board of the boat on our way up we met Mr. McFarlane, of that place, a very intelligent man, who has been for some time engaged in the coal trade, and from him gained the following information:- The yearly average yield of coal at Newcastle is about 6,000 tons, the cost of raising about $1 per ton, of transportation from mine to wharf at Newcastle 75 cents, freight to St. John about 60 cents. The work is all done by hand, but it could be much cheapened by the use of steam for pumping and hoisting, as the water is now carried away from the workings by expensive drains. The coal beds undulate with the surface of the ground, and when the summit of the undulations is reached, the working is abandoned. The average thickness of good coal is about 30 inches, but there is a good deal of difference in its quality. Newcastle produces the best coal in the market for blacksmith's use. A bed occurs at Mr. C. Sullivan's, about four miles from Newcastle wharf where coal can be shovelled from the surface at a cost of 50 cents per ton, and this is excellent for blacksmith's use. This bed is about 38 inches thick, though a parting of shale about 2 inches thick occurs on it. Mr. McFarlane thought that the hardest and best coal in Newcastle has not yet been reached, owing to the short distance to which the drifts are carried. A man will put out about a chaldron per day and for this he is paid $1; timbering costs delivered to the ground 15 cents, oil 5 cents, wagons about $6, picks $1.25, shovels $1. Coal is hauled all the way from half a mile to five miles. Drifts are run in from 300 to 400 feet, when work on them is discontinued. Air shafts have been put in in only one or two places. The hardest and best coal commences at from 3 to 5 miles from the Newcastle wharf and extends from 10 to 12 miles up the river of that name and to Little River, 12 miles distant, in the direction of Fredericton. Mr. McFarlane also thinks that the best coal fields have not yet been touched. He said that Samuel Green is now stripping six feet of earth from off the bed of coal, at which he is working, it being but that distance from the surface of the ground. This bed gives from 18 to 20 inches of good coal. There are places where there are but three feet of earth above the coal for extensive distances. The bed is here 18 to 20 inches thick. He had seen a bed of coal in the locality of Coakley and O'Leary farms which was from 36 to 38 inches thick. A square mile of this has been proved by workings. This, he said, was a solid bed. Much coal has been badly and dishonestly mined by digging the outcrop, which is mixed by earth and pebbles, and is of poor quality. The black shale which underlies the coal is frequently mixed with it, the difference between them not being evident to an unpracticed eye. In working a large bed (36 to 38 inches thick) not more than six inches of earth or shale require to be removed. The tops of the coal beds are generally sound, and there are but few places where these cannot be worked. They rise toward the west, and there are but few faults in them. The day after our arrival here on my hands and with one of the miners went to the face of the bed. The miner said that they usually left 8 or 9 inches to support the propping, as there were about 18 inches of fine clay beneath the bed. These 8 or 9 inches thus left are the most sulphurous part of it. Where we stood was but 12 feet below the surface of the ground. As we were sitting or kneeling in the drift, the miner took his pick and with it broke a piece of coal from the top of the bed; it broke, with a bright, glistening fracture, and appeared to be of excellent quality. This, said he, is the best coking coal. It was from

20 to 22 inches in thickness. For the distance of 12 inches below this the coal is harder and does not show so bright a fracture. By a mixture of the top and bottom, a good steam coal was made, so my companion said. In the afternoon we went to the place where Green was removing the earth from a coal bed having a thickness of from 22 to 24 inches. It was but six feet below the surface. Beneath this is a parting of two inches of shale, where there is another bed beneath it some six or seven inches thick. The men at work here informed us that Green paid them $1 per chaldron for digging this coal and placing it where he could reach it with his teams. Before concluding this short sketch it may be as well to inform the public how coal is mined and delivered on board the schooners at Newcastle. Drifts are run on an incline into the side of a ridge until the coal bed is intersected, and a drain is made to keep the water clear, often an expensive and laborious matter. After the drift has been timbered, which is done as the work proceeds, a track having wooden rails is laid down the incline and up to the face of the bed. By means of small four-wheeled trucks the coal is removed from the bed pushed by hand to the foot of the incline, up which it is drawn by means of a rude windlass where it is dumped on the ground, thence it is loaded on a common wagon having moveable sideboards, the average load for a pair of horses being one chaldron. The load is thence hauled from three to five miles to the wharf at Newcastle, when the sideboards being removed it is allowed to fall to the ground, thence it is again carried by wheelbarrows, containing one barrel each, on board of a schooner lying at the wharf. Three days work of four men is the time ordinarily consumed in loading one hundred chaldrons, the expense attending this must be 25 cents per chaldron. Were there ordinary tramway transport and proper discharging appliances at the lake this sum would be amply sufficient to carry the coal from the pit's mouth and load it on

St. Croix Courier - Oct. 9, 1884 A reporter of a local paper recently interviewed ex-Mayor Jas. H. Ganong with reference to the land at Pennfield lately purchased by St. Stephen and Calais parties, and which, it is claimed, contains rich deposits of silica. Mr. Ganong says 50 bbls. of the mineral has been got out and is now on the way to St. Stephen, where it will be prepared for shipment to the principal machine shops in the United States and Canada to be tested. All who have examined the deposit are certain it is pure silica. It contains a large percentage of oxide of iron. Silica is used in all the machine shops, and it is imported largely from Italy, there being no mines that produce it, as far as the firm can ascertain, in this country. The heaviest deposits appear to be about Black's Harbor, and Sturgeon's Cove in Letang Harbor, which is one of the finest in the world. This is advantageous to the firm, as it will enable them to export the silica in large quantities. The firm is confident it will stand the test, and is worth at cost $10 a ton. If it proves to be what they claim, they will commence operations at once with a force of two or three hundred men."

St. Croix Courier - Nov. 4, 1884 and Daily Telegraph - Nov. 21, 1884 New Brunswick at the New Orleans Exposition.- It was expected that the collection of geological specimens from New Brunswick, in course of preparation by Mr. W.F. Ganong for the New Orleans Exposition, would be ready for shipment the latter part of last week, but a delay of a few days was occasioned by the non arrival of some promised specimens. The collection is now nearly completed and will be shipped in a day or two. As classified, it is a good representation of the economic minerals of New Brunswick. To Mr. Ganong, great credit is due for the labor and time he has expended in preparing the exhibit, as well as to his father, Mr. J.H. Ganong, who will meet the charges of shipment and other expenses incurred. Without their disinterested offering of labor, time and money, the Province would have been entirely unrepresented at what promises to be the greatest display of the kind on this continent during the century. As it is, New Brunswick will make a creditable exhibit in one department, and many, who are entirely ignorant of the Province, will thereby be rendered familiar with its name and one feature of its resources. We append a list of the contents of the cabinet to be forwarded by Mr. Ganong:- New Brunswick at the New Orleans Exposition.- ... Ornamental and Building Stones, &c. Granite:- Dark red, three specimens, polished, dressed and rough; Light red, one specimen, polished; Salmon, one specimen, polished and rough; Gray(Spoon Island), two specimens, polished, dressed and rough - all from the works of Milne, Coutts & Co., St. George. Light reddish grey, one specimen, from the works of H.D. Wallace & Co., St. George. Freestones:- Four specimens, squared and dressed for building; two specimens, dressed for grindstones - all from the quarries of Jos. Read & Co., Clifton, Gloucester County. Whetstone:- Fine-grained, one specimen from Grand Manan, the property of Capt. Pettes. Siliceous Earth:- Two specimens, pure; two specimens with oxide of iron; from Black's Harbor, Charlotte County. Diatomaceous Earth:- Grand Manan. Limestone:- Two specimens, hydraulic and pure, fromFrye's Island; one specimen from South Bay, the property of John Lowry.Slate:- Two specimens, from S. Johnson, St. George. Combustible Materials.-Bituminous coal:- One specimen from Grand Lake. Anthracite coal:- One specimen from Lepreaux. Albertite coal:- Two specimens from Albert County. Mineral Masses.- Serpentine:- One specimen from Frye's Island; one specimen from St. Stephen. Asbestos:- One specimen from Frye's Island. Barytes:- One specimen from Grand Manan; one specimenfrom Frye's Island.Gypsum:- Four specimens. Snowy, anhydrite, selenite, from Hillsborough, Albert County. Ores.- Manganese:- Four specimens. Pyrolusite and manganite.- property of Alfred Markham, Markhamville, Kings County Iron:- Four specimens. Limonite from Grand Manan;hematite, from Woodstock, Carleton County;pyrrhotine, from St. Stephen; pyrite from Frye's Island. Lead:- Galena, three specimens, from Frye's Island, Mascarene and the Elm Tree mine, Gloucester County. Copper:- Bornite, two specimens, Kings County; copper pyrites, four specimens from Kings County: one specimen from St. George; one specimen fromMineral Vale, Kings County; peacock ore, two specimens, Mascarene; copper glance, twospecimens, from the Colonial Copper Mining Company, Dorchester. Antimony:- Three specimens. Sulphuret, 'hard' ore,sulphuret, 'soft' ore; native antimony, from Prince William, York County; one specimen of Sulphuret from Kings County. A few specimens are yet to be added, before the collection is shipped."

Chignecto Post - Jul. 29, 1886 J.H. Ganong, Esq., of St. Stephen has recently purchased a large tract of land near L'Etang Harbor, underlaid with a bed of silica 12 to 40 ft. deep. This is of immense value for many purposes, but it has been recently discovered to have the property of keeping fruit from decay. Apples, oranges, &c., &c., which were packed in it 6 months ago, are today as fresh as when they were put in."

S.J. Globe - Aug. 3, 1886 and St. Croix Courier - Aug. 12, 1886 A Valuable Discovery.- Something More About the Rich Soil that Charlotte Contains (Globe).- Mr. Geo. Roberts was interviewed this morning by the Globe, who heard that Mr. R. had just returned from a visit to the border, where he had been inspecting a deposit of mineral earth which had several noticeable qualities, particularly that of preserving fruit, vegetables, eggs, etc., from decay. Mr. Robertson explained that he had been as far as Milltown, in the matter, but did not visit the deposit itself in its natural bed, which is situated not far from L'Etang. He saw a quantity of the earth at Mr. Boardman's in Milltown, and at Mr. James H. Ganong's in St. Stephen, and he brought a quantity up with him, and it may now be seen at his store, King Street. The deposit seems to have been the bed of a lake, or perhaps the crater of an extinct volcano. There is a surface area of about three hundred acres. Mr. Robertson was told that Mr. Boardman had dug to the depth of twenty four feet, without reaching the bottom of it. The deposit is covered by a growth of moss. In answer to a question as to the qualities Mr. Robertson said that it was first taken up and used as a basis for making paint. Mr. Boardman has a room painted from it. The substance comes out in a solid mass, but crumbles under a slight pressure just as pipe clay does. It is then finer than the finest flour, without the slightest particle of grit. A barrel of it stood in Mr. Boardman's store and a lad put some Bartlett pears in it where they were forgotten and remained some months. On emptying the barrel the fruit came out perfect in size and with taste unimpaired. This lead Mr. Boardman to reflect, and reflection lead to experiment. I have fruits, said Mr. Robertson, which have been preserved for three months, but I propose to carry on a series of experiments for myself on grapes, apples, oranges, and in fish. There is no doubt, whatever, that if future experiments satisfy the experimenters as past ones have that a most valuable discovery has been made. The preserving qualities of the earth are due, probably, in the first place to the fineness that makes it a perfect air excluder, to the absence of moisture; but it must also contain other qualities, for it is an absorbant of the juices and gives no taste to the fruit, yet there is from it a slightly medicated smell. Another of its qualities is that mixed into a paste with paraffine it burns, giving out light and especially heat in quantity. The substance is a buff color, as taken from the surface for a depth of two feet, when it becomes a slightly reddish hue, and it holds a uniformity of this color its entire depth. The public will await with interest the result of the careful verifying experiments which a man like Mr. Robertson will make. He is satisfied himself that the discovery is of the most valuable character, as it will enable fruit to be preserved the year round, and will thus equalize the market. Why, said he in an enthusiastic burst, if it turns out as I expect we will be able to ship eggs to Australia and land them there fresh, and it may be that this will turn out more valuable to us in creating markets than the National Policy."

Codes: G6 / IDX_Names: Bricks - General;

Chignecto Post - Sep. 16, 1886 The Gibson brickyard at Marysville has turned out about 1,700,000 bricks this season, and there is one kiln yet to burn. The yard has given employment to about forty men during the greater part of the year."

S. J. Globe - Sep. 29, 1886 Several of the brick yards have closed down for the season."

S.J. Daily Sun - Sep. 29, 1886 Bricks.- The brick yards of Lee Bros. in Simonds and B. Mooney & Sons in Lancaster have closed down. The first named firm have manufactured about the same quantity of brick this year as last. The output of Mooney & Sons this season was about one million, or double that of last year."

Eastport Sentenil - May 18, 1887 Mr. John Lee of St. John, has a crew of men at work preparing a brickyard here. The site selected for operations is at the Richardson brook, upon land owned by Dr. Jonah, at the head of Hawke's Avenue. Here, water, clay and sand is found upon the spot. A steam brick machine will be put up this week and sometime next week brickmaking will be commenced. The machine will turn out twenty five or thirty thousand bricks per day. It requires about ten days to burn a kiln. Five hundred cords of wood will be used during the season. Mooney Bros. of St. John, will soon fit up the Blanchard yard at the Salt works for brickmaking."

Codes: G6 / IDX_Names: Bricks - General;

Eastport Sentenil - Jun. 8, 1887 B. Mooney & Sons, and John Lee, of St. John, N.B., are manufacturing brick here, the former at the old Mowe brick yard at the Salt Works, the latter in the Hawkes field. At the Salt Works yard about 40 thousand brick are ready to pile up in the kiln. When we visited the yard yesterday, brick making was not going on, the brick machine having broken down. Brick are made here in a way different from that we have heretofore seen. The clay is quite stiff, and the bricks are cut with knives and are at once firm enough to be piled up in tiers 8 bricks high, and in this yard when the machine works well 20 thousand bricks are made in a day. The clay at the Salt Works yard is said to be of excellent quality for brick. In the yard in the Hawkes field business was almost suspended. The clay could not be made into brick with the machine. It would not corner was the given by an intelligent workman, who courteously explained to us the process of making the bricks. They will make the bricks by hand, one at a time, and by this process a man will make

S.J. Daily Sun - Jan. 19, 1888 New Brunswick as a Mining Country. - New Brunswick has never much parade of its mineral wealth, but notwithstanding, the province derives substantial advantage from these possessions. The economic minerals now mined or quarried in the province include coal, gypsum, granite, manganese, lime, grindstones and building stone, antimony, besides some less important substances. None of these minerals is yet worked to any extent compared with the possibilities. The province has no department of mines and no official with authority to collect returns as they have in Nova Scotia. The nearest approach to official statistics are to be found in a report for the year 1886, prepared by Eugene Coste, the mining engineer of the Canadian geological survey. This valuable work is published by Dawson Bros., by authority of parliament. Mr. Coste has been at pains to collect returns from all provinces of their mineral produce and export. The author is not able to tell us much about the coal product of this province owing to the desultory character of mining in New Brunswick. We, or course, know that a considerable quantity is mined at Grand Lake for local consumption in the river districts, and that this coal is used on the New Brunswick railway. It is also sold at St. John. Grand Lake district will next year be put in communication by rail with the outside world, and in a short time will be connected with Montreal, and the coal consuming regions of the west. Then we shall know whether New Brunswick coal fields are rich as has been supposed. The province once exported $100,000 worth of albertite in a year. The census of 1881 credits the Grand Lake district with producing 6,221 tons. We imported in 1886 from Nova Scotia 197,028 tons which at the value given to other Nova Scotia exports would be worth at the place of shipment $375,600. We also imported from other countries 34,845 tons of anthracite, valued at $111,260, and 8,992 tons of bituminous, at a cost of $17,535. It will be seen that New Brunswick has a fine home market. The antimony produced in Canada, comes mostlyfrom Nova Scotia. In 1886, the export of this province was 20 tons valued at $800. It was produced at Lake George, York County. The Rawdon mine in Hants county, Nova Scotia, turned out over $30,000 worth. Of graphite Canada exported $3,586 worth in 1886, all from New Brunswick. The quantity of gypsum produced in Canada has not been ascertained. The exports of crude plaster are givenas 442,833 tons for the Dominion, and 23,498 for this province. The value of the New Brunswick product, nearly all of which goes from Albert county, is $10,559. The quarries on the Tobique river have great possibilities, but are not yet strong competitors with those of Albert county. The total product of the manganese mines in Canada in 1886 is said to have been 4,789 tons, worth$11,499. Of this New Brunswick furnished 4,545 tons, valued at $22,054. The customs statement of export gives a larger value, the foregoing being the estimated worth at the mine. The geological survey people claim to have pretty full returns of granite production in Canada. This gives the total quantity in the rough at 6,062 tons, worth $63,309. New Brunswick is credited with 2,552 tons, valued at $34,509. It is perhaps not very easy to fix the value of the rough stone, but the value of the red granite, as turned out of the polishing works, was in 1886, four times the amount given. Mr. Coste admits his returns of other building stones to be incomplete. He has heard from producers of $??? Of value and it appears that this represents from three to four fifths of total output. Three returns from New Brunswick give 2,728 tons, worth $24,970. His return of the produce of lime quarries as also admittedly incomplete. The total amount heard fromat the statistical office was valued at $283,756. New Brunswick's share being $58,120. New Brunswick is the only province which produces lime for export. Mr. Coste returns includes brick, concerning which he has fourteen reports from New Brunswick disclosing a product worth $30,908. Four quarries in Gloucester County report an output of grindstones to the value of $22, 495. From above returns it would appear that New Brunswick stands well, both in respect to variety and quality of mineral resources. Our coal supply is only beginning to be available. The red granite industry hasbeen doubling its product every three or four years. Lime quarries have been for the past four years doubling their operations every year. The plaster export of 1886 was 50 per cent larger than in the preceding year, and fifteen per cent in excess of any previous year. The construction of the Tobique railway to Plaster Rock will bring a new field into operation. New investments were made last year in manganese properties, and it is probable that the work now in operation will be extended. The exports in 1886 were only exceeded in value by that of 1885 and that of 1880, while that year's sales were probably in excess of any previous year. The total value of mineral export from New Brunswick to foreign countries in 1886 calendar year is given by the customs returns at $101,349. The actual amount of sales outside

Fredericton Capital - May 12, 1888 Marysville Brick Yards. - The yards are being got in readiness for the manufacture of bricks, and operations will commence in a week or two. Mr. Gibson contemplates erecting a large number of brick buildings this summer for the operatives, and the manufacture of bricks will, therefore, be carried on more extensively than for two or three years past. Last year about 700,000 bricks were manufactured. This year it is expected that the number will exceed one million."

Codes: 0691 / Z2 / G6 / G3 / LIME / Z2 / GYP / IDX_Names: Markhamville Manganese; Sandstone, Building Stone, Monument Stone, etc.; Bricks - General; Granite; Lime - General; Sandstone, Building Stone, Monument Stone, etc.;

Moncton Daily Transcript - Oct. 2, 1888 The mineral possibilities of New Brunswick are greatly underestimated; and the time is not far distant when, as a source of wealth, they will be energetically developed. The statistics of output of minerals last year, are imperfectly collected, and no adequate conception of the output is at hand. The statistics collected by Mr. Eugene Coste, of the geological survey, such as they are we give. He places the mineral output in New Brunswick last year at the following rates: - Quantity ValueGrindstones… 3,582 tons $38,938 Arsenic… 100 pounds 4 Coal… 10,040 tons 23,606 Copper… 2 tons 200 Graphite… 300 tons 2,400 Gypsum, crude… 29,102 tons 29,266 Manganese… 939 1/2 tons 21,260 Granite... 6,289 tons 15,125Building stone (3 returns)... 6,871 cubic yards 52,901Lime... 478,410 103,463Brick, thousand... 6,476 43,454 – Total value... $330,667 The estimate is altogether too low. The output of grindstones and building stone are absurdly low. The output of granite is placed at $15,125, whereas $100,000 worth is known to have been shipped to the western provinces. The matter is an important one, and the bureau of statistics should

Evening Gazette - Aug. 14, 1889 and Daily Telegraph - Aug. 16, 1889 A New Brunswick Industry. - (Bangor Commercial) - Hon. David McLellan, one of the most prominent gentlemen in New Brunswick was in the city today on a flying visit. He came through to Orono on a business trip of a somewhat peculiar nature. It seems that Mr. McLellan is one of the leading members of a large company which has been formed to take the moss from a great bog near Musquash Station, N.B., and ship for commercial purposes. The scheme originated some time ago and the moss has already been used to quite an extent for bedding and other purposes. It is eleven feet deep in the bog and one of its peculiarities are that it will absorb 100 per cent of water or far more than a sponge. Of course it has to be thoroughly dried before it can be shipped and one of its peculiar properties is that when it is dry it will not burn. Quite a business has already sprung up bringing the moss litter from Germany into New York and the Province men propose to compete with them. They have a great demand for the product and Mr. McLellan says that if they had 10,000 tons of the moss ready for shipment they could dispose of it at $10 per ton. He came to Orono to look at the sawdust press at F.W. Ayer & Co.'s mill and they intend to purchase some of the presses of the Maine Compress company to use in their moss bailing business. The recent bonanza found at the bottom of an Eastern Maine pond and this big enterprise show that the seemingly useless parts of this great eastern country can all be utilized."

Daily Times - Sep. 27, 1889 Brick Making. - The Extensive Works of the Messrs. Flett on the Miramichi. - The Chatham Advance contains a description of the extensive brickyards of the Messrs. G.A. and H.S. Flett. Their principal place of business is at Nelson, where the plant of the works consists of an upright boiler and engine, which does the pumping and works two machines of the most approved type. These are also two pressing machines. The yard has a drying capacity at present of 250,000 bricks and 500,000 can be burned at one time. The working capacity is 15,000 a day for common and 6,000 per day pressed. Fifteen men and some boys are employed in the yard and they are paid once a month. A few weeks since Messrs. Flett purchased the extensive brickyard at Napan, owned by the Maritime Chemical Pulp Company, where the bricks for the Pulp Mill were made. It turned out from 20,000 to 22,000 bricks a day, employing about twenty five men. The output of the Napan yard is hauled to Chatham railway station, about a mile distant over a level road, or to the wharf at Chatham. Messrs. Flett have also the property known as the Boss brickyard at Bathurst, which is alongside of the Intercolonial Railway, about a quarter of a mile south of the station. Here they have always a quantity of bricks on hand for northern points, the product of the season being about 175,000. The firm's manufacture for the present season will be about 1,000,000 bricks. To give an idea of the bulk represented by that number we may say that they would build a wall a foot thick, ten feet high and more than a mile long. They go to different points in the Maritime provinces, largely to contractors for government works at Sydney, Pugwash, Wallace, Tatamagouche, Moncton, Campbellton, Dalhousie, etc., besides those entering into local consumption. The Napan works are now engaged making bricks exclusively for Messrs. Rhodes, Curry & Co. who are using them for a round house at Moncton. Mr. Harvey Flett, who is the junior member of the firm, has been fourteen years at the business here and in the United States. He began seven years ago at Nelson and, after a time, formed a copartnership with his brother. The growth of their business bears testimony to their well directed enterprise and practical knowledge."

S.J. Daily Sun - Oct. 19, 1889 The Mines of Canada. - New Brunswick does not take a conspicuous position in Mr. Brumell's returns, but still makes a respectable showing. Here are the items with the values as far as the returns enables the New Brunswick product to be separated from that of the other provinces. Value Grindstones ... 3,793 tons $30,729 Coal ... 5,730 tons 11,650 Graphite ... 150 tons 1,200 Gypsum ... 44,369 tons 48,764 Plaster of Paris ...50,000 bbls 31,000 Manganese (exported) ... 1,181 tons 16,073 Building Stone ... 1,953 yds 19,680 Lime ... 440,225 bush 82,993 Bricks ... 5,064 m 32,294 The statement does not include granite, which for the whole Dominion is valued at $147,305. This may be a fair statement of the value of the rough stone but it is far below that of the polished granite produced in this province alone. The returns of lime produced in the province are evidently incomplete. The New Brunswick lime exports for the year are stated at $97,318, and the value produced was, of course, considerably larger. Adding to the $300,000 credited to New Brunswick by Mr. Brumell the value of granite produced, we find that the mineral product of this province is considerably over a dollar per head for our population."

Codes: G6 / IDX_Names: Bricks - General;
S.J. Daily Sun - Nov. 16, 1889 The brick business. - The number of bricks manufactured here this year has been very large. In addition to supplying our own wants in this line, quite a lot have been shipped. Lee & Co. burned about three and a half millions, and Mooney & Sons over two millions."

Daily Times - Mar. 7, 1890 A Valuable Substance. - The Truro Sun says: It may not be generally known that the bottoms of several lakes in Colchester County are taken up under the mining act but such is the case. Folly Lake, Londonderry, and Snare Lake, New Annan, are among those taken up. The object in doing so is to monopolise a kind of sediment that lies at the bottom of these waters. It is a whitish substance finer than chalk, and while wet it can be compressed into bricks. It is said to be one of the most valuable silver and gold polishes yet discovered, there being no grit to scratch or injure these wares. It is also said to be superior to asbestos as a lining or covering for locomotive boilers. We are reliably informed that one end of a brick, six inches long, may be placed in a fierce fire and left there for any length of time without the other end becoming even uncomfortably warm to a touch of a hand. The lakes above mentioned are said to be prolific in producing this substance. Quite a large amount of it has been already shipped to New York and other places."

Moncton Daily Transcript - Apr. 11, 1890 District Geology. - Mr. Chalmer's Work in Westmorland and Adjoining Counties. - The latest report of the Department of the Interior states that Mr. Chalmers, of the Geological Survey, was engaged during the summer in studying the superficial deposits of southern New Brunswick, including the counties of Kings, Albert and Westmorland. The survey of the surface geology of this area is now completed, at least so far as the nature of the country will admit of such being done in detail. Considerable portions are still unsettled and in a wilderness state, and in these of course, the study andmapping of the surface deposits could only be done in avery general way. Maps and reports with reference to thisdistrict are being prepared. Mr. Chalmers further reportsas follows: The glaciation of the eastern part of the area in which lies the north eastern extension of the ridge or plateau bordering the Bay of Fundy, was investigated with some care, and facts of much interest discovered. This ridge forms a prominent feature in the landscape, being higher than any other part of the country except the northwestern highlands or the Gaspe Peninsula. Here, therefore, we might naturally expect to find traces of a continental glacier, if such ever swept over the eastern part of New Brunswick. None were observed, however; on the contrary, great masses of decayed rock in situ encumber its northern and northwestern flanks, while along the valleys of rivers descending from it northwardly into the Petitcodiac striae were found clearly indicating northerly ice movements. Along the Petitcodiac valley, however, which lies below the 200 feet contour line striae were seen to follow its course, showing ice movements in an easterly direction. It is evident that local glaciers and icebergs were amply sufficient to produce all these phenomena. On the summit of the Bay of Fundy ridge or plateau referred to, local areas which served as gathering grounds for glaciers sent some of these off towards the Bay of Fundy. A large number of facts relating to the glaciation of this district will be given in the annual report. District Mineral Resources. - In the enumeration of the mineral resources of this section, Mr. Chalmer's report says that brine springs are found at Sussex, at Salina, on Salt Springs Creek, and at Bennet's Brook, near Petitcodiac. At Bennett's Brook nothing has been done to utilize the springs there, to his knowledge. In all these places the brine contains a considerable percentage of sulphate of lime or gypsum. There appears to be less, however, in that of the Sussex springs than at Salina or Bennett's Brook. Medicinal springs are met with at Apohaqui and at Havelock Corner, Kings Co. The Havelock mineral water has, for some years, held a local reputation as a remedy for certain diseases; and as an extensive deposit of mud surrounds the spring, it might be utilized for the establishment of mud baths, which are said to be beneficial in the treatment of some diseases. Infusorial earth has been reported at Pollett River, Kings Co. Subsidence of the marshes. - Mr. Chalmers further says: I visited the Ship Railway now under construction across the Isthmus of Chignecto. In an excavation which is being made for the docks in the salt marsh at its western end, the following series of deposits is disclosed;- (1) marsh mud, 5 to 10 feet; (2) fine grained, stratified blue clay, holding numerous shells - thickness, from a few inches at one end to five to eight feet at the other; (3) peat or humus, six to fifteen feet thick, containing roots and stumps of small trees, chiefly haematae, and in some places portions of the stems. This peat or forest bed evidently grew on a sloping bank at the border of a lagoon or quiet inlet. The lowest part of it is now twenty feet or upwards below the level of high tides in the Bay of Fundy. At Aulac station, Intercolonial Railway, which is on the great Tantramar salt marsh, a boring 305 feet deep, was put down under the direction of P.S. Archibald, chief engineer, Intercolonial Railway. This boring shows likewise (1) marsh mud, eighty feet; (2) turf and bog; (3) red clay, &c. These facts clearly establish the conclusion that a subsidence has taken place here since the growth of the peat beds, and

Evening Gazette - Jul. 8, 1890 Fire Bricks. - Some parties are now making arrangements to commence the manufacture of fire bricks at Little River, Grand Lake. The move will no doubt be a profitable one if the parties understand how to make the bricks properly, for the fire clay in that vicinity is of excellent quality and can be obtained in abundance at small cost. There is a nice little harbor opening on Grand Lake at Little River, which is only a few miles below the Newcastle coal region, giving good chances for cheap shipment. About 15 or 20 years ago Messrs. Temply & Annett engaged in the making of fire bricks at Little River, but owing to several causes they were not successful in the business. Their bricks, however, were good for some of them which have recently been put in a furnace have, even after being exposed to the weather for 15 or 20 years, stood the test as well as the imported article. A large quantity of fire bricks is imported to the provinces every year, from England and Scotland which sell at prices ranging from $25 to $40 a thousand. About 100 tons of the Grand Lake fire clay is used in St. John every year in repairing furnaces. The clay generally sells at about $3 a ton, so that if the bricks are made so as to answer as well as the imported article it will be seen that the making of good fire brick ought to be a profitable industry."

St. Croix Courier - Apr. 7, 1892 Minerals of New Brunswick. - Extracts from a Paper by Prof. L.W. Bailey, of the Geological Survey of Canada. - COPPER. - The ores of copper found in New Brunswick include native copper, copper glance, chalcopyrite or copper pyrites, bornite or erubescite, cuprite and malachite. NATIVE COPPER has been reported as occurringsparingly in connection with the basalt traps which form the northern half of the Island of Grand Manan. It hasalso been observed at Clark Point on the Mascarene shore of Passamaquoddy bay, and it is stated to have been found in small quantities along the coast, near the head of the Bay of Fundy. Little that is definite, however, is known of either locality. COPPER GLANCE accompanies the native copper in the traps of Grand Manan, where it has been found in small quantities of Grand Manan, where it has been described by Prof. E.J. Chapman as being sufficiently abundant to give promise of profitable extraction. Little effort, however, has as yet been made in this direction. The same mineral, and in larger quantities, has been found associated with other copper ores at different localities along the coast of Charlotte county, and on the adjacent islands among which may be mentioned Crow Harbor Island, Simpson's and Adam's Islands. It is,however, a less abundant mineral than the species nextdescribed. COPPER PYRITES OR CHALCOPYRITE is the most widelydistributed as well as the most abundant of the copperores of New Brunswick, and has been observed at many localities. The larger number of these occur along the southern seaboard, where a band of copper-bearing rocks, believed to be of pre-Cambrian age, is found to extend, with some interruptions, along the greater part of its length. Others are found in the interior, more particularly in connection with the older schistose rocks or the intrusive masses by which these have been invaded. A detailed list of these localities so far as they occur in the southern part of the province, will be found in the Report of Progress of the Geological Survey for 1870- 71. In the northern part of the province, the most noticeable localities are Bull's Creek, in the vicinity of Woodstock and the Tattagouche River, near Bathurst. InWestmorland county, ores consisting in part of this species occur in connection with rocks of the carboniferous age, near the town of Dorchester. BORNITE OR ERUBESCITE, sometimes known as peacock ore, accompanies the other ores of copper, more particularly about Passamaquoddy bay and the head of the Bay of Fundy, sometimes occurring to the exclusion of other varieties. Where abundant, it constitutes a very valuable source of the metal, and the ore of some of the most promising mines yet opened has been chiefly of this species. NICKEL. - Considerable deposits of pyrrhotitehave for many years been known to occur in different parts of Charlotte county, usually in connection with copper pyrites, but until recently have been considered to be without value. Attention, however, having been redirected to them in consequence of the developments at Sudbury, in Ontario, these have also been found to be nickeliferous, and attempts are now made to test their value. The deposits appear to be large, but, as at Sudbury, the nickel contents vary considerably. A fair average sample of 75 lbs., analyzed under the direction of Dr. Hoffman, of the Dominion geological survey, yielded nickel, 4.718 per cent., the material very closely resembling, according to Dr. Hoffman, a large proportion of the ore at Sudbury, Ont. BUILDING STONES. - Very extensive and valuablebeds of granite, freestones, slate, marble, etc., existsin the province, and in the case of the first two have been largely quarried for exportation, but have not beenthought to require extended notice in the presentconnection. The same is true of another of the rocks or minerals, including limestone, clays, infusorial earths, bog-ores, salt, &c. These may be made the subject of a subsequent contribution. LIMONITE. - In addition to the limonite referred to above as associated with the hematites of Carletoncounty, this same mineral is found at various localities in the form of bog ore. The largest deposits are upon the banks of the St. John river at Burton, in Sunbury county, and considerable quantities of the ore were removed during the continuance of operations at Woodstock, for admixture with the hematites of that locality. Spathic iron is only known to occur in the form of small veins in certain parts of Queen's and Charlotte counties. At West Beach, twelve miles east of the city of St. John, upon the shore of the Bay of Fundy, are beds consisting of red hematite mingled with specular iron ore, while at Black River, two or three miles east of West Beach, some of them with a thickness of 20 feet. They have not, however, as yet attracted the favorable notice of such iron experts as have visited them. Magnetite is not uncommon in the form of scattered grains in the crystalline rocks of the southern counties, and small veins are

St. Croix Courier - Apr. 7, 1892 Minerals of New Brunswick. - Extracts from a Paper by Prof. L.W. Bailey, of the Geological Survey of Canada. - COPPER. - The ores of copper found in New Brunswick include native copper, copper glance, chalcopyrite or copper pyrites, bornite or erubescite, cuprite and malachite. NATIVE COPPER has been reported as occurringsparingly in connection with the basalt traps which form the northern half of the Island of Grand Manan. It hasalso been observed at Clark Point on the Mascarene shore of Passamaquoddy bay, and it is stated to have been found in small quantities along the coast, near the head of the Bay of Fundy. Little that is definite, however, is known of either locality. COPPER GLANCE accompanies the native copper in the traps of Grand Manan, where it has been found in small quantities of Grand Manan, where it has been described by Prof. E.J. Chapman as being sufficiently abundant to give promise of profitable extraction. Little effort, however, has as yet been made in this direction. The same mineral, and in larger quantities, has been found associated with other copper ores at different localities along the coast of Charlotte county, and on the adjacent islands among which may be mentioned Crow Harbor Island, Simpson's and Adam's Islands. It is,however, a less abundant mineral than the species nextdescribed. COPPER PYRITES OR CHALCOPYRITE is the most widelydistributed as well as the most abundant of the copperores of New Brunswick, and has been observed at many localities. The larger number of these occur along the southern seaboard, where a band of copper-bearing rocks, believed to be of pre-Cambrian age, is found to extend, with some interruptions, along the greater part of its length. Others are found in the interior, more particularly in connection with the older schistose rocks or the intrusive masses by which these have been invaded. Woodstock Dispatch - Jun. 5, 1895 New Brick Yard. - Pike Bros., who have been operating a brick yard at Kilburn, have moved down to Grafton and have opened a yard on Enoch Campbell's farm. They employ 10 hands and mould about 10,000 a day. They have now stacked up about 90,000 bricks. Their first kiln will be ready for market on the first of July. Though late in getting to work they will turn out from 6 to 7 hundred thousand this season. They have a good machine that moulds 10,000 bricks a day with horse, power and with steam it would mould 12,00 to 13,000 a day. The bricks are carefully taken from the moulds and stacked up, instead of being thrown on the ground to warp, and thus a good even brick is turned out, quite equal to the Fredericton make. Pike Bros., have good banks of clay and sand at their disposal that will last fifty years. This is the only brick yard nearer than Hartland."
S.J. Daily Sun - Jan. 14, 1896 Sussex News. - Another Brick Yard. - Sussex, Jan. 13. - It is among the possibilities that another brick yard will be opened here before long. An excellent body of clay and suitable for the making of brick, drain tiles and other articles usually made in a first class establishment have been found in a field owned by John D. Whalen in rear of the dominion building."

Daily Sun - Jan. 10, 1899 Peat Moss. - Alderbrook Farm, St. John, N.B., Jan.9 Col. Alfred Markham, Manager Sun Printing Co.: Dear Sir - I have a peat moss bog on my farm of about 50 acres in extent. I understand such bogs are quite common in the northern half of North America, so my experience may be of interest to a number of your readers. These bogs are usually called barrens. I think one dollar spent on mine will bring more and better crops than tenon any other land in its natural state that I have. The bog seems to have a saucer-shaped white clay bottom; on the surface each year grows moss in small hummocks; below is the moss that is so well known as German moss litter, a grand deodorizer, wonderful absorbent, that contains as much nitrogen, ton for ton, it is claimed, as the best stable manure. The bedding moss runs from an inch deep at the outside to a depth of 12 to 15 feet towards the centre of the bog; between it and the clay is the black rotted moss or peat. Last May I mowed the blueberry bushes by hand, tore the hummocks of living moss off with a spring tooth cultivator, going over it twice to get a smooth surface, and took the loose moss to the barn for bedding. Then with a simple tool, I cut out drains 22 inches apart, and put the moss from them away, after drying it on a rock shaped like a turtle's back, for this winter's bedding. I had eight lands, 300 feet long by 21 feet wide. I dressed them all with refuse lime fresh from the kiln, and some with manure as well. The lands with lime gave but a poor crop, but with lime and manure I had as good a crop of oats and peas, buckwheat, grass and clover as I have ever seen. All I put in during May I cut green; some I put in on the 16th of June matured timothy seed with a 30 inch stalk and a 2« inch head. Mature timothy in a little over three months beats all records I have ever heard of in this locality. My bog never overflowed, even before I put a main drain into its borders some four years ago; so I do not know that it needs small drains at all. I have put up a land 120 feet wide this fall, and if it works well I do not expect to bother with any more than

three or four large drains (that can be dammed in the dry time of summer) in the whole 50 acres. I seeded down an experimental plot in September with eight kinds of winter wheat, four kinds of rye, three of oats and one of vetches. They are now under the snow looking well. In the Country Gentleman of Nov. 17th (page 905) a correspondent tells of feeding peat meal. I would like to hear further of this, as I have thought the top moss has a food value. When I add that the peat is now made into a fuel the equal of coal by a machine invented by an Upper Canadian, I think you will agree with me that the name Barren, as applied on those moss bogs, is a misnomer. I expect to push my experiment of growing a higher on a lower form of vegetable life this coming summer, and would like your advice, particularly with regard to drainage and manures, or how best to grow crops on a peat moss bog. Very truly yours, Ernest H. Turnbull."

N.B. Courier - Nov. 18, 1837 LETTER VII. To His Excellency Major General SirJohn Harvey, K.C.H. and C.B., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency: In closing the communications I have had the honor of laying before your Excellency, I beg that I may be permitted to introduce some information obtained by others whom I had the pleasure to accompany on an excursion across the country towards Richibucto; and although the facts there collected are not wholly of a geological nature, their relation may not prove altogether useless and uninteresting to such as feel an interest in the welfare of the country. Our party consisted of Captain Egerton, Mr. Levinge, and the Hon. Mr. Cholmondeley, of the 43rd Light Infantry, M.H. Perley, Esquire, and myself, with five Indians hired for the purpose; namely, John St. Baptiste, Lewis Paul, Martin Paul, Sacobee Ottowin, and Joe Lola, each with a light bark canoe. Our departure was 7 taken from St. John on the 16th of August, and we arrived at the head of Grand Lake, in the Woodstock, steamer, in the evening of the same day. The party, excepting myself, was abundantly supplied with the instruments of death, and much time was spent in examining fishing tackle, salmon spears, fowling pieces, rifles, &c., which, when arranged along the deck, gave the boat a very warlike appearance. A large leather bag, pickaxe, and hammer, were insignificant objects beside the polished steel of my companions in arms, and among the often repeated sounds of bears, moose, cariboo, salmon and trout, the desire of finding a gold mine was seldom mentioned. Had the beasts of the forest and the fish of the Richibucto, have beheld this dreadful array, or known the determined resolutions for their destruction, they would have forsaken their native haunts, and fled from before their approaching foes. And such seems to have been the fact, for few of either tribe suffered by our advance upon them. The following day we embarked in our canoes, and proceeded eleven miles up the Salmon River, to a place called the Forks. In this distance the sandstones of the coal measures are the only rocks to be seen. There is a singular mound of fine sand thrown up on the south side f the river. Its elevation above the general level of the country gives it the appearance of an ancient fortification; but no relics were discovered to explain its history. The whole surface of the country around this place is not more than fifteen feet above the level of the lake, and viewed from the highest eminence appears like an extensive prairie, covered with a dense forest of spruce. The river flows along a crooked bed, skirted with rich intervale, and studded with majestic elms, whose broad shadows on the water were truly delightful as we paddled beneath the long umbrella spread over the way. Thus far the Salmon River is deep and tranquil, and not more than a hundred and fifty yards wide, abounding in lilies which were so numerous in some places as to resist the progress of our frail barks. Having ascended a considerable rapid above the Forks at the close of day, we landed, and the Indians in half an hour, erected a camp large enough to give longitudinal accommodation to ten persons. After a hasty supper torches were prepared, and all hands equipped for spearing salmon. In the darkness of midnight, our Nautilus fleet was launched, each canoe with a flaming torch hoisted at its prow. The long handles of the spears served to force the barks up the foaming rapids, into which the adventurer should always be prepared to slide, for altho' he may understand the art of balancing, and the laws of gravitation erfectly, an Indian canoe will sometimes demonstrate a new problem, and plunge him head-foremost into the stream. The river illuminated with brilliant lights, darting from side to side of its banks, and flashing upon 8 the polished steel, afforded a truly savage spectacle, while the hopes of striking a fish, and the expectation of being every instant compelled to dive, produced a little nervousness even in the Indians themselves. For this kind of amusement we were abundantly prepared, and it was conducted in true native style, only one thing was waiting to render it complete - but one salmon could be found. On the morning of the 18th, we parted with Messrs. Cholmondeley and Levinge, who entered the forest on the west side of the river, with old Sacobee, and Joe Lola, in quest of cariboo. They were several days in the woods without meeting with any game, and they returned with the solitary pleasure of having attacked and fairly beaten a large she bear and several cubs. Some fear had been expressed that these gentlemen would not endure the hardships of such a journey, but they returned in excellent health, having been much gnawed and stung by flies and musquitoes. With our lessened numbers and baggage, we then made a portage across the mill dam of John McAllister, Esq. Here the sandstone is exposed, and its strata may be seen having a gentle inclination to the northeast. Six miles farther up the river we landed to examine a mineral spring near a small collection of sand called Cast Away Island. The water of the spring flows from the coal measures, and will fill a hogshead every fifteen minutes. It has a very unpleasant odor and taste, and having been reported to be medicinal, a quantity wasafterwards brought away and analysed. The Indians seemed to think it poisonous, as they could not be prevailed upon to drink any quantity. I drank a pint from the fountain, and discovered that the water was gently sperient. By analysis it was found to contain in sixteen fluid ounces, Carbonic

acid, Sulphuretted Hydrogen, Sulphate of Magnesia, grains, 4 Sulphate of Soda, grains 19.5 Oxide of iron, grains 4 It therefore differs but little from the sulphurous spring of Cheltenham, and will be found very efficaceous in cutaneous eruptions, and a variety of other disorders. The above analysis may not be found strictly correct as the salts in the water might have entered into new condunations before I had the opportunity of applying the proper tests for their discovery. Ascending the stream the interval diminishes, and the river runs along a smooth channel worn out of the sandstone; wherever the soil is sandy there are groves of pine and numerous wild flowers - the rose and the honeysuckle were seen blooming on the side of the unfrequented stream. A black dragon fly was found here differing from any I had seen, and other species are remarkable for the beauty of their colors. Several miles 9 above the Springs, a bed of the yellow oxide of iron was discovered - it would yield an abundance of ochre forpigments. From the increasing shallowness of the water, and violence of the rapids, our progress was greatly impeded, and we halted in a grove of pines for the night. We required not the skill of a French cook to prepare our supper, when the appetite is sharpened by labor, and abstinence, even the hasty preparation of the Indian is received without any scrupulous enquiry respecting its absolute cleanliness. With our heads under our canoes and our feet opposite a great fire, we would have slept; but myriads of musquitoes trying to find soundings on our faces, rendered the labor of the night greater than that of the day. Several kinds of ointment were tried in vain, and it was impossible to wind a blanket around the head so tight as to admit of respiration, and keep the winged insects off. The natives suffered equally with ourselves, and nothing but a suffocating smoke had any effect upon these flying and singing armies. At sunrise next morning we again embarked and commenced scaling the stream with renewed vigor. Nothing can exceed the stillness and gloom presiding over the water between the rapids, which are often three miles apart. The sound of the bugle is delightfully re-echoed in the windings of the river, and often did our red brethren beg for a tune on the pee pee-quat. - The course of the stream is about northeast, and forty miles from Grand Lake it will average thirty yards in width. There is a sameness in the scenery that foils the memory and sets description at defiance. As far as vision extends, in every direction the surface presents one vast level tract, in many places occupied with groves of pines and towering hemlocks. Not a rock can be found, but such as belong to the coal series; these, when there are depressions in the strata, are covered with beds of sand and clay; of the latter there are collections of different colours, and such as are well adapted for the manufacture of the finest porcelain. One particular spotwas pointed out by old John, our guide, as favorite resort of the cariboo, and the natives have a tradition that that animal has long frequented this particular place to obtain something from the earth - probably asmall quantity of salt. The alcedo or kingfisher, only observed occasionally in any climate, is common on the Salmon River, and was seen constantly plunging into the water, and destroying great numbers of small fish. This bird was the halcyon of the ancients, who in the age of fable ascribed to it remarkable powers. Aristotle and Pliny have said that during the time of its sitting the mariner might pursue his voyage in safety, hence those days were called the halcyon days. Two kinds of the smallest wading birds, were seen upon the shores, and on the plains the 10 pigeons are numerous during the season of incubation, and when the whortleberry is ripe. The following remarks have been extracted from the Journal of Mr. Perley, who with Capt. Egerton, pursued the route to a greater distance than my time would allow. He says, ""the borders of the upper part of the Salmon River were found to consist of low land, with much meadow covered with alder. Below the 'Oxbow', where the river bends off very suddenly to the southward, we passed a number of short angles. Above, the water became deeper, and more placid. The river is here about thirty yards wide, and many tall pines on its banks, fling their broad shadows upon the deeply colored waters. Before arriving at the portage we noticed several extensive beds of clay, and red, and yellow ochre, on the sides of the river; but no stone of any description. At 5 p.m. we made up our packs, in a violent thunder storm attended with rain, and set out over the most dreary tract of country we ever beheld. The land between the Salmon River and Richibucto is very swampy and has been burnt over not many years since. The ground is completely covered with windfalls of all sizes, so that the portage path was blocked up. In three hours we had advanced only two miles, when we reached a thicket of green wood and encamped for the night, under torrents of rain. The Indians exerted themselves with great spirit, and notwithstanding all our clothes and blankets had been wet, since they were turned into the river by the upsetting of a canoe, and the rain had again given them another ablution, we slept soundly before the blazing fire. The bright sun of the next morning awoke us, and having cleaned our guns, and breakfasted, we followed a tolerable path to the distance of a mile, when we arrived at the head of the Richibucto. This river at the place where we first floated upon it, is about ten yards wide, having a gravelly bottom, clear water, and an abundance of small yellow trout, quite different from those taken from the water flowing into the St. John. The stream runs through an alder meadow, and groves of pine, spruce and elms, are seen only in the distance. At 2 p.m. the Indians returned from Salmon River with the canoes, and a more laborious task could not have been performed by men. After our embarkation the water was so shallow and the rapids so frequent, that our progress was slow, and at night we halted only six miles below the portage; in this distance the forest is composed of pine and fir, almost exclusively. The night being fine, we slept under the shadow of our canoes. Advancing down the river on the following day, the banks were carefully examined, but no rock could be found except the grey sandstone, identical with that of the Salmon River. Near Smith's Mill we opened a pretty settlement, the first we had seen on this side of the portage; the canoes and baggage were carried around the dam, which is one mile from the head of the 11 tide, and twenty six miles from the town of Richibucto. We here spent a large portion of the day in fishing, and I never met with a spot so well deserving the visit of the angler. In four hours we killed two hundred splendid sea trout, many of which were of 2 and 3 lbs. weight. These fish are shorter and thicker than the lake trout, and have a much brighter and more silvery hue. They are also stronger and when rising at the fly almost always throw themselves entirely out of the water, and seldom miss being hooked. With the ebb tide we dropped down the river, which gradually becomes wider, and runs between horizontal layers of sandstone. The soil (evidently the debris of the underlying rocks), is light and sandy.

There are here many promising farms, and the fine fields of grain were strongly contrasted with the desert we had passed through. Below the mouth of the South, or Mill branch, the Richibucto opens into a wide handsome river - or what might be more properly called an arm of the sea; passing down, we noticed that the banks are composed of grey sandstone, passing into red, all laying into horizontal strata. Those rocks form a number of cliffs, in which the sea has worn numerous holes, and caverns, exhibiting a great variety of fanciful shapes and figures. We encamped below the Molus River, and the following day reached Richibucto, where, notwithstanding the forbidding appearance of our soiled Indian dresses, we enjoyed the kind of hospitality of W.J. Layton, Esquire, and other respectable gentlemen."" As I have already far exceeded the limits originally intended for these letters; I regret that I am unable to detail all the useful and interesting information gained by the indefatiguable exertions of Mr. Perley, on his return from the North Shore of the Province; and therefore I hope he will give a more elaborate account of it from his own pen. That gentleman and Captain Egerton were fifteen days on the tour; they encamped in the woods twelve nights, and were exposed to some very unpleasant weather, which, however, did not prevent them from returning home in perfect health, and in good spirits. The Indians also endured their hardships without a murmur, and were delighted with a tour so congenial to their natural habits. They are very intelligent, but less athletic than the Micmacs of Nova Scotia; their dialect differs much in some particulars, although these different tribes can generally understand each other. The Micmac of Nova Scotia calls a canoe Talactic - the Milicete of New Brunswick applies to it the word Pa-que-dan. The following are a few nouns of the latter race: Pessqua-haut Axe .... Tom-a-ha-gom Knife .... Me-go-da-nis Salmon spear .. Neck-an-gull 12 Tea kettle .... Check-lock-qe-gun Indian purse .. Patch-nau-goe Bugle .... Pee-pee-quat Paddle .... Ta-han-gen RIVERS Loosh-tork, } (The St. John) } the long river Magaguadavic the river of hills Oromocto the deep river Nashwaak the rapid river Nashwaak-sis the little river of rapids (sis being the Indian dimunitive) Richibucto the river of fire, or river of the burnt country Miramichi the happy retreat Restigouche the ..?.. river Pokiock the frightful river A lake is called quis-pam - a river, seep - brook, seep boo-sis. A doctor is denominated noo-chein-peel-wot. I observed that they called me noo-chein peel-wot pe-nops. Penops signifies stone, hence they implied a stone hunting doctor. Before I take leave of your Excellency, I beg to remark that the letters now concluded, have been prepared for the Press, amidst other and constant employment. A few typographical errors could not be corrected, in consequence of my distant residence from the publisher. Of the importance of obtaining an accurate Geological knowledge, and unfolding the mineral wealth of the Province, it is unnecessary for me to advance a single argument. My only object has been to render my favorite pursuits as useful to mankind as possible, and with the least degree of success I am satisfied. The kindness I received from all classes of the inhabitants during my visit among them claims my warmest acknowledgements. I am much indebted for the kind permission received, to address these letters to Your Excellency, and sincerely hope they prove interesting to one whom the loyal sons of the British Colonies in America justly delight to honor, and whose elevated character needs no encomium beyond the affections of the people. I have the honor to be Your Excellency's most obedient and humble Servant, A. Gesner. Parrsboro, Nova Scotia, } Oct. 17th, 1837 }"

S.J. Daily Telegraph - Oct. 30, 1847 ADVERTISEMENT: Tenders Will be received by the subscriber, until Wednesday the 10th day of November, for making 200,000 Brick at Lane's Creek, parish of Woodstock, for the Iron Works about to be erected at that place. Good clay and sand may be found on the spot, and every facility afforded for the making. - The Bricks to be 9 inches long, 4 1/2 inches wide, 2 1/4 inches thick, and to be in readiness for delivery on the 1st of June, 1848. -Also-2,000 cords of good hardwood, in lots of 50 or 100 cords each, to suit different persons, to be delivered on or before the 1st of May, 1848. 3,000 barrels of Charcoal, in lots from 10 to 100 barrels each, to be delivered on or before the 1st of September, 1848. Also - Refuse and Merchantable Lumber, of various kinds - Tenders to express the price per thousand feet. Scantling of various dimensions, as may be required - proposals to express the price per Thousand feet, to be delivered when required, after the 1st of March next. All the above articles to be delivered on the Company's premises in Woodstock, as specified above. Satisfactory security for the due performance of the above Contracts will be required. Further particulars made known on application to W. Stevens, Agent. WOODSTOCK, October 23, 1847."

Morning News - Apr. 19, 1850 ""Gold"" in New Brunswick. - A fact! We shall proveit. A specimen of sharpening stones, was forwarded to us a few days since, from the Miramichi, with a request that we would obtain a practical opinion as to its qualities. This stone abounds in immense quantities on the Tomoganops, a branch of the Northwest, so called, and is pronounced to be equal in every respect to the Turkey stone, for which our carpenters pay one dollar per pound. This stone possesses rather an advantage over the Turkey stone, as it can be used with water as well as oil. Persons are already actively engaged in Miramichi in cutting and dressing this stone. - The value of the export of sharpening stones from Turkey (said to be the best in the world) amounts to millions of dollars. Now only think of it. We have an inexhaustible quarry of stone, as good, in this Province, every pound of which will be worth a dollar, which is equal to gathering gold dust on the Sacramento. There is no ""hearsay"", or ""we understand"", about this. It is positive. The stone was sent to our office, and we immediately put it into the hands of several carpenters of experience and respectability, with a request that they would pronounce an impartial opinion; and they all agree that the stone is of the most superior description, equal to the article they pay a dollar a pound for. Here then is a mine of wealth itself. The riches of this province we believe to be equal to those of the most favored land on the face of the globe - not excepting California; but enterprise and capital are required to turn them to account. We further learn from Miramichi, by private letter, that there is asuperior description of clay in that section, fit for manufacturing delf, earthenware, and all articles of crockeryware; and if the Americans had such clay as this in their own country, they would manufacture crockeryware themselves, instead of importing it from England, for want of the raw material. This province also abounds extensively in the article of black lead, iron, lead, copper, coal, &c., &c. But, it is all useless to us. Now suppose this province were a state of the Union, and enterprise and capital could be infused among us, who can doubt but that this would be the very richest state on all the continent? But, our wealth is destined to remain in the bowels of the earth, until some great political convulsion overturns the present order of things - and when the landmark of prejudice, and of geographical nicety, shall disappear between the two people, we may expect to go on our way rejoicing, and reaping the rewards of plodding toil. We starve in the midst of plenty. We float upon a wreck, perishing of thirst - the ocean rolls around, but its waters cannot be converted into refreshing draughts, from want of the necessary apparatus to destroy its saline particles. How long must we continue so? - Heaven be merciful to a people whose land has been blessed with bounties in such rich abundance! Are we to toil on from day to day - men of intelligence - without making an effort to bring our country before the eye of the world? Thousands, nay millions of capital, are out at ragged interest in England and the United States, unrecuperative, unproductive; yet because our country is not known, scarcely beyond its own limits, the people are doomed to trudge along over mines of wealth, with poverty staring them in the teeth - bread scarcely to be had. We hope that some of our American contemporaries will take notice of the prominent points of the above article, that their readers may see what sort of a place ""down East"" is? Since writing the above, we are informed that a gentleman has arrived here from Miramichi, on his way to the United States, with a box of the stones before mentioned, to see what our neighbors think of them.

N.B. Courier - Sep. 27, 1851 We have been favored by the Directors of the Mechanics' Institute with the following Report, which we have much pleasure in publishing: Report on the Industrial Exhibition, Held at Saint John, On September

9th, (and following days,) 1851. To the New Brunswick Society for the Encouragement od Agriculture, Home Manufactures and Commerce throughout the Province. On the 11th of June last, W.J. Ritchie, M.P.P., the President of the St. John Mechanics Institute made application to the New Brunswick ... Class 1. Raw Materials: Sec. A. Minerals. The Exhibition was by no means complete in this department, although the Museum of the Institute, which was thrown open to the public, contains a great variety of the useful Minerals of the Province. We could wish to have seen at a glance, a series of the Provincial Rocks and Minerals of economic importance, and shall expect it at some future Exhibition. The Minerals exhibited on the present occasion were, many of them, of considerable interest. We may mention - A mass of native Black Lead, of which a large and valuable vein exists near Indian Town, and is now profitably mined by a Joint Stock Company. Samples of prepared Black Lead, exhibited by the St. John Black Lead Mining Company: this article seems well adapted to supply all the wants of our Provincial housekeepers. Asphatum or Asphaltic Coal, (for there is adoubt as to its true nature,) is a valuable Mineral, mined by a private Company in the Parish of Hillsborough, Albert County, and is already largely in demand for the manufacture of Gas. Soft bitumen, or Naptha, from the Petitcodiac, where it issues from the earth in a liquid form, and afterwards hardens by exposure to air. Asphaltic Shale, from Albert and Westmorland Counties; this is an article, the use of which in making gas, waterproof cements, pavements, &c., is increasing every day. Mineral Paint (an earthy oxide of iron, orferruginous earth,) from Shediac; this substance occurs in various parts of the Province, and is yet destined to replace all the forms of ordinary paint as a covering for wood work, &c. exposed to risks by fire. This present sample was exhibited by the Messrs. Gilbert. Mineral Paint, (an earthy oxide of Manganese,) from Albert County; an article which may yet be brought into use. Black lead, we may observe, is considered to be a good kind of mineral, or fire-proof paint; and we would suggest to the St. John Black Lead Company, that they should make some experiments upon the subject. Alabaster, or White translucent Gypsum; this is another of the varied Mineral products of Albert County; we observe specimens of it now for the first time on public exhibition, with great satisfaction; there is a square block of it, a vase turned from it, by Mr. McCoach, and a head carved in alto-relievo, on the same material, by Mr. Foulis. Its admirable purity and general qualities are well seen in these specimens, but none of them exhibit the beautiful polish of which it is susceptible. There is also a magnificent group of Chrystals of Gypsum, from Kings County, but their economic value is small as compared with the massive form from Hillsborough. Lime. - There is a cask of beautiful white Limeexhibited. This is one of our staple productions, and the St. John Lime is unsurpassed for its purity and general fitness for the purposes of the builder. The Limestone contains less than two per cent. Of impurities.Salt, by Joe Brand, of Sussex Vale; this salt is of first rate quality for farmers' purposes, and we are much pleased to learn that its manufacture has been resumed at the springs, and that Mr. Brand is enabled to sell it as low as the imported salt.Honestones, from the Kennebeckasis; these seem to be of good quality, and work either with water or oil. They bite well, and will compete with the Honestones of Woodstock or Miramichi, which are now coming into repute. Lead Ore. - Of this there are samples from King'sand Charlotte Counties, and Iron Ore from one or two places; but no information is given as to the probable supply from the various localities. The samples of Iron and Steel, from Woodstock,seem to be of the very first quality; the Iron has been bent and twisted, when cold, in every direction, but without showing the least injury to the fibre. It would be hard to devise a more complete proof of the quality of the article. We understand that the manufacture of Woodstock Iron will now be carried on vigorously by a Sheffield firm, who have become aware of its admirable qualities and adaptation for the making of Steel. Pipe Clay. - This article is from Albert County, and is exhibited by Mr. Foulis. It has a very good color, and seems to be well adapted for the manufacture of

Codes: I6 / IDX_Names: Silica, Tripoli, Diatomite, Infusorial Earth;

Headquarters - Oct. 30, 1850 and Miramichi Gleaner - Nov. 4, 1850 Tripoli. - We have been presented with a sample of this highly esteemed substance, which was found in the upper district of this County by Henry Jones, Esq. The New Brunswick Tripoli has been pronounced by those qualified to judge such matters, equal to the Mount Eagle, or any other yet discovered. The deposit is said to be inexhaustible."

St. Andrews Standard - Jun. 1, 1853 Woodstock. - We promised in our last to give a short notice of the improvements going on in this place... Across the bridge we see an extensive brick yard just put into operation by Mr. Elisha Baker. - The Messrs. Davis are nearly ready to start a new Iron Foundry; the machinery is all up and everything on the ground to commence operations. There is also a good prospect of another company being got up to smelt iron ore; if started, this, in addition to the old company, will make quite stirring times here. - [Carleton Sentenil"

Codes: 0275 / G6 / LIME / R7 / X2 / IDX_Names: Woodstock Fe; Bricks - General; Lime - General; Woodstock Silver; Carleton County Coal;

Carleton Sentinel Dec. 3, 1853 As we promised last week, and for the information of those of our readers who have not seen them we now proceed to give a short sketch of the Iron Works, &c., at the Upper Town and the operations there carried on. TheIron Ore is brought a distance of three miles from theirinexhaustible mines in Jacksontown, and laid on a layer of wood placed on skids to admit air underneath and piled alternately with layers of wood and charcoal to a height of 6 or 7 feet in long piles, about 20 feet wide, here it is roasted or calcined until it becomes easily broken into suitable sizes for the Blast Furnace. Charcoal is made in 6 large kilns, holding from 40 to 50 cords each, 3 taking about 8 to 10 days from the time of packing in the wood, to taking out the charcoal, which, when made, is taken to large Storehouses for use. On the yard we also saw some of the new Iron Ore, lately discovered in immense quantity about 300 yards from the

Furnace - this ore a Clay Iron Stone, we were informed, when mixed in certain proportions with the other, produced an Iron superior to any ever manufactured here. There were piles of a new limestone from the Sheriff's Hill, only about 600 yards from the Furnace, lately found - the nearness of this last effecting a great saving of transport, the Company having formerly to go 10 miles for Limestone. We next visited the Tunnel-head, where the furnace is filled or charged with the Charcoal, Ores, and Limestone, the Furnace is 35 feet high and 10 feet wide at its greatest width. The Engine house contains 3 Steam Engines for the Blast Furnace, of which only one was working, being sufficient to drive two large Iron Blowing Cylinders, which acting like immense Bellows were continually forcing air into a large Receiver, from whence it is conducted through pipes to the bottom of the Furnace, and there blown in through 3 Tuyeres, set close to the fusing mass of materials and having water continually passing through them to prevent their melting. Steam is raised in the Engine-house by the Gas or waste heat from the Furnace, being conducted under and returned through the Boilers - the same heat taken from the Furnace in another direction, when requisite, heats the air passing through the heating ovens, thus giving Steam and Hot-blast without any extra expense; and effecting a very great saving of fuel. - There was a third Engine supplied with steam, from the same Boilers, and used to set in motion a Circular Saw, and a large hammer for Blooms from a Puddling Furnace adjoining. On our way to the Casting-house, we were shown a Lime-kiln, Mortar-mill, Blacksmith's shop and Brick-yard, all very convenient for the Company's operations, and on their own premises. In the Casting-house we observed a man moulding Pig patterns to run the liquid Iron into - another was wheeling out the Cinders as they cooled. Being near Casting time we walked about, saw large heaps of the Cinders or Slag extending in the River, on the bank of which, the Pig Iron is piled in 3 ton heaps ready for shipping - the landing is one of the best on the river and accessible at all times during the navigation season. Close by the Casting-house is the line laid down in the preliminary survey of the St. Andrews and Quebec Railway, which, when completed will put these works in communication with the seaboard during the shutting up of the river navigation. It is now time to cast, or draw off the Iron melted during the previous 12 hours, and on returning we found men busily engaged tapping the Furnace, below where the melting Cinder was lava-like flowing over. The liquid Iron flowed along a Gutter in the sand, and soon filled one of the Beds of moulds or Pigs we saw making, it was then directed into another, and continued running until a third was filled, being, as we were informed, over three tons - this is done twice in 24 hours. As the Iron was near done running a large flow of Cinder came rushing out and was led over one side of the Gutter where it soon formed a small pool of liquid fire. We now wended our way homeward and in passing, must not omit mentioning the Company's Store and Boarding house, between which the road already partly graded runs to the mines at Jacksontown, - here the Railway is to be placed for the transport of the Ores and Limestone which lie in one continuous route. As we stated in our last the result of the present experiments has proved highly satisfactory, Iron can be produced of excellent quality and abundant quantity, and the Company are so far encouraged as to meditate an enlargement of their Capital Stock which the Act of Incorporation empowers, with a view to operations on an extended scale and the manufacture of the Iron into Bars. We wish them that success which their enterprise well deserves, and with which we think the destinies of this flourishing County particularly interwoven. No need of going to California or Australia if the mineral wealth of our County be only properly developed. Carleton possesses a Steel-making Iron Ore in quantity sufficient to render Great Britain independent of Sweden or Russia for generations, and which only requires an outlay of some of the superabundant capital of Britain to make it as well known in London and Sheffield as the best works of those Countries. We repeat, our County is rich in Mineral wealth.We have seen a very rich specimen of lignite, the outcropping of Coal found not over 3 miles from where we write, which, ignited well and burnt away leaving but very little residue. We have also been shown Silver-leadfluxed and melted from Ore found in this our County. These sources of Mineral wealth and our high Agricultural Capabilities warrant the inference that Carleton is soon to be destined to take rank as one of the richest Counties in the Province of New Brunswick."

Codes: 0275 / G6 / LIME / R7 / X2 / IDX_Names: Woodstock Fe; Bricks - General; Lime - General; Woodstock Silver; Carleton County Coal;

St. Andrews Standard - Dec. 14, 1853 Woodstock Iron Works. - The following interesting sketch of the Iron Works of Woodstock, is given by the Editor of the Sentinel, from whose paper we copy it:- ""The Iron Ore is brought a distance of three 12 miles from the inexhaustible mines of Jacksontown and laid on layer of wood, placed on skids to allow air underneath and piled alternately with layers of wood and charcoal, brought to a height of 6 or 7 feet in long piles, about twenty feet wide, here it is roasted or calcined until it becomes easily broken into suitablesizes for the Blast Furnace. - Charcoal is made in 6large kilns holding from 40 to 60 cords each, taking about 8 to 10 days from the time of packing in the wood, to taking put the charcoal, which when made, is taken to large storehouses for use. On the yard we also saw some of the new Iron Ore lately discovered in immense quantity about 300 yards from the furnace - this ore is Clay Ironstone, we were informed when mixed in certain proportions with the other, produced an iron superior to any ever manufactured here. There were piles of a new limestone from the Sheriff's Hill, only about 600 yards from the Furnace, lately found, the nearness of this last effecting a great saving or transport, the Company having formerly to go ten miles for Limestone. We next visited the Tunnel head, where the furnace is filled or charged with the Charcoal, Ore and Limestone, the Furnace is 35 feet high and 10 feet wide at its greatest width. The Engine House contains two Steam Engines for the Blast Furnace of which only one as working, being sufficient to drive two large Iron Blowing Cylinders, which acting like immense Bellows were continually forcing air into a large Receiver, from whence it is conducted through pipes to the bottom of the furnace, and there blown in through 3 cuyeres, set close to the fusing mass of materials and having water continually passing through them to prevent their melting. Steam is raised in the Engine house by the Gas or waste heat from the furnace, being conducted under and returned through the Boilers, the same heat taken from the

Furnace in another direction, when requisite heats the air passing through the heating ovens, thus giving Steam and Hotblast without any extra expense, and effecting a very great saving of fuel. There was a third engine supplied with steam from the same Boilers, and used to set in motion a Circular saw, and a large hammer for Blooms from a puddling furnace adjoining. On our way to the Casting house, we were shown a Lime kiln, Mortar mill, Blacksmith's shop and Brick yard, all very convenient for the Company's operations, and on their own premises. In the Casting House we observed a man moulding Pig patterns to run the liquid Iron into - another was wheeling out the cinders as they cooled. Being near Casting time we walked about, saw large heaps f the cinders of Slag extending to the River, on the Bank of which, the Pig Iron is piled in 3 ton heaps ready for shipping - the landing is one of the best on the river, and accessible at all times during the navigation season. Close by the Casting House is the line 13 laid down in the preliminary survey of the Saint Andrews and Quebec Railway, which, when completed, will put these works in communication with the seaboard, during the shutting up of the river navigation. It was now time to cast or draw off the Iron melted during the previous 12 hours, and on returning we found men busily engaged in tapping the furnace, below where the melting cinder was lava-like flowing over. - the liquid Iron flowed along a gutter in the sand, and soon filled one of the beds of moulds or Pigs we saw making, it was then directed into another, and continued running until a third was filled, being, as we're informed, over three tons - this is done twice in 24 hours. As the Iron was near done running, a large flow of cinder came rushing out and was led over one side of the gutter where it soon formed a small pool of liquid fire. We now wended our way homeward and in passing must not omit mentioning the Company's Store and Boarding House, between which the road already partly graded runs to the mines at Jacksontown, here the Railway is to be placed for the transport of the Ore amd Limestone which lies in one continuous route. We repeat, our County is rich in Mineral wealth.We have seen a very rich specimen of Lignite, the outcropping of Coal, found not over 3 miles from where we write, which ignited well and burnt away leaving but very little residue. We have also been shown a Silver leadfluxed and melted from from Ore found within our County These sources of Mineral wealth and our high Agricultural capabilities, warrant the inference, that Carleton is soon destined to take rank as

Morning News - May 8, 1854 ADVERTISEMENT: Brick Yard to Lease. - The subscriber will Lease for 1 or a term of years, a first rate site for a Brick Yard - water carriage - abundance of cheap fuel, with tillage and pasture land, also, if required. For full particulars enquire of april 7 D.H. Anderson."

Codes: G6 / W4 / IDX_Names: Bricks - General; Chamcook Brick;

St. Andrews Standard - May 17, 1854 Brickyard.- We understand that a brick Yard has been opened at Chamcook, for the manufacture of this indispensable building material. Already several men are engaged on the work, and there cannot be a doubt, but that the undertaking will prove remunerative to its enterprising proprietor. The want of an establishment of this description, near the Town, has been much felt; even during the last year parties were obliged to send to Belfast, Maine; and one person not obtain a sufficient quantity before winter set in, to build a house. This desideratum will now be supplied, and we trust the proprietor will be encouraged."

Morning News - Jul. 10, 1854 ADVERTISEMENT: Clayton's Patent Brick Making Machine. The subscribers having been appointed Agents for Henry Clayton, Esq., Inventor and Patentee of ""Clayton's Brick Making Machine,"" which has taken the principal prizes at the Great Exposition of Industry at London, Amsterdam, and elswhere, and having taken out and secured the Patents for this Province and prepared to dispose of the same or the Patent right for New Brunswick, or the right to make machines in the Province. Specifications and Plans, as also Testimonials from the first class Brick Yards in Great Britain, and all other information may be had on application to Kinnear & Howard, Agents for ""Clayton's Brick

Morning News - Jul. 10, 1854 Patent Brick Machine. - We beg to direct the attention of our readers to the advertisement of Messrs. Kinnear & Howard, respecting the manufacture of bricks. We think there is a capital opening in St. John for the introduction of such a machine. We copy the following, from a great number of articles in praise of the invention. Clayton's Patent Brick Machine. - The capabilities of this machine for all ordinary clays, and to the using of such clay so much stiffer than ordinary, have been fully established, and in consequence it has been much admired by all who either have witnessed its operations, or taken an interest in such matters. We understand the Messrs. Waring (Brothers), Railway Contractors, expressed a wish lately to ascertain by occular demonstration themselves, what result could be effected by the machine with the softest clay. The ingenious patentee, feeling confident of the high qualifications possessed by this most important part and useful invention, readily acceded to such a request. The machine was set to work in the presence, and under the entire direction, of the above-named gentleman, with one horse, an unskilled laborer, and two boys. - The clay, a very rough kind, being made to the softest consistency possible, the horse was started, and permitted to travel at its own speed continuously for 5 minutes, when Messrs. W. stopped him, and after examining the bricks, (of which 101 were made, being at the rate of 12,000 per day of ten hours), pronounced them to be good and clean. These gentlemen then expressed to Mr. Clayton their entire approval of the machine, and stated their object was to be fully convinced of its general utility and capability to work clays of any stiffness and quality, previously to ordering several of them for use on certain foreign contracts. - Agricultural Magazine, February, 1854."

Weekly Record - Fri., Feb. 3, 1903 A Queens County Industry. - An Ottawa despatch tothe St. John Telegraph says: 'Your correspondent learned today of an enterprise in New Brunswick likely to assume dimensions of grand proportions. Representatives of American and Canadian capitalists forming the works which owns the patent right for the Macadamite metal were in Ottawa today on business in connection with the new metal. It is intended to at once enlarge the works which have been established at St. John, but those interested have a larger plan in view. It is nothing less than the establishment in the vicinity of the coal fields in Newcastle, Queens County (N.B.), of works for the manufacture of aluminum, which is one of the elements of the macadamite metal, and for which there is an enormous and rapidly increasing demand. Two essentials are necessary for its successful manufacture, cheap clay of the proper percentage of oxide of silica, and cheap power. It appears that underlying the coal deposits ofQueens County (N.B.), is an abundance of fire clay which has been carefully tested and found suitable for the manufacture of aluminum. The abundant supply of coal ensures the other requisite of cheap power. Arrangements have been made with the New Brunswick Coal & Railway Co. for subletting a portion of its areas and a company to be called the Aluminum Production Company of New Brunswick is now in process of organization. The company will use a large quantity of coal in its factories and employ several hundred hands. Large contracts have been entered into for the supply of the metal to railway companies, and others, and those interested are confident of success."

Kings County Record - May 24, 1912 Jordan Mountain Polish Mine. - A Natural Polish has been Discovered There. - An Unlimited Supply. - Newton Manning, of Newtown, is the discoverer of a polish mine at Jordan Mountain, which will be worked at once and the product put on the market. Mr. Manning made the discovery a long time ago and tried to get ..?... on the deposits but found that this was impossible and that the rights were carried with the land. Accordingly he and the owner, Mr. Hall, formed a partnership and will work the property, commencing operations. The deposit is ten feet wide and runs for a mile, having been traced for that distance. It has been thoroughly tested for many purposes and has given the greatest satisfaction to all who have used it. It will clean anything about a house and is invaluable in the kitchen. On the other hand it will not damage the finest silver and will make brass shine in a way that will warm the heart of any housewife. Mr. Manning made his discovery in a somewhat novel way. He picked up a rock and noticing that it was soft started to chip it off. The blade of the knife immediately showed evidence of improvement in the way of cleanliness and the finder had his curiosity aroused. He secured samples and made a test of the powder, later sending other samples away. The reports received were most encouraging and he got busy on the location. The powder was tested by a representative of the Record and it will certainly do all that the owners claim for it. No treatment is necessary, except to grind the rock to a fine powder, before placing it it in packages and putting it on sale. A large quantity was ground this week at William Holman's mill and it is probable that more improved machinery will be installed, so as to get a finer reduction. The firm has placed its order for tins and will shortly offer the product to the public. So far as the supply of the powder is concerned, it is practically inexhaustible."

Moncton Daily Times - Jun. 9, 1924 Early History of Albert County. - ... About 1800 commerce had so far opened up with other parts that the attention of the colonists was turned in the direction of shipbuilding. ... Among the first vessels built ... was ... the 'Brothers'. Thisvessel was employed chiefly in carrying plaster to Lubec,Maine, (the only seaport for this then) where it was sold and such commodities as the colonists needed brought back. She was retopped about thirty years after and employed in carrying plaster from the quarries on the south shore of Shepody Bay, now operated by the Albert Manufacturing Co., and known as Pink Rock. This vessel carried about 80 tons which was in those days considered a large cargo. ... Plaster was got out from the quarries nearer the river known as the 'Kings Quarries'. Two or three residents

clubbed together, spent the winter breaking out plaster, which was hauled on the snow by teams to the bank of the river and shipped to Lubec in the spring. This would provide for them their summer supplies. A brisk business was carried on about eighty or ninety years ago getting plaster from the King quarries, which was run out on a wooden rail track and cars with flanged iron wheels. About the same time a brick yard and tannery was established on a rising ground at the head of Edgett's Creek and nearly surrounded by marshes. ..."

Codes: G6 / IDX_Names: Bricks - General;
Telegraph Journal - Sep. 30, 1929 Fredericton Brick Plant Is Enjoying Busy Season. - Demand for Product of M. Ryan & Son, Ltd., Greatest in History. - Plant Busy. - Business is Trebled in Last Few Years; Bright Future in Store. - The firm of M. Ryan and Son, Ltd., Fredericton, brick manufacturers, founded in 1873 by the late Michael Ryan, and incorporated in 1919, is experiencing a very busy season. the directors, J.F. Ryan and F.S. Mundle, are experiencing a very busy year, as the demand for Ryan's cherry red - Ryan's corrugated and Ryan's stock brick has been the greatest in the history of the company. Ryan's bricks are well known throughout the Maritimes and the New England States and the popularity of them during the last few years has trebled the business. During the present season they have supplied the brick for the Lady Beaverbrook Memorial library in connection with the University of New Brunswick. This building is faced with Ryan's corrugated brick and backed up with their stock brick, taking about 600,000 and is generally conceded to be one of the finest examples of brickwork to be found, not only in Canada, but also in the United States. Other U.N.B. buildings now in course of construction are those for forestry and mineralogy, also the library, and are being constructed with Ryan's Cheery Red and Ryan's stock brick, taking in all about 1,500,000 bricks. Several other large buildings have been constructed during the last few months, among them being the Chestnut Canoe Company and the Eastern Bakery buildings. The former is built of Ryan's Cherry Red, and the latter with Ryan's corrugated brick. In Saint John the Nesbitt wing in connection with the hospital at East Saint John, and the New Albert School, the former is of Ryan's Cherry Red and the latter used Ryan's stock brick. One of the largest brick buildings now in course of construction in Moncton is the hospital extension, for which Ryan's Cherry Red bricks are being used, and this promises to be one of the finest pieces of brickwork in that city. It is a pleasure for anyone to pay a visit to the Ryan plant at Fredericton, as well as exceedingly interesting, educative and instructive to gain some knowledge of the industry. Here at this plant, situated on the Woodstock Road, everything that goes into the manufacture of Ryan's bricks is to be found on their own property, which occupies some 20 acres. The clay used in the process is said to have been the sediment left by the river which thousands of years ago coursed through this property. An inspection of the clay used evinces each year's sediment, and upon closer examination it is found that the clay - a dull slate or greenish color - is quite plastic and much like rubber in appearance. The clay is dug and conveyed by trolley into the plant, where it is crushed to eliminate any hard substance such as rock. The clay is so rich that shore sand - also to be found on the property of the company, but only a stone's throw away from the plant - has to be mixed with it. Another feature of the undertaking is that pure spring water, so necessary in the making of good brick, is to be had right on the company's premises where three splendid springs supply the water required. After the clay is crushed, it goes into the pugmill and then into the moulding machines, then onto pallets and is carried by carriers into the driers, where 10 miles of steam pipe is housed, and with a capacity of 20,000 bricks. There for nine hours these green brick are dried before going on into the kilns. There are three large kilns with a total of six ovens, having a capacity of 100,000 brick for each oven, where for seven days and seven nights the temperature is gradually brought up to 2000 degrees. At the sixth day the iron and other substances in the brick turn from grey to a rich cherry red color. The machinery used throughout at the plant is probably the best obtainable, and depicts a vastly different picture there today from the old methods, abolished about 25 years ago. The Ryan Company have in their employ a number of 'old-timers' that have been born and brought up in the business. Among them is Thomas Smith, who stands almost seven feet in height and is nearing the three score and ten mark. Mr. Smith is in charge of the mixing and tempering of the clay, is known as 'the mixer' and probably has the most responsible position in the plant, because if he should have just a bit too much water or too much sand in the clay he will have trouble with the moulding - the brick will be too muddy and will not take kindly to the moulds. More than 100,000,000 brick have passed through his hands. Next to Mr. Smith is the moulder, Harry Collett, who has a very important job. He is responsible for the moulding and shaping of the cherry red and the corrugated facing brick. Once the bricks take their shape and become dry, the shape is permanent until they are broken or destroyed by force. He also holds the honor of having handled upward of 100,000,000 bricks in his day. Another of the 'old timers' is the brick burner, Samuel Currie. He is responsible for the burning of these cherry red bricks and it is a pleasure to see him feed the fires, using about 3,500 cords of wood per year. He has a splendid record to his credit for perfect burning of brick and within the next few years he will have passed the 100,000,000 mark. The Ryan Brick plant is ideally situated for clay, sand, water and fuel with their seven car railway siding with the yard space sloping in such a way toward the siding that the brick travel on their own weight from the dryers to the cars, have conditions so favorable that they are able to compete with lumber, concrete and tile. Why gamble with inferior

material? why take a chance on sagging wall and cracked plaster when one knows the piece of mind that comes only from the knowledge that brick withstands all the elements, they ask. Howells Frechette, chief of the ceramics and toad materials division, Department of Mines, Ottawa, speaks in glowing terms of the Ryan plant, claiming it to be the neatest and best kept brick plant in America. Visitors are always welcomed at the plant. PHOTOS: Caption: F.S. Mundel, secretary and treasurer of M. Ryan & Son, Ltd., brick manufacturers, Fredericton. Caption: Harry Collett, brick moulder at the Ryan plant, Fredericton, through whose hands upward of 100,000,000 bricks have passed during his connection with the firm. Caption: J.F. Ryan, president of M. Ryan & Son, Ltd., brick manufacturers, Fredericton."

Evening Times-Globe - Apr. 18, 1961 L.E. Shaw Brick Company Marking 100 Years of Achievement. -Firm Operates Eight Plants in N.B. and N.S. - PHOTOS of A.C. Cole, vice president, R.H. Shaw, president and Lloyd R. Shaw, vice president. L.E. Shaw Limited is celebrating its 100th anniversary this month. Founded as a tiny plant a couple of miles outside Hantsport, N.S., in 1861, the firm has grown and expanded through the century to eight modern plants in Nova Scotia and New Brunswick centres. From the limited production of brick at Robert Shaw's small place in 1861, the output of bricks alone has grown to over 40,000,000 a year. In addition the company, keeping up with the changing demands, is now making concrete and thermocrete blocks, precast roof and floor slabs, concrete sewer pipes, speed tile, drain tile and flu lining. Founder of firm. - Robert Shaw, founder of the firm, was born in Falmouth, N.S., about 1840. At the age of 12 he went to sea, to help his struggling family. At 18 he retired from the sea, and took a contract to supply railway ties. And at about 21 he started his little brick plant. Through moves and changes and difficulties Robert Shaw progressed. His son, L.E. Shaw was born in 1878, grew up to know the business thoroughly, operated a plant under another owner, and in 1906 formed his own first company, Middleton Brick and Tile Co. Finally in 1924, L.E. Shaw Limited was incorporated. The depression years took their toll and closed two plants. But in 1936, L.E. Shaw tried a new venture, home construction, creating a use for his products. Constant Progress. - The Shaw plants keep up with the times. Year after year, new machinery appears. L.E. Shaw died in 1960. His two sons keep up the family tradition. R.H. Shaw as president and L.R. Shaw as vice president. The other vise president is A.C. Cole. With head office in Halifax, N.S., the company has plants at Chipman, Fredericton and Saint John in New Brunswick, and in Nova Scotia at Halifax, Dartmouth, Sydney, New Glasgow, and the biggest plant, at Lantz, near Elmsdale."

Codes: 0001 / 0721 / 0707 / 0030 / HILL / Z2 / P3 / J8 / IDX_Names: New Horton Copper; Shepody Mountain Manganese; Dawson Settlement; Teahan Mine; Grey Brook Gypsum; Sandstone, Building Stone, Monument Stone, etc.; Albert Lime, Phosphate and Brick Company; Albert Mines;

S.J. Daily Sun - Apr. 11, 1881 The Mineral Wealth of Albert. - Hillsboro, April 4th, 1881. Mr. Editor:- I have noticed from time to time that reference has been made to the mines and minerals of Albert County. So the Frenchman said of London, it is a province covered and filled with mines and minerals; and - much has been said and written, perhaps the half hasnot yet been told. Beginning at the boundary line between Albert and St. John Counties, we find copper all along the bay shore as far east as Salmon River, where a company is about being formed by Messrs. Cleveland and Steadman, with a capital of $100,000. We wish the enterprise every success. Coming up to Harvey we find a valuable depositof the same mineral at New Horton. At Harvey Point wefind the famous freestone quarries of Messrs. Roberts & Stevens. From these quarries a large number of the stone buildings of Boston and New York have been built. Coming up to Hopewell are the famous stone quarries of Messrs. Hayden, employing a number of men. At or near the Hill Corner has been discovered of late, manganese said to beworth $130 per ton. The company is about commencing operations on a large scale. In Salem manganese has beendiscovered on the farm of Jeremiah Steeves, only awaiting further developments. The lime stone worked by Messrs. McHenry, as well as the plaster quarries of J.T.Tompkins, are considered inexhaustible. That yellow metalso much coveted called gold has been discovered at New Ireland. We learn that searching and exploring willcommence immediately. We are indeed sorry to say that thefamous Albert coal mine is about to close, the deposit of Albertite, worth $25 per ton, having about run out. During the twenty-two years it has been worked, about $4,000,000 worth of that wonderful coal has been raised. Yet it is the opinion of experienced miners that the Albert mine is only a branch of the grand trunk and that the grand trunk is in Baltimore, about four miles west of the Albert mine. Miners tell us that the course of the coal in the Albert Mines is east and west, and as the mountains of shale in Baltimore more correspond exactly with the shale at the Albert mines, and the course is directly west, it looks both reasonable and probable that the Albert coal, so called, exists in mammoth deposits in Baltimore; and, as further proof of coal in that place, small pieces of coal precisely like the Albertite coal can be picked up at any time in the small brooks and rivulets running through those shale regions, which, of course, have been washed out in times of heavy rains. And as those undeveloped coal fields, as we believe them to be, are only four miles from the Albert Railway, and a level grade to and from, the means of transportation would be both cheap and easy; and we believe that if a little capital now lying idle in England and other countries was expended in Baltimore, the remuneration might be counted by millions. Yours,

Daily Telegraph - Jun. 15, 1881 Economic Minerals of New Brunswick. - Although New Brunswick is inferior to Nova Scotia in minerals, it still is entitled to consideration in that respect, and it is not improbable that at some not distant day we shall see some new developments in connection with the mineral wealth of this Province. A few words now, (in answer to several correspondents) in regard to the useful minerals of New Brunswick which have been so far discovered. The coal areas of the Province are very extensive, and although the seams are thin, not more than 22 inches, and only worked at Grand Lake and one or twoother places, it is quite possible that they may have eventually be worked much more extensively. It is estimated the Newcastle coal basin alone contains upwards of 100,000,000 of tons, most of which could probably beobtained. When St. John becomes a great manufacturing city this coal will no doubt form an important factor in its prosperity. The Albertite has had a great history, but present appearances are unfavorable to that mining interest. There are several seams of anthracite in theDevonian strata at Point Lepreaux and also at Musquash. It has, however, not yet been determined whether these seams can be worked with profit, owing to the large amount of ash left after combustion. Copper ores have been found in many places inCharlotte, in Albert and elsewhere, but, so far, have not been worked with profit. Baryta, used for making, or rather for adulterating white lead, has been found at Frye's Island, Charlotte Co., where also galena and silver have been found. Minute quantities of gold have been found from time to time in several localities, but nothing has beendone in the way of mining. Argentiferous galena has been found in several localities. At Wannemake's, on Hammond River, the galena has been found to yield a fair proportion of silver. In 1878, on the west side ofMusquash harbor, yellow sulphuret of copper and galena were found in veins of white quartz, to the amount of $14 per ton, as was shown by actual assay. The hardness of the rock and the smallness of the vein are, however, against its profitable working. Considerable quantities of silver have been found in the same locality. Bituminous shales are found extensively inAlbert, Kings and Westmorland, capable of yielding from 65 to 90 gallons of crude oil to the ton, but they are of little value so long as petroleum is so abundant. Bog iron ores, believed to be of commercial value, have been found at Burton, in Sunbury, and also at Maryland in York. Large deposits of iron ore of very superiorquality are found at Jacksontown and other parts of Carleton County. Some of these samples have yielded as much as 48 per cent of iron. There seems to be no doubt that these mines will eventually be worked with profit. Black sand containing magnetic iron ore has been found at St. Martins, in the vicinity of St. John, and elsewhere. Antimony is found in great quantities in PrinceWilliam, York. These mines are worked with profit and the quality of antimony is excellent. It is largely used in making Babbit metal. Manganese is another profitable New Brunswick mineral. It is found at Markhamville, Kings County; in the County of St. John, on the South West Miramichi, and elsewhere. In addition to these minerals, there are manyothers more or less widely distributed. Clay fit for bricks and pottery is abundant. Granite in various colours is widely distributed in Charlotte and Queens, and red granite is largely exported to the United States and Upper Provinces. Graphite, or black lead, is foundnear St. John, and also in Queens county. Grindstones and freestones of the best quality abound, especially about the head of the Bay of Fundy. Gypsum is also abundant inAlbert and Westmorland. It also occurs in Kings and St. John Counties and on the Tobique. Kaolin fit for the manufacture of pottery is found in the granite districts of Charlotte. Limestone is abundant and is found of the best quality about St. John.Iron pyrites is found on the St. John and Miramichi. Saltsprings exist at Sussex and in the parish of Upham. There are other minerals of less value which might be named,but these we have mentioned are sufficient to show that the mineral wealth of the Province is by no means inconsiderable. A survey made with a view to practical economic results, rather than a

Daily Telegraph - Jun. 15, 1881 Economic Minerals of New Brunswick. - Although New Brunswick is inferior to Nova Scotia in minerals, it still is entitled to consideration in that respect, and it is not improbable that at some not distant day we shall see some new developments in connection with the mineral wealth of this Province. A few words now, (in answer to several correspondents) in regard to the useful minerals of New Brunswick which have been so far discovered. The coal areas of the Province are very extensive, and although the seams are thin, not more than 22 inches, and only worked at Grand Lake and one or twoother places, it is quite possible that they may have eventually be worked much more extensively. It is estimated the Newcastle coal basin alone contains upwards of 100,000,000 of tons, most of which could probably beobtained. When St. John becomes a great manufacturing city this coal will no doubt form an important factor in its prosperity. The Albertite has had a great history, but present appearances are unfavorable to that mining interest. There are several seams of anthracite in theDevonian strata at Point Lepreaux and also at Musquash. It has, however, not yet been determined whether these seams can be worked with profit, owing to the large amount of ash left after combustion. Copper ores have been found in many places inCharlotte, in Albert and elsewhere, but, so far, have not been worked with profit. Baryta, used for making, or rather for adulterating white lead, has been found at Frye's Island, Charlotte Co., where also galena and silver have been found. Minute quantities of gold have been found from time to time in several localities, but nothing has beendone in the way of mining. Argentiferous galena has been found in several localities. At Wannemake's, on Hammond River, the galena has been found to yield a fair proportion of silver. In 1878, on the west side ofMusquash harbor, yellow sulphuret of copper and galena were found in veins of white quartz, to the amount of $14 per ton, as was shown by actual assay. The hardness of the rock and the smallness of the vein are, however, against its profitable working. Considerable quantities of silver have been found in the same locality. Bituminous shales are found extensively inAlbert, Kings and Westmorland, capable of yielding from 65 to 90 gallons of crude oil to the ton, but they are of little value so long as petroleum is so abundant. Bog iron ores, believed to be of commercial value, have been found at Burton, in Sunbury, and also at Maryland in York. Large deposits of iron ore of very superiorquality are found at Jacksontown and other parts of Carleton County. Some of these samples have yielded as much as 48 per cent of iron. There seems to be no doubt that these mines will eventually be worked with profit. Black sand containing magnetic iron ore has been found at St. Martins, in the vicinity of St. John, and elsewhere. Antimony is found in great quantities in PrinceWilliam, York. These mines are worked with profit and the quality of antimony is excellent. It is largely used in making Babbit metal. Manganese is another profitable New Brunswick mineral. It is found at Markhamville, Kings County; in the County of St. John, on the South West Miramichi, and elsewhere. S.J. Daily Sun - Jan. 19, 1888 New Brunswick as a Mining Country. - New Brunswick has never much parade of its mineral wealth, but notwithstanding, the province derives substantial advantage from these possessions. The economic minerals now mined or quarried in the province include coal, gypsum, granite, manganese, lime, grindstones and building stone, antimony, besides some less important substances. None of these minerals is yet worked to any extent compared with the possibilities. The province has no department of mines and no official with authority to collect returns as they have in Nova Scotia. The nearest approach to official statistics are to be found in a report for the year 1886, prepared by Eugene Coste, the mining engineer of the Canadian geological survey. This valuable work is published by Dawson Bros., by authority of parliament. Mr. Coste has been at pains to collect returns from all provinces of their mineral produce and export. The author is not able to tell us much about the coal product of this province owing to the desultory character of mining in New Brunswick. We, or course, know that a considerable quantity is mined at Grand Lake for local consumption in the river districts, and that this coal is used on the New Brunswick railway. It is also sold at St. John. Grand Lake district will next year be put in communication by rail with the outside world, and in a short time will be connected with Montreal, and the coal consuming regions of the west. Then we shall know whether New Brunswick coal fields are rich as has been supposed. The province once exported $100,000 worth of albertite in a year. The census of 1881 credits the Grand Lake district with producing 6,221 tons. We imported in 1886 from Nova Scotia 197,028 tons which at the value given to other Nova Scotia exports would be worth at the place of shipment $375,600. We also imported from other countries 34,845 tons of anthracite, valued at $111,260, and 8,992 tons of bituminous, at a cost of $17,535. It will be seen that New Brunswick has a fine home market. The antimony produced in Canada, comes mostlyfrom Nova Scotia. In 1886, the export of this province was 20 tons valued at $800. It was produced at Lake George, York County. The Rawdon mine in Hants county, Nova Scotia, turned out over $30,000 worth. Of graphite Canada exported $3,586 worth in 1886, all from New Brunswick. The quantity of gypsum produced in Canada has not been ascertained. The exports of crude plaster are givenas 442,833 tons for the Dominion, and 23,498 for this province. The value of the New Brunswick product, nearly all of which goes from Albert county, is $10,559. The quarries on the Tobique river have great possibilities, but are not yet strong competitors with those of Albert county. The total product of the manganese mines in Canada in 1886 is said to have been 4,789 tons, worth$11,499. Of this New Brunswick furnished 4,545 tons, valued at $22,054. The customs statement of export gives a larger value, the foregoing being the estimated worth at the mine. The geological survey people claim to have pretty full returns of granite production in Canada. This gives the total quantity in the rough at 6,062 tons, worth $63,309. New Brunswick is credited with 2,552 tons, valued at $34,509. It is perhaps not very easy to fix the value of the rough stone, but the value of the red granite, as turned out of the polishing works, was in 1886, four times the amount given. Mr. Coste admits his returns of other building stones to be incomplete. He has heard from producers of $??? Of value and it appears that this represents from three to four fifths of total output. Three returns from New Brunswick give 2,728 tons, worth $24,970. His return of the produce of lime quarries as also admittedly incomplete. The total amount heard fromat the statistical office was valued at $283,756. New Brunswick's share being $58,120. New Brunswick is the only province which produces lime for export. Mr. Coste returns includes brick, concerning which he has fourteen reports from New Brunswick disclosing a product worth $30,908. Four quarries in Gloucester County report an output of grindstones to the value of $22, 495. From above returns it would appear that New Brunswick stands well, both in respect to variety and quality of mineral resources. Our coal supply is only beginning to be available. The red granite industry hasbeen doubling its product every three or four years. Lime quarries have been for the past four years doubling their operations every year. The plaster export of 1886 was 50 per cent larger than in the preceding year, and fifteen per cent in excess of any previous year. The construction of the Tobique railway to Plaster Rock will bring a new field into operation. New investments were made last year in manganese properties, and it is probable that the work now in operation will be extended The exports in 1886 were only exceeded in value by that of 1885 and that of 1880, while that year's sales were probably in excess of any previous year. The total value of mineral export from New Brunswick to foreign countries in 1886 calendar year is given by the customs returns at $101,349. The actual amount of sales outside

Codes: 0019 / 0603 / 0311 / LIME / IDX_Names: Wheal Louisiana Copper; Frye Island; Letete Mine; Lime - General;

N.B. Courier - Jul. 31, 1863 and St. Andrews Standard - Aug. 5, 1863 Mining in Charlotte County. - On Thursday last, the scattered farmers, fishermen and miners of that bleakand barren promontory known as Letete, were startled with an unexpected influx of visitors. The object of their search was the copper mine worked by Mr. Key, and a party of miners for Messrs. Johnston & Co. of England - They also visited the copper mine of Mr. Woodward, which lies adjacent to it, and close by the seashore. It has been worked for over a year, and a shaft sunk to a depth of over 100 feet. Several favorable looking specimens of copper ore have encouraged the proprietors to proceed in the outlay of a very considerable sum of money, which, it is to be hoped, may one day be repaid with interest. Several copper lodes, permeating quartz and slaty-like veins, have been discovered near this shaft, and it is intended to ""drift"" into them from the point reached, in the hope that something handsome may soon ""turn up"". The operation of sinking is carried on by blasting through the ledge, and in the present case the miners do not require to come to the surface during the moment of explosion, but can turn aside into the ""drift"" or lateral excavations. The light of a candle is used, and foul air is not felt or complained of, but the smoke occasioned by the blasting is a serious annoyance. At a short distance, on a rocky and barren eminence, is the other copper mine. Several copper lodes, of considerable length and breadth, converge near the spot where the shaft has been sunk to a depth of over 50 feet. The mining engineer is Mr. Key, a quiet Cornish man, thoroughly acquainted with mining operations. Near the shaft is a substantial workshop. This shaft is more easily descended than Mr. Woodward's - Here we saw several rich specimens of copper ore, and found on the part of Mr. Key a confident expectation of more and better. The whole province will watch the result of these mining operations with interest. It will be well for other districts to await the test now being applied 5 at such expense. - Should the operations succeed, the bleak rocks of Letete will be covered with an industrious population, who will trade with St. George and St. Andrews, and buy beef and mutton from the neighboring farmers. - Should they fail, experiments so costly will deter others from engaging in similar operations for a long time to come. A party of us also visited Frye's Island, close by, in which there is a belt of limestone, containing several veins of quartz, fluorspar, and to all appearances, both galena and barytes, two valuable ores of lead. The lodes run E.N.E., very much in the direction of the copper lodes. We have a hope that some day capital may be found to test the lodes which Mr Fry has, with much effort, sought out. - Col. Pres."

Chignecto Post - Apr. 14, 1881 Mining and quarrying will be prosecuted with increased vigor during the coming summer. Preparations are being made to work the rich vein of manganese discovered last summer at Hopewell Hill; operations ingold and silver mining will be commenced at New Ireland; and copper mining will be actively prosecuted at Alma.Coal mining will also receive some attention in the latter parish. The Albert Manufacturing Company, under the energetic management of Mr. J.T. Tompkins, will, of course, do its usual extensive work in the plasterbusiness, and Mr. McHenry's lime (which is an unusually good article) will probably find a more extensive market.In the freestone quarries, unusual activity prevails. The Bay of Fundy Company are giving employment to a large number of men and expect to do a good business. A short distance from them are the quarries of Messrs. Stevens, while not far from them are those on the lands of F.W. Watson, and for the working of which the International Company has just been organized by Boston capitalists. All these quarries will be busy hives this summer, and on Grindstone Island a large boarding house, for the

St. Croix Courier - Apr. 5, 1956 Buchanan in Legislature: - Reviews Mining, Forest Conditions in Province. - Fredericton. - Lands and Mines Minister Norman Buchanan of St. Stephen reviewed mining ..... making specific mention to Charlotte county ...... Interesting. - The minister said nickel in 'the St. Stephen area' and copper on the 'south coast' of the province were still of interest to mining companies. He did not elaborate. '... Speaking of mining, sir, it is like a story I read the other day of a pink and blue surprise party held in one of the homes and after the lady opened all the parcels she said: 'I will tell you of another surprise, I am not expecting.' That is the way it is in New Brunswick. Nobody was expecting any discoveries would be made here. I didn't mean to be rude, sir. 'We might wonder why these mineral finds were delayed. To put it simply, it was because of the terrific overburden, excepting the Brunswick property which will be mined in the open pit method. 'The great difficulty was that the old methods of prospecting wouldn't apply. Prior to the discoveries in New Brunswick, geophysics was somewhat like water witching. They have proved themselves, they have shown their worth and discovered for us that which is going to be something of great importance. 'In geophysics we simply mean the magnetometer and electromagnetometer air and ground surveys. A magnetometer is a survey which measures the variation in the earth's magnetic forces. By these variations and the measures of the variations, different forces indicate different types of minerals. The electromagnetometer measures the phase difference between the current in the primary field and induced current. The measure of these phase differences then indicates to the prospector that there is a certain mineral there but the amount of it has still to be ascertained. Several Methods. - 'There are other things that contribute - geochemistry, which is the analysis of water and soil which indicate the proximity of minerals. 'There is geobotany which is the analysis of leaves and roots which indicates the proximity of minerals. Discovery depends on all of these things being taken together and studied with the use of maps and the study of geological structure, sir, and a high degree of application and perhaps some luck, because many anomalies are graphitic. 'This must be followed up by drilling to indicate the quantity of the quality. As Mr. Glendenning said, delimited as to attitude and grade of ore all done in logical sequence. This, then is followed by a study of the treatment and disposition of these ores which includes research of processing and separation. 'There has been some suggestion that we should be concerned because so much time has elapsed. When we think of other mining operations of this magnitude we understand that seven to ten years is not long to work out these problems. I do not think we should be disturbed. We should be mindful that the first orebodies were discovered in 1953 and their problems are much more complex. Apart from the known minerals we have also, inthe Moncton area, oil. Mr. Elwell from Boston indicated to me they were having some measure of success. The oil shale has been staked and worked on for some considerable time and we hope the young men working on this will come up with something worthwhile.

Nickel Here? - 'Several parties have expressedinterest in our salt deposits.'The gypsum plant in Albert county has added new equipment and it would seem they have stabilized themselves.'The cement plant at Havelock is working full capacity and on last report had a full year's order ahead.'The nickel in the St. Stephen area and the copper in the southern coast still suggest interest tomany of the mining people.'The manganese in the Woodstock area at the moment is being treated in a pilot plant in the Niagara peninsula.'Just recently someone brought me a sample of asbestos and I trust it will prove successful. All this is indeed stimulating to our province. ...."

St. Croix Courier - Nov. 4, 1884 and Daily Telegraph - Nov. 21, 1884 New Brunswick at the New Orleans Exposition.- It was expected that the collection of geological specimens from New Brunswick, in course of preparation by Mr. W.F. Ganong for the New Orleans Exposition, would be ready for shipment the latter part of last week, but a delay of a few days was occasioned by the non arrival of some promised specimens. The collection is now nearly completed and will be shipped in a day or two. As classified, it is a good representation of the economic minerals of New Brunswick. To Mr. Ganong, great credit is due for the labor and time he has expended in preparing the exhibit, as well as to his father, Mr. J.H. Ganong, who will meet the charges of shipment and other expenses incurred. Without their disinterested offering of labor, time and money, the Province would have been entirely unrepresented at what promises to be the greatest display of the kind on this continent during the century. As it is, New Brunswick will make a creditable exhibit in one department, and many, who are entirely ignorant of the Province, will thereby be rendered familiar with its name and one feature of its resources. We append a list of the contents of the cabinet to be forwarded by Mr. Ganong:- New Brunswick at the New Orleans Exposition.- ... Ornamental and Building Stones, &c. Granite:- Dark red, three specimens, polished, dressed and rough; Light red, one specimen, polished; Salmon, one specimen, polished and rough; Gray(Spoon Island), two specimens, polished, dressed and rough - all from the works of Milne, Coutts & Co., St. George. Light reddish grey, one specimen, from the works of H.D. Wallace & Co., St. George. Freestones:- Four specimens, squared and dressed for building; two specimens, dressed for grindstones - all from the quarries of Jos. Read & Co., Clifton, Gloucester County. Whetstone:- Fine-grained, one specimen from Grand Manan, the property of Capt. Pettes. Siliceous Earth:- Two specimens, pure; two specimens with oxide of iron; from Black's Harbor, Charlotte County. Diatomaceous Earth:- Grand Manan. Limestone:- Two specimens, hydraulic and pure, fromFrye's Island; one specimen from South Bay, the property of John Lowry.Slate:- Two specimens, from S. Johnson, St. George. Combustible Materials.-Bituminous coal:- One specimen from Grand Lake. Anthracite coal:- One specimen from Lepreaux. Albertite coal:- Two specimens from Albert County. Mineral Masses.- Serpentine:- One specimen from Frye's Island; one specimen from St. Stephen. Asbestos:- One specimen from Frye's Island. Barytes:- One specimen from Grand Manan; one specimenfrom Frye's Island.Gypsum:- Four specimens. Snowy, anhydrite, selenite, from Hillsborough, Albert County. Ores.- Manganese:- Four specimens. Pyrolusite and manganite.- property of Alfred Markham, Markhamville, Kings County Iron:- Four specimens. Limonite from Grand Manan;hematite, from Woodstock, Carleton County;pyrrhotine, from St. Stephen; pyrite from Frye's Island. Lead:- Galena, three specimens, from Frye's Island, Mascarene and the Elm Tree mine, Gloucester County. Copper:- Bornite, two specimens, Kings County; copper pyrites, four specimens from Kings County: one specimen from St. George; one specimen fromMineral Vale, Kings County; peacock ore, two specimens, Mascarene; copper glance, twospecimens, from the Colonial Copper Mining Company, Dorchester. Antimony:- Three specimens. Sulphuret, 'hard' ore,sulphuret, 'soft' ore; native antimony, from Prince William, York County; one specimen of Sulphuret from Kings County. A few specimens are yet to be added, before the collection is shipped."

St. Andrews Beacon - Dec. 7, 1893 CHARLOTTE COUNTY.- ... Then look at the natural resources of this county... The famous red granite quarries of St. George are in this county, and no where in Canada can stone be found to match it. Charlotte county can also boast of the only black granite quarry in Canada, and though it has its reputation yet to make, we have no doubt as to its ultimate triumph over all foreign rivals. Then there are the nickel deposits in the neighborhood of St. Stephen, which may some day prove a mine of great wealth to Canada. At Letang there can befound some of the finest limestone that one could wish to see, and a little further east, in the neighborhood of Point Lepreaux, promising deposits of coal have been located ..."

St. Croix Courier - Apr. 7, 1892 Minerals of New Brunswick. - Extracts from a Paper by Prof. L.W. Bailey, of the Geological Survey of Canada. - COPPER. - The ores of copper found in New Brunswick include native copper, copper glance, chalcopyrite or copper pyrites, bornite or erubescite, cuprite and malachite. NATIVE COPPER has been reported as occurringsparingly in connection with the basalt traps which form the northern half of the Island of Grand Manan. It hasalso been observed at Clark Point on the Mascarene shore of Passamaquoddy bay, and it is stated to have been found in small quantities along the coast, near the head of the Bay of Fundy. Little that is definite, however, is known of either locality. COPPER GLANCE accompanies the native copper in the traps of Grand Manan, where it has been found in small quantities of Grand Manan, where it has been described by Prof. E.J. Chapman as being sufficiently abundant to give promise of profitable extraction. Little effort, however, has as yet been made in this direction. The same mineral, and in larger quantities, has been found associated with other copper ores at different localities along the coast of Charlotte county, and on the adjacent islands among which may be mentioned Crow Harbor Island, Simpson's and Adam's Islands. It is,however, a less abundant mineral than the species nextdescribed. COPPER PYRITES OR CHALCOPYRITE is the most widelydistributed as well as the most abundant of the copperores of New Brunswick, and has been observed at many localities. The larger number of these occur along the southern seaboard, where a band of copper-bearing rocks, believed to be of pre-Cambrian age, is found to extend, with some interruptions, along the greater part of its length. Others are found in the interior, more particularly in connection with the older schistose rocks or the intrusive masses by which these have been invaded. A detailed list of these localities so far as they occur in the southern part of the province, will be found in the Report of Progress of the Geological Survey for 1870- 71. In the northern part of the province, the most noticeable localities are Bull's Creek, in the vicinity of Woodstock and the Tattagouche River, near Bathurst. InWestmorland county, ores consisting in part of this species occur in connection with rocks of the carboniferous age, near the town of Dorchester. BORNITE OR ERUBESCITE, sometimes known as peacock ore, accompanies the other ores of copper, more particularly about Passamaquoddy bay and the head of the Bay of Fundy, sometimes occurring to the exclusion of other varieties. Where abundant, it constitutes a very valuable source of the metal, and the ore of some of the most promising mines yet opened has been chiefly of this species. NICKEL. - Considerable deposits of pyrrhotitehave for many years been known to occur in different parts of Charlotte county, usually in connection with copper pyrites, but until recently have been considered to be without value. Attention, however, having been redirected to them in consequence of the developments at Sudbury, in Ontario, these have also been found to be nickeliferous, and attempts are now made to test their value. The deposits appear to be large, but, as at Sudbury, the nickel contents vary considerably. A fair average sample of 75 lbs., analyzed under the direction of Dr. Hoffman, of the Dominion geological survey, yielded nickel, 4.718 per cent., the material very closely resembling, according to Dr. Hoffman, a large proportion of the ore at Sudbury, Ont. BUILDING STONES. - Very extensive and valuablebeds of granite, freestones, slate, marble, etc., existsin the province, and in the case of the first two have been largely quarried for exportation, but have not beenthought to require extended notice in the presentconnection. The same is true of another of the rocks or minerals, including limestone, clays, infusorial earths, bog-ores, salt, &c. These may be made the subject of a subsequent contribution. LIMONITE. - In addition to the limonite referred to above as associated with the hematites of Carletoncounty, this same mineral is found at various localities in the form of bog ore. The largest deposits are upon the banks of the St. John river at Burton, in Sunbury county, and considerable quantities of the ore were removed during the continuance of operations at Woodstock, for admixture with the hematites of that locality. Spathic iron is only known to occur in the form of small veins in certain parts of Queen's and Charlotte counties. At West Beach, twelve miles east of the city of St. John, upon the shore of the Bay of Fundy, are beds consisting of red hematite mingled with specular iron ore, while at Black River, two or three miles east of West Beach, some of them with a thickness of 20 feet. They have not, however, as yet attracted the favorable notice of such iron experts as have visited them. Magnetite is not uncommon in the form of scattered grains in the crystalline rocks of the southern counties, and small veins are

N.B. Courier - Feb. 19, 1842 Geology Of New Brunswick. - A report of the labours of Dr. Gesner, in exploring the mineral resources of the Province, during the past year having been made public, we have much satisfaction in referring to the work as affording further satisfactory evidence in confirmation of the generally received opinion that New Brunswick is rich in mineral resources. In his late researches, we are glad to find that in order to meet the views of His Excellency the Lieutenant-Governor, Dr. Gesner has directed his attention to the agricultural character of the districts explored; and the features of the uncleared lands have accordingly been examined, with a view of making them at once available for settlement; and so favorable have been the results of these enquiries, that several new settlements have already been projected in districts selected for this purpose. Dr. Gesner returned to the City last week after locating a party of settlers at Eel River, and another party are now preparing for departure to the same vicinity. A present benefit will thus be reaped from the labours of our Provincial Geologist by many deserving families, who might otherwise have proceeded to the United States, or remained as drones about the City, and at times a positive burthen upon the community. Having copied from the Royal Gazette the short reports made to His Excellency from time to time, during the progress of last year's exploration, it is not perhaps necessary for us to make any lengthy extracts from the detailed Report, in which Dr. Gesner has ably and minutely set forth, all his discoveries as well of a topographical as of a geological nature. We cannot, however, omit noticing the valuableand extensive deposit of Iron Ore near Woodstock, in the county of Carleton, which, on several accounts, offers advantages for the manufacture of iron and steel scarcely to be found in any part of Europe, and which is capable of supplying the whole of North America for many centuries to come. - With respect to the Great Coal Field of New Brunswick, we quote a paragraph from the Report 2 giving a description of that very extensive deposit, which will give some idea of the immense mine of wealth possessed by our Province:- [see Gesner's Report.....] It must be gratifying to Dr. Gesner to find thatthe Marl and Lime discovered by him in the counties of Charlotte and Saint John, are coming into use, and that the former is found to be of great value in agriculture, as proved by a letter from Mr. Joseph Walton, an intelligent farmer at St. Andrews, in the Report beforeus. We have before noticed the immense advantage resulting to the Province from the Granite found on the Saint John. The demand for the article in this City, increased greatly during the past year, and in some cases could not be supplied. When the vast coal field above described, and the immense beds of Iron Ore and other valuable minerals known to exist in the Province, are brought into use and made to supply the existing demands, then will the benefits of the present geological exploration be fully developed. It is expected that the Survey will be brought to a close next season, when a Geological Map of the Province will be completed, and the characteristic features of the Province, in a geological point of view, will then be easily

Carleton Sentinel Dec. 3, 1853 As we promised last week, and for the information of those of our readers who have not seen them we now proceed to give a short sketch of the Iron Works, &c., at the Upper Town and the operations there carried on. TheIron Ore is brought a distance of three miles from theirinexhaustible mines in Jacksontown, and laid on a layer of wood placed on skids to admit air underneath and piled alternately with layers of wood and charcoal to a height of 6 or 7 feet in long piles, about 20 feet wide, here it is roasted or calcined until it becomes easily broken into suitable sizes for the Blast Furnace. Charcoal is made in 6 large kilns, holding from 40 to 50 cords each, 3 taking about 8 to 10 days from the time of packing in the wood, to taking out the charcoal, which, when made, is taken to large Storehouses for use. On the yard we also saw some of the new Iron Ore, lately discovered in immense quantity about 300 yards from the Furnace - this ore a Clay Iron Stone, we were informed, when mixed in certain proportions with the other, produced an Iron superior to any ever manufactured here. There were piles of a new limestone from the Sheriff's Hill, only about 600 yards from the Furnace, lately found - the nearness of this last effecting a great saving of transport, the Company having formerly to go 10 miles for Limestone. We next visited the Tunnel-head, where the furnace is filled or charged with the Charcoal, Ores, and Limestone, the Furnace is 35 feet high and 10 feet wide at its greatest width. The Engine house contains 3 Steam Engines for the Blast Furnace, of which only one was working, being sufficient to drive two large Iron Blowing Cylinders, which acting like immense Bellows were continually forcing air into a large Receiver, from whence it is conducted through pipes to the bottom of the Furnace, and there blown in through 3 Tuyeres, set close to the fusing mass of materials and having water continually passing through them to prevent their melting. Steam is raised in the Engine-house by the Gas or waste heat from the Furnace, being conducted under and returned through the Boilers - the same heat taken from the Furnace in another direction, when requisite, heats the air passing through the heating ovens, thus giving Steam and Hot-blast without any extra expense, and effecting a very great saving of fuel. - There was a third Engine supplied with steam, from the same Boilers, and used to set in motion a Circular Saw, and a large hammer for Blooms from a Puddling Furnace adjoining. On our way to the Casting-house, we were shown a Lime-kiln, Mortar-mill, Blacksmith's shop and Brick-yard, all very convenient for the Company's operations, and on their own premises. In the

Casting-house we observed a man moulding Pig patterns to run the liquid Iron into - another was wheeling out the Cinders as they cooled. Being near Casting time we walked about, saw large heaps of the Cinders or Slag extending in the River, on the bank of which, the Pig Iron is piled in 3 ton heaps ready for shipping - the landing is one of the best on the river and accessible at all times during the navigation season. Close by the Casting-house is the line laid down in the preliminary survey of the St. Andrews and Quebec Railway, which, when completed will put these works in communication with the seaboard during the shutting up of the river navigation. It is now time to cast, or draw off the Iron melted during the previous 12 hours, and on returning we found men busily engaged tapping the Furnace, below where the melting Cinder was lava-like flowing over. The liquid Iron flowed along a Gutter in the sand, and soon filled one of the Beds of moulds or Pigs we saw making, it was then directed into another, and continued running until a third was filled, being, as we were informed, over three tons - this is done twice in 24 hours. As the Iron was near done running a large flow of Cinder came rushing out and was led over one side of the Gutter where it soon formed a small pool of liquid fire. We now wended our way homeward and in passing, must not omit mentioning the Company's Store and Boarding house, between which the road already partly graded runs to the mines at Jacksontown, - here the Railway is to be placed for the transport of the Ores and Limestone which lie in one continuous route. As we stated in our last the result of the present experiments has proved highly satisfactory, Iron can be produced of excellent quality and abundant quantity, and the Company are so far encouraged as to meditate an enlargement of their Capital Stock which the Act of Incorporation empowers, with a view to operations on an extended scale and the manufacture of the Iron into Bars. We wish them that success which their enterprise well deserves, and with which we think the destinies of this flourishing County particularly interwoven. No need of going to California or Australia if the mineral wealth of our County be only properly developed. Carleton possesses a Steel-making Iron Ore in quantity sufficient to render Great Britain independent of Sweden or Russia for generations, and which only requires an outlay of some of the superabundant capital of Britain to make it as well known in London and Sheffield as the best works of those Countries. We repeat, our County is rich in Mineral wealth.We have seen a very rich specimen of lignite, the outcropping of Coal found not over 3 miles from where we write, which, ignited well and burnt away leaving but very little residue. We have also been shown Silver-leadfluxed and melted from Ore found in this our County. These sources of Mineral wealth and our high Agricultural Capabilities warrant the inference that Carleton is soon to be destined to take rank as one of the richest Counties in the Province of New Brunswick."

Carleton Sentinel - Oct. 22, 1850 MINING IN NEW BRUNSWICK. - By information received from the New Brunswick papers and from private letters, we learn that the Mineral resources of the sister Province are at last about to be developed. During the past six months more than twenty Mining leases have been granted by the Government, in the counties of Albert and Westmorland. Upwards of two thousand chauldrons ofBitumen, or Mineral Pitch, have already been raised at Hillsborough, and will soon be ready for shipment to the United States, to be employed in the manufacture of gas.Beds of excellent coal from two to six feet in thickness, have been pierced at Meranquin, and a party of English Miners have been engaged to commence the working. A Mr. Steadman has also opened a vein of coal in the neighborhood of Shediac, and is now exploring anasphaltum mine near the Petitcodiac River. Surveys we understand are made with great energy, and there is much competition among the purchasers of mining leases. It is stated that 100,000 tons of asphaltum might be shipped next season from one mine. At present the completion of a railway three miles in length, is required to aid itstransport to the river. The Black Lead mine of St. John, has been well penetrated, and it is understood that the proprietors have made a profitable investment. The ironworks of Carleton County, which were unfortunately consumed by fire last season, have been rebuilt, and have commenced the manufacture of iron from the ore of Woodstock. These facts are encouraging to the inhabitants of New Brunswick, and fully confirm the predictions formerly made by Dr. Gesner in his geological reports published some ten years since. But in an equal degree they disprove the statements of Dr. Robb, and conflict with the statements put forth by him in Professor Johnston's recent Agricultural report. The mineral resources of this fine Province are evidently under-rated. The opening of the above mines has aroused a new energy, and all no doubt contribute largely to the prosperity of that Province, where all the mines and minerals are under the control of the Legislature, and open to the competition of its inhabitants. - HALIFAX COLONIST."

N.B. Courier - Sep. 27, 1851 We have been favored by the Directors of the Mechanics' Institute with the following Report, which we have much pleasure in publishing: Report on the Industrial Exhibition, Held at Saint John, On September 9th, (and following days,) 1851. To the New Brunswick Society for the Encouragement od Agriculture, Home Manufactures and Commerce throughout the Province. On the 11th of June last, W.J. Ritchie, M.P.P., the President of the St. John Mechanics Institute made application to the New Brunswick ... Class 1. Raw Materials: Sec. A. Minerals. The Exhibition was by no means complete in this department, although the Museum of the Institute, which was thrown open to the public, contains a great variety of the useful Minerals of the Province. We could wish to have seen at a glance, a series of the Provincial Rocks and Minerals of economic importance, and shall expect it at some future Exhibition. The Minerals exhibited on the present occasion were, many of them, of considerable interest. We may mention - A mass of native Black Lead, of which a large and valuable vein exists near Indian Town, and is now profitably mined by a Joint Stock Company. Samples of prepared Black Lead, exhibited by the St. John Black Lead Mining Company: this article seems well adapted to supply all the wants of our Provincial housekeepers. Asphatum or Asphaltic Coal, (for there is adoubt as to its true nature,) is a valuable Mineral, mined by a private Company in the Parish of Hillsborough, Albert County, and is already largely in demand for the manufacture of Gas. Soft bitumen, or Naptha, from the Petitcodiac, where it issues from the earth in a liquid form, and afterwards hardens by exposure to air. Asphaltic Shale, from Albert and Westmorland Counties; this is an article, the use of which in making gas, waterproof cements, pavements, &c., is increasing every day. Mineral Paint (an earthy oxide of iron, orferruginous earth,) from Shediac; this substance occurs in various parts of the Province, and is yet destined to replace all the forms of ordinary paint as a covering for wood work, &c. exposed to risks by fire. This present sample was exhibited by the Messrs. Gilbert. Mineral Paint, (an earthy oxide of Manganese,) from Albert County; an article which may yet be brought into use. Black lead, we may observe, is considered to be a good kind of mineral, or fire-proof paint; and we would suggest to the St. John Black Lead Company, that they should make some experiments upon the subject. Alabaster, or White translucent Gypsum; this is another of the varied Mineral products of Albert County; we observe specimens of it now for the first time on public exhibition, with great satisfaction; there is a square block of it, a vase turned from it, by Mr. McCoach, and a head carved in alto-relievo, on the same material, by Mr. Foulis. Its admirable purity and general qualities are well seen in these specimens, but none of them exhibit the beautiful polish of which it is susceptible. There is also a magnificent group of Chrystals of Gypsum, from Kings County, but their economic value is small as compared with the massive form from Hillsborough. Lime. - There is a cask of beautiful white Limeexhibited. This is one of our staple productions, and the St. John Lime is unsurpassed for its purity and general fitness for the purposes of the builder. The Limestone contains less than two per cent. Of impurities.Salt, by Joe Brand, of Sussex Vale; this salt is of first rate quality for farmers' purposes, and we are much pleased to learn that its manufacture has been resumed at the springs, and that Mr. Brand is enabled to sell it as low as the imported salt.Honestones, from the Kennebeckasis; these seem to be of good quality, and work either with water or oil. They bite well, and will compete with the Honestones of Woodstock or Miramichi, which are now coming into repute. Lead Ore. - Of this there are samples from King'sand Charlotte Counties, and Iron Ore from one or two places; but no information is given as to the probable supply from the various localities. The samples of Iron and Steel, from Woodstock,seem to be of the very first quality; the Iron has been bent and twisted, when cold, in every direction, but without showing the least injury to the fibre. It would be hard to devise a more complete proof of the quality of the article. We understand that the manufacture of Woodstock Iron will now be carried on vigorously by a Sheffield firm, who have become aware of its admirable qualities and adaptation for the making of Steel. Pipe Clay. - This article is from Albert County, and is exhibited by Mr. Foulis. It has a very good color, and seems to be well adapted for the manufacture of

N.B. Courier - Sep. 27, 1851 We have been favored by the Directors of the Mechanics' Institute with the following Report, which we have much pleasure in publishing: Report on the Industrial Exhibition, Held at Saint John, On September 9th, (and following days,) 1851. To the New Brunswick Society for the Encouragement od Agriculture, Home Manufactures and Commerce throughout the Province. On the 11th of June last, W.J. Ritchie, M.P.P., the President of the St. John Mechanics Institute made application to the New Brunswick ... Class 1. Raw Materials: Sec. A. Minerals. The Exhibition was by no means complete in this department, although the Museum of the Institute, which was thrown open to the public, contains a great variety of the useful Minerals of the Province. We could wish to have seen at a glance, a series of the Provincial Rocks and Minerals of economic importance, and shall expect it at some future Exhibition. The Minerals exhibited on the present occasion were, many of them, of considerable interest. We may mention - A mass of native Black Lead, of which a large and valuable vein exists near Indian Town, and is now profitably mined by a Joint Stock Company. Samples of prepared Black Lead, exhibited by the St. John Black Lead Mining Company: this article seems well adapted to supply all the wants of our Provincial housekeepers. Asphatum or Asphaltic Coal, (for there is adoubt as to its true nature,) is a valuable Mineral, mined by a private Company in the Parish of Hillsborough, Albert County, and is already largely in demand for the manufacture of Gas. Soft bitumen, or Naptha, from the Petitcodiac, where it issues from the earth in a liquid form, and afterwards hardens by exposure to air. Asphaltic Shale, from Albert and Westmorland Counties; this is an article, the use of which in making gas, waterproof cements, pavements, &c., is increasing every day. Mineral Paint (an earthy oxide of iron, orferruginous earth,) from Shediac; this substance occurs in various parts of the Province, and is yet destined to replace all the forms of ordinary paint as a covering for wood work, &c. exposed to risks by fire. This present sample was exhibited by the Messrs. Gilbert. Mineral Paint, (an earthy oxide of Manganese,) from Albert County; an article which may yet be brought into use. Black lead, we may observe, is considered to be a good kind of mineral, or fire-proof paint; and we would suggest to the St. John Black Lead Company, that they should make some experiments upon the subject. Alabaster, or White translucent Gypsum; this is another of the varied Mineral products of Albert County; we observe specimens of it now for the first time on public exhibition, with great satisfaction; there is a square block of it, a vase turned from it, by Mr. McCoach, and a head carved in alto-relievo, on the same material, by Mr. Foulis. Its admirable purity and general qualities are well seen in these specimens, but none of them exhibit the beautiful polish of which it is susceptible. There is also a magnificent group of Chrystals of Gypsum, from Kings County, but their economic value is small as compared with the massive form from Hillsborough. Lime. - There is a cask of beautiful white Limeexhibited. This is one of our staple productions, and the St. John Lime is unsurpassed for its purity and general fitness for the purposes of the builder. The Limestone contains less than two per cent. Of impurities.Salt, by Joe Brand, of Sussex Vale; this salt is of first rate quality for farmers' purposes, and we are much pleased to learn that its manufacture has been resumed at the springs, and that Mr. Brand is enabled to sell it as low as the imported salt.Honestones, from the Kennebeckasis; these seem to be of good quality, and work either with water or oil. They bite well, and will compete with the Honestones of Woodstock or Miramichi, which are now coming into repute. Lead Ore. - Of this there are samples from King'sand Charlotte Counties, and Iron Ore from one or two places; but no information is given as to the probable supply from the various localities. The samples of Iron and Steel, from Woodstock,seem to be of the very first quality; the Iron has been bent and twisted, when cold, in every direction, but without showing the least injury to the fibre. It would be hard to devise a more complete proof of the quality of the article. We understand that the manufacture of Woodstock Iron will now be carried on vigorously by a Sheffield firm, who have become aware of its admirable qualities and adaptation for the making of Steel. Pipe Clay. - This article is from Albert County, and is exhibited by Mr. Foulis. It has a very good color, and seems to be well adapted for the manufacture of

St. Croix Courier - Dec. 13, 1956 Three Concerns Examine Big Deposit at L'Etang Harbor. - See 'Definite Interest' In Area Lime. - St. George.- 'Definite Interest' is being expressed by private enterprise in the development of a large deposit of limestone at L'Etang Harbor, President Harold Atkinson of the Charlotte County Board of Trade has announced. 'At least three different concerns are interested enough to have examined the deposit within the past six months,' Mr. Atkinson said. Approximately 35 million tons - 'only a fraction' of the total deposit - exist above sea level and 'continuity in depth and quality was proved by diamond drilling this summer.' Describing the quality of the limestone as 'extremely high', Mr. Atkinson said the deposit forms part of the shoreline of L'Etang Harbor, referred to in British Admiralty charts 'as the finest natural harbor in British North America.' The firms interested in the deposit, described as high calcium content limestone, would extract for different purposes: as a 'flux' used in industrial processes of various kinds such as the manufacture of paper and the refining of ores, as the main ingredient in the production of chemicals. Reputable Firms. - Mr. Atkinson said all the firms interested and the uses they would make of the deposit are 'reputable.' He would not hazard a guess about the extent of plant and payroll required at L'Etang Harbor if a development took place. The number of men employed for example, would depend on which of the three uses companies interested would make of the deposit. A cement plant established at the site would, of course, bring the highest payroll to the county, he said. The property on which the deposit exists is owned by Mrs. J. Sutton Clark, of St. Stephen and negotiations with interested parties are being conducted by Clarence T. Clark of Edmundston In a statement explaining the basis of current interest in the deposit released to the Courier this week, Mr. Clark said the demands for cement in Canada and the United States was the 'driving force' behind it. He added the prospect of a manganese smelter at Woodstock was causing a search for good limestone to be used as a flux in the refining process. His statement: 'The U.S. tariff on imports of lime and limestone continues to be a deterrent to the development of this deposit. The excellent harbor and approaches with possibilities for harbor and shipping facilities offers the greatest inducement to development. 'The continuing demand for cement in Canada and United States, necessitating huge imports from Europe, is the driving force in the current interest. Negotiations are proceeding on a basis of use of one million tons of limestone per year, projected over 50 years. 'The proposed smelter or refiner of manganese ores in the Woodstock area has necessitated a search for high grade limestone within shortest possible radius of Woodstock. 'All negotiations to date are purely on an investigational basis and until all contributing factors have been explored, no concrete plans for actual plant layout and construction can be undertaken.'"

N.B. Courier - Jul. 19, 1856 ADVERTISEMENT: The York and Carleton Mining Company. Capital, £30,000 In 1200 shares of £25 each, With Power to Increase, by the Issue of New Shares, to £100,000. Eighty seven and one half per cent of the present Capital has been paid up. Directors: James Smith, Allan McLean, John Owens, Thomas Allan, Thomas Vaughan, James Thos. Smith, Henry Vaughan, J.R. Tupper, President - James Harris Treasurer - James Smith Secretary - James Robinson. Office - Prince William Street, St. John. The above Company was incorporated by an Act of the Provincial Legislature, passed in the year 1847, and is now engaged in the manufacture of Charcoal Pig Iron, at their Works in the Parish of Woodstock, in the County of Carleton, N.B. In order to extend their operations to the manufacture of all descriptions of malleable iron, they propose to increase their Capital Stock to £60,000, by the issue of 1200 additional shares. Their Works are situated at the Upper Village of Woodstock, where they own from 30 to 40 acres of Land, intersected by a fine stream of water. They consist of One Blast Furnace, with a hotblast apparatus; Two 5 feet diameter blowing Cylinders, driven by two Engines of 30 horse power each, which affords a surplus of blast sufficient for two more furnaces; One Tilt Hammer, driven by a ten-horse engine; One Puddling Furnace; Eight Brick Kilns for making Charcoal; Two large Coal Houses, and Two sheds; One large Kiln for roasting ore; One large Storehouse; One boarding house, with Barn and Outhouses; Three small houses, and Three Barns; One Lime Kiln, and Brick Yard; and a never-5 failing supply of Water, brought to the Works by an aqueduct, from a distance of about half a mile. They have also three Tracts of Land containing 600 acres, about 100 acres of which are under cultivation, and the remainder is covered with the finest forest woods; it lies within from one to three miles from the furnace. In addition to this, they own another tract of 10,000 acres, of fine hardwood land, specially selected by the Company; and purchased by them from the Crown, and paid for by a bonus (which the Provincial Government gave) of Five Pounds per ton, on the first three hundred tons of Iron made at the Works. This land, for which no part of the paid up capital was expended, the Company now propose to throw into the common stock, in order that all the subscribers to the new stock may participate in it, in proportion to the number of Shares they may respectively take. The Mining Lease of the Company covers a tract six miles in length by one mile and a half in breadth, is for a period of ninety-nine years, and is subject to a royalty of one penny per ton on all Iron produced. The Ore is of the very best quality; the supply is inexhaustible; and wood fuel of the very finest descriptions, not only abounds in the immediate vicinity of the works, and in all the surrounding country, but both it and charcoal can be obtained at very low rates from the upper country, through which the Saint John River, for a distance of upwards of seventy miles, and its numerous tributaries, flow. Limited as the present works are, the Company can now produce about 1800 tons of charcoal Pig Iron annually, and by the construction of an additional Blast Furnace, they would be enabled to double that quantity. Having already large surplus appliances to their present Furnace, the cost of an additional one, with which they could be connected, would not exceed £2,000. Heretofore, owing to their limited capital, they have been obliged to confine their operation to the production of Pig Iron, which has been purchased by English manufacturers, and by them has been converted into the different and much more valuable varieties of Iron and Steels, specimens of which may be seen at the Company's office, St John. Their Pig Iron, though returning a very large profit

upon the cost of production, is much less remunerative than the Bar, and Plate Irons and Steels. At present the English manufacturer derives all that additional profit. The proposed increase of capital, which at the present time need not exceed £15,000, will enable the Company to produce all those different varieties. The Pig Iron which they have exported has been produced at their works at from £4 10s. 0d. To £4 17s. 6d. Currency per ton, has been sold by them at £7 sterling per ton in England, and been there re-sold at £7 6 10s. They can produce, with the additional works contemplated, all the different descriptions of Irons and Steels, and at prices proportionally low. With the proposed new works, the cost of production would be very materially reduced, as a double quantity could be produced with a trifling increase of labour, the Superintendent, Furnace Master, Clerks, and other leading men, who are all now necessary for the one Furnace, being quite competent, with the assistance of a few laborers, to manage two or more. The Company have at their office, where they may be seen, the correspondence of several persons of high standing and extensive practical experience in the Iron business, and also tables made up by them, shewing the cost of production, and the average selling prices of the different descriptions of Irons and Steels. The following statement of the cost and prices of a few of the varieties will shew the very large profits which might be realized by the Company, if they were enabled, by an increase of their works, to produce them:- Cost of production per Average selling price ton, at the Works, cy. Per ton cy. Pig Iron, £4 17 6 Pig Iron, £8 10 0 Merchant Bar, 12 1 10 Merchant Bar, 22 10 0 Plate Iron, 14 0 0 Plate Iron, 27 10 0 Spring Steel Bars 11 10 9 Spring Steel Bars 28 6 0. The Iron produced at these works has already attained a very high reputation in England, and ranks among the best Irons in the world. It is peculiarly adapted for the finest qualities of Spring Steel, and is no doubt equally well adapted for Blister and Cast Steels. The Company offer this Stock to the public, in the fullest confidence that it will prove not only a safe but highly profitable investment for capital. Their facilities for cheap manufacture and transport are not surpassed in America; while the daily increasing demand for Iron and Steel, both in the Provinces and the United States, affords them ready and convenient markets for all that the most extensive works would enable them to produce. Our own Province alone would probably consume the whole product of the present and contemplated additional Furnace; and the consequent saving of freight, together with their other advantages, would enable the Company to compete successfully with the English and all other manufacturers. The fullest information as to the property and business of the Company - the supply of ores and wood - the quantity of Iron annually produced - and all other matters connected with the Company, can be obtained at their Office in Saint John. Form of Application For Shares To the Directors of the York and Carleton Mining Company, I request that you will allot me Shares in the above Company; and I agree to accept the same or any smaller number, and pay the deposit and calls thereon, and execute the deed when

Daily Evening Globe - Dec. 26, 1862 Mineral Localities of New Brunswick. - A Paper Read Before the Natural History Society of New Brunswick, At Its Last Meeting, By Mr. G.F. Matthew. - As no systematic list of the various mineral localities in the Province has heretofore been published, and the greater number still remain unknown to those who have not access to the few existing sources of information on the subject, I have endeavored to supply a want by collecting the numerous notes scattered through Gesner's report on the Geology of New Brunswick, adding thereto notices of localities discovered since his survey was brought to a close. In this work the writer has received valuable aid from his brother, as also from the late Dr.Robb and Mr. Wm. Payne of Portland. As the two branches of Natural Science, Geology and Mineralogy, are so intimately connected, it will be necessary, in order to obtain a comprehensive view of the character of the mineral deposits mentioned in the accompanying list, to give sketch of their geological distribution. The Province of New Brunswick is mostly occupied by unaltered rocks of aqueous origin. It is traversed, however, by three metamorphic bands which originate in a district of the same character, occupying the greater part of the County of Charlotte, and extending thence westwardly into the State of Maine. The northern land, pursuing a N.N.E. course through the Counties of York, Northumberland and Gloucester, terminates on the Bay of Chaleur. The 4 southern, of which the intermediate band passing through King's County is a subordinate spar, skirts the Bay of Fundy on its northern side as far as Chignecto Bay. A metamorphic district, of which little, however, is known, also exists about the head waters of the Tobique, Upsalquitch and Nepisiguit Rivers. The triangular area intervening between the two bands of altered and igneous rocks is occupied by an extensive coal formation, having deposits of Limestone and Gypsum, principally in the lower beds of the basin. On the triangular side of the first mentioned metamorphic band is another large and comparatively level district in which calcareous and argillaceous shales, of Silurian age, prevail. No great variety of minerals has been found in either of these flat districts, nor is it to be anticipated that there will be. Those, however, which do occur, are mostly of economic value (ores of iron, coal, gypsum, &c.) To the metamorphic bands and the district in which they unite therefore, we may look for the principal and more varied accessions to our mineral wealth. The following remarks regarding the southern metamorphic district are based upon the writer's own observations.The limestones of St. John Co. to which the localities in Portland pertain may have been produced by chemical deposition; for, although, they are only partially altered in many places, no fossils, except obscure vegetable remains have been detected in them. From the abundance of magnesian silicates we might suppose that these calcareous beds are, in part, ""dolomite."" The granite and gneiss of the limestone district contain tourmaline, epidote and laumontite, and small quantities of the sulphurets of iron, copper and lead, besides their ordinary constituents. Epidote is eminently characteristic of the trappean beds of Upper Devonian age, which extend in a double curve from Musquash to Bloomsbury Mt., and probably beyond. It is usually accompanied by quartz, specular iron and chlorite. Sheldon's Point is in this belt, and the minerals of Kingston and Clifton occur in stratified greenstone, probably of the same age; while those of Cape Spencer, West Beach and Black River are in overlying beds of sedimentary origin, largely charged with volcanic products. It will be seen that none of the zeolites found in the Triassic traps of Nova Scotia have yet been detected in the Devonian beds of volcanic origin on the North Shore of the Bay of Fundy; these latter seeming to hold (with the exception of chlorite and prehnite) anhydrous silicates only. The N.S. zeolites have been met with at only one locality in the Province - the Island of Grand Manan. It is not improbable, 5 therefore, that the trap of this island, like that of Isle au Haut and the North Shore of the Basin of Minas, is an outlier of the great masses which skirt the southern shore of the Bay of Fundy. Mineral Localities. - (This list was prepared three years ago for a supplement to Dana's Mineralogy which was not issued owing to the illness of the author of that work. I therefore feel that I am now at liberty to place it at your disposal. Alterations in the arrangement of some localities have been made, a few unimportant ones struck out, and others added. The marks used to distinguish the character of the specimens are similar to those in Dana's Mineralogy, viz: those which may be had in good specimens are underlined, (!) is added where they are remarkably good, (!!) where the specimens are unique. (NOTE - underlined articles are bracketed with square brackets, i.e. [coal] Albert County Grindstone Point and Island - Lignite, Iron Pyrites, Barytes. Hopewell - Gypsum, Selenite, [Alabaster].Albert Mines - Albertite !! Pollet River, 15 miles up - Coal. Shepody Mt. - Pyrolusite, [Calc spar], (rhombs with Manganese), Iron Pyrites, Native Alum, a clay. Turtle Creek - Coal. Carleton CountyWoodstock - Copper Pyrites, (mined) Wad, Bog Iron Ore. At Iron Mines - Hematite, Limonite. Charlotte County Beaver Harbour - Red jasper, Chlorite. Campobello island; at Welshpool - Iron Pyrites, Galena, Blende, Erubescite, Copper Pyrites. At head of Harbor de Lute - Galena, 4 in. vein. At Head Harbor - Iron Pyrites, Copperas. Deer Island, on N.W. side - Magnetic Iron, Calc Spar, (in Amygdaloidal) Hornstone, Quartz, (in trap). Digdeguash R., at Hog Island - Red jasper. On W. side of entrance - Calc Spar, (rhombs, in conglomerate,) Chalcedony, (in Greenstone,) At Rolling Dam - Graphite. Grand Manan Island, between Northern Head and Dark Harbour - Amethyst, Agate, Jasper, Hornstone, [Thompsonite, Stilbite, Heulandite, Calc Spar, Zeolite (Mesotype?), Apophyllite], Specular Iron, Magnetic Iron. At Whale Cove - Calc spar ! Heulandite ! Laumontite ! Stilbite ! Semiopal ! At Fish Head (2 miles S. of Eel Brook) - Chlorite, (abundant in qtz). At Ross's Island - Quartz Crystals. White Head - Chlorite, Quartz Crystals. At Kent's Island - Veined Marble. L'Etang Island and Harbour - Marble, Serpentine, Chlorite, Iron Pyrites. Le Tete - Galena, Erubescite, Copper Pyrites, Barytes. 6 Magaguadavic R., at entrance - Veins of copper pyrites, Malachite, Azurite. One eighth of a mile E. - Galena. Red Head, (on Mace's Bay) - Red jasper. Seeley's Cove, Hill 1/2 mile N. of - Quartz crystals, Calc spar, Magnetic Iron, Iron Pyrites. St. Stephen, 4 1/2 miles N. of - Graphite (in greywacke). Molybdenite, (in gneiss.) Milltown - Pyrites. Simpson's Island, on the Shore - Copper glance, Malachite. [See note]. Waweig R., 3 miles up, at Cormick's Mills, - Pyrites, Feldspar, Schorl and Garnet, (in boulder). At Bartlett's Pond - Quartz crystals. At Oak Bay - Hepatic Pyrites, in greywacke.) Gloucester County Bathurst - Malachite, (in coal). Eight miles from, on Tete-a-gouche R. - Manganite, (in crystals and crystalline,) [Copper Pyrites]. Kent County Buctouche R. - Coal. Cocaigne R., on branch, 3 miles from bridge - Coal. Richibucto R., 3 miles above Ford's Mills and at Big Brook - Coal. At Bass R. - Iron pyrites. Half mile W. of Liverpool - Bog Iron Ore. Kouchibouguaasis R. - Coal. Kings County Belleisle Bay, on N. Shore - Galena, (in limestone), veins of chalcedony, Jasper and Hornstone, (in trap). One and a half miles W. of Bull Moose Hill, on farms of Northrup and Benson - Large bed of Magnetic Iron. Clifton - [Orthoclase], (xls) Epidote, [(Pistacite)]. (common xls.) [Chlorite], (abundant granular,) Prehnite, all in bedded greenstone, Quartz crystals, Specular Iron. Hammond R., at Sherwood's - Graphite, (in limestone). Hampton, and at Darling's Lake, in loose pieces - Agate, Carnelian, Red jasper. Kingston, on ridge S. of village - Magnetic Iron, Magnetic Pyrites; also, Chlorite and Red jasper. Nerepis, near Hatfield's Mill - Iron Pyrites, (in greywacke). Near Mather's Inn - Amethyst, Quartz Crystals, Feldspar. Norton - Near Choat's Mill, on road to Belleisle - Argentif. Galena. One mile N. of Baxter's Inn - Specular Iron (xls) and Red Hematite. Quispamsis - Pyrites, Copper pyrites, Galena, Laumontite. Sussex, 1/4 mile from church, on McReady's farm - 7 [Selenite !] (hexagonal xls. forming in the mud of a spring.) [There are two fine groups of crystals from this locality in the Museum of the Mechanics' Institute.] Eight miles from Station, on Dutch Valley road - [Manganite], Pyrolusite, [Barytes.] Upham - Brine springs.Four miles E. of Titus Mill - Gypsum Northumberland County Boiestown - Coal. Barnaby's R., opposite mouth - Coal. Chatham - Coal, Iron Pyrites. Newcastle - Coal. Queens County Grand Lake, at Grand Point - Fossil Trees, containing Barytes, Pyrites, Copperas. Salmon River, (on Crawford's farm) - Coal, Caly, Iron Stone, Pyrites, Copperas. Newcastle - Coal mines. Coal Creek - Coal, (formerly mined.) Long Reach, opposite VanWart's - Chlorite. Washademoak River - Coal, (2 1/2 miles from Long's Creek.) Few miles above mouth on S.E. of a small cove - Hornstone, Jasper, Chalcedony, Carnelian, Quartz Crystals. Restigouche County Belledune Point - Verd Antique, Serpentine, Iceland Spar! Dalhousie, near to - [Agate], Carnelian. Point le Nim - Coal. St. John County Carleton, near Falls - Red Calcite. Chance Harbour - [Calc spar] (deep red xls) in quartz veins, Chlorite (in argill and talcose state). Brandy Brook - Quartz crystals. - Epidote (Pistacite) and Hornblende in boulders. Black R. settlement. - [Quartz crystals], Chlorite, Calc spar, Copper Pyrites, Specular Iron !(tabl. xls) Little Dipper Harbour, on W. side - Barytes, quartz crystals, Amethyst (in compact greenstone). Moosepath - Schorl (crystals), Hornblende (crystals), Felspar (red), Muscovite, Albite (?) Musquash, on E. side, Harb. at entrance - Graphite, Pyrites, Copperas. At Shannon's - Serpentine, Verd-Antique, [Chrysotile.] E. side of Musquash - [Quartz crystals] (veins in conglomerate). Portland, [Crow's Nest - Serpentine,] Chrysotile, Steatite, Magnesite, Asbestos. [Drury's Cove] - Indurated Talc, Pyrallolite (?), Graphite, Pyrites.[At the Falls] - Graphite (impure bed 4 ft.) [Fort Howe Hill] - Graphite, Calcite (several forms, viz: dogs-tooth spar, nail-head spar, &c.) [Howe's Road], 1 1/2 miles from St. John - Epidote (in syenite). ! 1/2 mile from road [Tremolite], Steatite, Mica (?). [Lily Lake] - Serpentine, Chrysotile, Talc, (radiated), Steatite, Graphite. [White Augite] (?). Quaco, Light House Pt. - Manganese, ([Pyrolusite]), (bed 4 ft). W. of Point - Lignite. E. of Quaco, Fuller's Creek - Graphite, Iron Pyrites. Farther Eastward - Schorl, Asbestos, Chrysotile, Serpentine. Sheldon's Pt. -

[Epidote] (Pistacite and Zoisite), Actinolite, Asbestos, Calcite, Specular Iron, Malachite. Cape Spencer - Specular Iron (crystals), Calcite (crystals), Talc, Chlorite, Asbestos. Ten Mile Creek - Coal in slate and sandstone. West Beach - At Evan's - Quartz Crystals, Talc, Chlorite. Half Mile W. of Evan's - Vein of Magnesite with Talc, Chlorite and Magnetic Iron, Copper and Iron Pyrites, [Hematite], [Specular Iron]. [See note.] Point Wolf and Salmon R. - Iron and [Copper] [Pyrites], Asbestos, Chlorite, [Erubescite], Chrysocolla, [Cuprite.] Sunbury County Oromocto River, N. Branch, 10 miles up - Coal. Lincoln - Wad, Bog Iron Ore. Victoria County Tobique River - Red Jasper, Carnelian, Agate. At mouth, S. side - Galena. At mouth of Wapskehegan R. - Gypsum, Salt Springs. Three miles farther up - Stalactites (abundant). Quisibis River - [Blue Phosphate of Iron] (in clay). Westmorland County Bellevue - Iron Pyrites. Dorchester, Taylor's Farm - Cannel Coal, Clay Iron Stone. On Ayre's Farm - Petroleum, Asphaltum. Grand Anse - Gypsum, [Selenite] (large crystals), Apatite, (vide Gesner). Memramcook - Coal, [(Albertite).] Shediac - 4 miles up Scadouc R. - Coal. York County Harvey Settlement - Wad. Nashwaak River - Coal. Tay Creek - Coal. Pokiok River - Tin pyrites (in granite vein). Three miles from St. John River, in direction of Lake George - Stibnite ! [See note]. 9 In order to obtain a clearer view of the value of the mineralogical resources of the Province as thus far developed, let us take a glance at the more important facts to be deduced from the foregoing list. Many of the minerals noted in its columns are not of economic importance, and therefore will not receive any further notice. Serpentine and marble, both of which are largely used in ornamental work, are known to occur at many localities; but few of those which have been examined yield blocks sufficiently perfect to be useful to the manufacturer. Of such well known and widely distributed minerals as limestone and gypsum it is scarcely necessary to speak. Both, the former especially, are abundant in many parts of the Province. Heavy beds of limestone are common in the southern metamorphic belt, also on the Bay Chaleur. Unaltered deposits may be seen skirting the margin of the great coal field. Gypsum is confined mostly to the Lower Carboniferous series of King's, Albert, and Westmorland; but occurs also in the red sandstone district of the Tobique River. Chlorite or ""pipestone"" and Steatite or ""soapstone"" have been found at a number of places; but no deposit of the latter mineral, sufficiently large to be available for manufacturing purposes, has yet been discovered. Barytes, or ""heavy spar,"" has been met with only at a few localities, and not in any considerable quantity, unless we may except that in Sussex and a large deposit said to occur at Le Tete. This mineral is largely used in the manufacture of white paint, and also for other purposes. It resembles calcareous spar, but differs in cleavage and is much heavier. The only gem which this province has thus far yielded is that very common one called, according to its color, white stone or rock crystal, false topaz, and amethyst. Other varieties of this mineral, such as carnelian, agate and jasper, which are frequently used in jewellery, occur at several places. Garnet is reported from Waweig river, but it has not been found ""in situ"". All the tourmalines mentioned are of the ordinary black variety. It will be seen on examination of the catalogue, that all the metals in ordinary use as well as some others which are more infrequent, occur in this province. But of the commoner ones several have not been found in sufficient quantity to be worth extracting. Indications of tin were observed in the granite of the Pokiok river, by Dr. Gesner. Lead ore has been met with at Tobique River, Norton, Campo Bello, and other places, but not in sufficient quantities as to assure a profitable return to 10 the miner. Zinc blende is found at Campo Bello and a few other localities, but not even so abundantly as lead. This mineral is usually of a dark brown color, and is frequently associated, as at Campo Bello, with galena and copper pyrites. Several ores of copper, chiefly sulphurets and carbonates occur in various parts of the Province, but few of the mines opened in these deposits have been permanently worked. Those of Bathurst and Woodstock have been abandoned. But mining on a small scale is still continued at Salmon River and Le Tete, and experimental operations on the deposit at Simpson's Island have been commenced. Two ores of this metal have been newly added to the list of those already known to occur in the Province. These are the Suplhuret called copper glance, from Simpson's Island and cuprite, or the red oxide of copper found at Salmon River. Iron and manganese are the metals which above all others are most abundant. Heavy ore beds of the former are exposed at Woodstock, Nerepis Road, Bull Moose Hill, West Beach, and other localities referred to in the list. At the first mentioned place the ore has been worked for a number of years. Manganese occurs in greatest quantities and purity near the eastern terminations of the two metamorphic bands to which allusion has already been made. The earthy variety called Wad is also common. The mine near Bathurst which affords beautiful crystals of the grey oxide has been abandoned on account of the irregularity and unreliable character of the deposit. Operations, however, are still carried on at Sussex and Shepody. Of the precious metals, silver has been detected in some of the lead ores, in the ore of antimony near Pokiok, and in the copper ore of Simpson's Island, but only in minute quantities. Gold, so far as we are aware, is yet undiscovered; at least, there is no tangible evidence to show us that it has been found in the Province. If reliance may be placed on the results of the geological survey, the northern metamorphic band, the County of Charlotte, the region about the headquarters of the Tobique, and that part of the southern band which has not been shown to be of Devonian age, are the most promising districts for the gold seeker. The discovery of a rich gold field would undoubtedly give a great spur to the development of our Provincial resources, but, at the same time, would probably have a tendency to attract a lawless and reckless population. Seams of coal have been found at numerous localities within the great central area, covered by deposits of Carboniferous age. Few of these, however, promise to be productive. The unique variety found at Hillsborough has proved to be a mine of wealth to its owners. Operations have also been successfully carried on at the mines on Grand Lake for many years. But in no other part of the Province have beds of this mineral sufficiently large to attract the attention of capitalists, been opened. Those best qualified to judge (Drs. Robb and Dawson) of the productiveness of New Brunswick coal measures, gives us little reason to hope that they will yield stores of fossil fuel as large as, considering the extensive area which they cover, we might anticipate. Still the discovery of extensive beds is not altogether hopeless, for we should bear in mind that a great part of the area underlaid by these rocks remains unsettled and uncleared; and we may traverse parts of it for scores of miles through an unbroken wilderness. Although New Brunswick is not favored with the possession of mineral attractions so brilliant as some of her Colonial sisters, she is not altogether devoid of some solid advantages as the preceding summary will show. The many openings for the advantageous investment of capital, which are to be found in a young and flourishing colony is no doubt the reason why the abundant mineral wealth, with which bountiful Providence has endowed us, still remains undeveloped. As population increases, however, and our wants become more diversified, this source of a prosperous and remunerative commerce will receive the attention which it deserves. Already we see signs of the approach of such a period in the careful investigation which several newly discovered metallic deposits are receiving. [In these remarks I have endeavored as far as possible to occupy ground different from that taken up by Prof. L.W. Bailey in this valuable little publication on the mineral resources of the Province, as exemplified by the metallurgical collection of the University of New Brunswick; considering that a repetition of what has recently been made public would be superfluous.] Addenda. -Iron Ore of West Beach. - The bed of ore at this place inwhich the mine has been opened is included in the upper part of a large mass of coarse reddish-grey conglomerate, dipping to the S.E. at an angle of about 30ø, and distant a furlong from the shore. The pit or quarry from which the ore has been extracted has been opened in a bed of dark, reddish, brown hematite. One or more schooner loads have been taken away, and a quantity still remains awaiting shipment. The conglomerate is abundantly seamed with quartz containing scattered masses and veins of micaceous and specular iron in tabular crystals. Two or three miles eastward of the mine the iron ore again appears on the hill side. Here, however, three or four beds of ore (one of them 20 feet thick) are visible; and the associated rocks are different, consisting of beds of trap-ash, trap-ash slate, and talcomicaceous slate. The ore beds were not traced on the eastern side of Black River. Were it not for their variable thickness they might be sought for here with much probability of success. A continuation of the same rocks holds beds of limestone at Emerson's Creek, a few miles to the eastward. The facilities for working this ore are therefore, in some respects, unusually good, but no smelting operations have hitherto been undertaken. From its association it would appear that this ore was originally deposited in the state of a finely divided ferruginous mud, in a shallow sea and within the influence of active volcanoes. I hope to be able to show at some future time that the accompanying rocks do not possess the antiquity ascribed to them in the geological reports of Dr. Gesner, but are of a later date than the sandstones and shales of St. John, which have yielded such an abundant harvest of Devonian plants. [For the information regarding the two following localities, I am indebted to Edward Allison, Esq.] Copper Ore, Simpson's Island. -The vein of green carbonate (malachite) recently discovered, occurs in a small island, (not exceeding 100 acres in extent) about one mile south of Deer Island, andseven miles from Eastport. The island is composed of trap-rock, through which protrudes a band of slate, with nearly vertical layers, which extends across the island in an East and West direction; it being about four feet wide on the West side, and from ten to twelve feet wide where it terminates in a small cove on the East side of the Island. The copper lode occurs in this slate, and was discovered on the West side of the Island in a beach which extends (from high to low water) abut 400 feet. This beach is composed of rock covered with seaweed, except near high water mark, where it is shingle. The copper lode, where discovered, is about four feet wide, and about 150 feet from low water mark; it has been traced about 150 feet toward the shore and to low water mark. Several tons of this ore have been taken out and sent to Liverpool to be tested. A small sample sent some time since yielded 27 per cent of copper, and nearly four ounces of silver to the ton. The value of the ore as taken out is reported to be £27 stg. per ton. [Pieces of Copper glance (sulphuret of copper) were scattered through the Carbonate which forms the mass of the ore at the surface, and were found to increase when the evacuation was deepened. At a greater depth the ore probably consists of the former compound, as the carbonate seems to result entirely from decomposing agencies at work at and near the surface] - G.F.M. Antimony of York Co. -The vein of antimony recently discovered occurs in York Co., Parish of Prince William, about 20 miles above Fredericton, and is on the S.W. side of the river Saint John. The rise of the land from the river at this place is gradual, till the summit of the slope (about 300 feet high) is reached, when the ground falls away toward Lake George, and the Pokiok Stream. Near the top of the slope a band of primary rock, having a course about N.W. and S.E., protrudes through the soil, and is shown particularly where it crosses the highway. This band of rock contains the vein of antimony referred to. It was discovered in boulders evidently detached from this ridge, and upon uncovering the rock the antimony was discovered imbedded in it. The vein was traced about one quarter of a mile by trial pits, and probably extends further. It appears to be about two feet wide, with a dip to the North of about 45ø. The vein has not been penetrated to a depth of more than six feet. Samples of the ore have been analyzed by Drs. Hayes and Jackson of Boston - also by a person in Liverpool. The result differs

Daily Evening Globe - Dec. 26, 1862 Mineral Localities of New Brunswick. - A Paper Read Before the Natural History Society of New Brunswick, At Its Last Meeting, By Mr. G.F. Matthew. - As no systematic list of the various mineral localities in the Province has heretofore been published, and the greater number still remain unknown to those who have not access to the few existing sources of information on the subject, I have endeavored to supply a want by collecting the numerous notes scattered through Gesner's report on the Geology of New Brunswick, adding thereto notices of localities discovered since his survey was brought to a close. In this work the writer has received valuable aid from his brother, as also from the late Dr.Robb and Mr. Wm. Payne of Portland. As the two branches of Natural Science, Geology and Mineralogy, are so intimately connected, it will be necessary, in order to obtain a comprehensive view of the character of the mineral deposits mentioned in the accompanying list, to give sketch of their geological distribution. The

Province of New Brunswick is mostly occupied by unaltered rocks of aqueous origin. It is traversed, however, by three metamorphic bands which originate in a district of the same character, occupying the greater part of the County of Charlotte, and extending thence westwardly into the State of Maine. The northern land, pursuing a N.N.E. course through the Counties of York, Northumberland and Gloucester, terminates on the Bay of Chaleur. The 4 southern, of which the intermediate band passing through King's County is a subordinate spar, skirts the Bay of Fundy on its northern side as far as Chignecto Bay. A metamorphic district, of which little, however, is known, also exists about the head waters of the Tobique, Upsalquitch and Nepisiguit Rivers. The triangular area intervening between the two bands of altered and igneous rocks is occupied by an extensive coal formation, having deposits of Limestone and Gypsum, principally in the lower beds of the basin. On the triangular side of the first mentioned metamorphic band is another large and comparatively level district in which calcareous and argillaceous shales, of Silurian age, prevail. No great variety of minerals has been found in either of these flat districts, nor is it to be anticipated that there will be. Those, however, which do occur, are mostly of economic value (ores of iron, coal, gypsum, &c.) To the metamorphic bands and the district in which they unite therefore, we may look for the principal and more varied accessions to our mineral wealth. The following remarks regarding the southern metamorphic district are based upon the writer's own observations.The limestones of St. John Co. to which the localities in Portland pertain may have been produced by chemical deposition; for, although, they are only partially altered in many places, no fossils, except obscure vegetable remains have been detected in them. From the abundance of magnesian silicates we might suppose that these calcareous beds are, in part, ""dolomite."" The granite and gneiss of the limestone district contain tourmaline, epidote and laumontite, and small quantities of the sulphurets of iron, copper and lead, besides their ordinary constituents. Epidote is eminently characteristic of the trappean beds of Upper Devonian age, which extend in a double curve from Musquash to Bloomsbury Mt., and probably beyond. It is usually accompanied by quartz, specular iron and chlorite. Sheldon's Point is in this belt, and the minerals of Kingston and Clifton occur in stratified greenstone, probably of the same age; while those of Cape Spencer, West Beach and Black River are in overlying beds of sedimentary origin, largely charged with volcanic products. It will be seen that none of the zeolites found in the Triassic traps of Nova Scotia have yet been detected in the Devonian beds of volcanic origin on the North Shore of the Bay of Fundy; these latter seeming to hold (with the exception of chlorite and prehnite) anhydrous silicates only. The N.S. zeolites have been met with at only one locality in the Province - the Island of Grand Manan. It is not improbable, 5 therefore, that the trap of this island, like that of Isle au Haut and the North Shore of the Basin of Minas, is an outlier of the great masses which skirt the southern shore of the Bay of Fundy. Mineral Localities. - (This list was prepared three years ago for a supplement to Dana's Mineralogy which was not issued owing to the illness of the author of that work. I therefore feel that I am now at liberty to place it at your disposal. Alterations in the arrangement of some localities have been made, a few unimportant ones struck out, and others added. The marks used to distinguish the character of the specimens are similar to those in Dana's Mineralogy, viz: those which may be had in good specimens are underlined, (!) is added where they are remarkably good, (!!) where the specimens are unique. (NOTE - underlined articles are bracketed with square brackets, i.e. [coal] Albert County Grindstone Point and Island - Lignite, Iron Pyrites, Barytes. Hopewell - Gypsum, Selenite, [Alabaster].Albert Mines - Albertite !! Pollet River, 15 miles up - Coal. Shepody Mt. - Pyrolusite, [Calc spar], (rhombs with Manganese), Iron Pyrites, Native Alum, a clay. Turtle Creek - Coal. Carleton CountyWoodstock - Copper Pyrites, (mined) Wad, Bog Iron Ore. At Iron Mines - Hematite, Limonite. Charlotte County Beaver Harbour - Red jasper, Chlorite. Campobello island; at Welshpool - Iron Pyrites, Galena, Blende, Erubescite, Copper Pyrites. At head of Harbor de Lute - Galena, 4 in. vein. At Head Harbor - Iron Pyrites, Copperas. Deer Island, on N.W. side - Magnetic Iron, Calc Spar, (in Amygdaloidal) Hornstone, Quartz, (in trap). Digdeguash R., at Hog Island - Red jasper. On W. side of entrance - Calc Spar, (rhombs, in conglomerate,) Chalcedony, (in Greenstone,) At Rolling Dam - Graphite. Grand Manan Island, between Northern Head and Dark Harbour - Amethyst, Agate, Jasper, Hornstone, [Thompsonite, Stilbite, Heulandite, Calc Spar, Zeolite (Mesotype?), Apophyllite], Specular Iron, Magnetic Iron. At Whale Cove - Calc spar ! Heulandite ! Laumontite ! Stilbite ! Semiopal ! At Fish Head (2 miles S. of Eel Brook) - Chlorite, (abundant in qtz). At Ross's Island - Quartz Crystals. White Head - Chlorite, Quartz Crystals. At Kent's Island - Veined Marble. L'Etang Island and Harbour - Marble, Serpentine, Chlorite, Iron Pyrites. Le Tete - Galena, Erubescite, Copper Pyrites, Barytes. 6 Magaguadavic R., at entrance - Veins of copper pyrites, Malachite, Azurite. One eighth of a mile E. - Galena. Red Head, (on Mace's Bay) - Red jasper. Seeley's Cove, Hill 1/2 mile N. of - Quartz crystals, Calc spar, Magnetic Iron, Iron Pyrites. St. Stephen, 4 1/2 miles N. of - Graphite (in greywacke). Molybdenite, (in gneiss.) Milltown - Pyrites. Simpson's Island, on the Shore - Copper glance, Malachite. [See note]. Waweig R., 3 miles up, at Cormick's Mills, - Pyrites, Feldspar, Schorl and Garnet, (in boulder). At Bartlett's Pond - Quartz crystals. At Oak Bay - Hepatic Pyrites, in greywacke.) Gloucester County Bathurst - Malachite, (in coal). Eight miles from, on Tete-a-gouche R. - Manganite, (in crystals and crystalline,) [Copper Pyrites]. Kent County Buctouche R. - Coal. Cocaigne R., on branch, 3 miles from bridge - Coal. Richibucto R., 3 miles above Ford's Mills and at Big Brook - Coal. At Bass R. - Iron pyrites. Half mile W. of Liverpool - Bog Iron Ore. Kouchibouguaasis R. - Coal. Kings County Belleisle Bay, on N. Shore - Galena, (in limestone), veins of chalcedony, Jasper and Hornstone, (in trap). One and a half miles W. of Bull Moose Hill, on farms of Northrup and Benson - Large bed of Magnetic Iron. Clifton - [Orthoclase], (xls) Epidote, [(Pistacite)]. (common xls.) [Chlorite], (abundant granular,) Prehnite, all in bedded greenstone, Quartz crystals, Specular Iron. Hammond R., at Sherwood's - Graphite, (in limestone). Hampton, and at Darling's Lake, in loose pieces - Agate, Carnelian, Red jasper. Kingston, on ridge S. of village - Magnetic Iron, Magnetic Pyrites; also, Chlorite and Red jasper. Nerepis, near Hatfield's Mill - Iron Pyrites, (in greywacke). Near Mather's Inn - Amethyst, Quartz Crystals, Feldspar. Norton - Near Choat's Mill, on road to Belleisle - Argentif. Galena. One mile N. of Baxter's Inn - Specular Iron (xls) and Red Hematite. Quispamsis - Pyrites, Copper pyrites, Galena, Laumontite. Sussex, 1/4 mile from church, on McReady's farm - 7 [Selenite !] (hexagonal xls. forming in the mud of a spring.) [There are two fine groups of crystals from this locality in the Museum of the Mechanics' Institute.] Eight miles from Station, on Dutch Valley road - [Manganite], Pyrolusite, [Barytes.] Upham - Brine springs.Four miles E. of Titus Mill - Gypsum Northumberland County Boiestown - Coal. Barnaby's R., opposite mouth - Coal. Chatham - Coal, Iron Pyrites. Newcastle - Coal. Queens County Grand Lake, at Grand Point - Fossil Trees, containing Barytes, Pyrites, Copperas. Salmon River, (on Crawford's farm) - Coal, Caly, Iron Stone, Pyrites, Copperas. Newcastle - Coal mines. Coal Creek - Coal, (formerly mined.) Long Reach, opposite VanWart's - Chlorite. Washademoak River - Coal, (2 1/2 miles from Long's Creek.) Few miles above mouth on S.E. of a small cove - Hornstone, Jasper, Chalcedony, Carnelian, Quartz Crystals. Restigouche County Belledune Point - Verd Antique, Serpentine, Iceland Spar! Dalhousie, near to - [Agate], Carnelian. Point le Nim - Coal. St. John County Carleton, near Falls - Red Calcite. Chance Harbour - [Calc spar] (deep red xls) in quartz veins, Chlorite (in argill and talcose state). Brandy Brook - Quartz crystals. - Epidote (Pistacite) and Hornblende in boulders. Black R. settlement. - [Quartz crystals], Chlorite, Calc spar, Copper Pyrites, Specular Iron !(tabl. xls) Little Dipper Harbour, on W. side - Barytes, quartz crystals, Amethyst (in compact greenstone). Moosepath - Schorl (crystals), Hornblende (crystals), Felspar (red), Muscovite, Albite (?) Musquash, on E. side, Harb. at entrance - Graphite, Pyrites, Copperas. At Shannon's - Serpentine, Verd-Antique, [Chrysotile.] E. side of Musquash - [Quartz crystals] (veins in conglomerate). Portland, [Crow's Nest - Serpentine,] Chrysotile, Steatite, Magnesite, Asbestos. [Drury's Cove] - Indurated Talc, Pyrallolite (?), Graphite, Pyrites.[At the Falls] - Graphite (impure bed 4 ft.) [Fort Howe Hill] - Graphite, Calcite (several forms, viz: dogs-tooth spar, nail-head spar, &c.) [Howe's Road], 1 1/2 miles from St. John - Epidote (in syenite). ! 1/2 mile from road [Tremolite], Steatite, Mica (?). [Lily Lake] - Serpentine, Chrysotile, Talc, (radiated), Steatite, Graphite. [White Augite] (?). Quaco, Light House Pt. - Manganese, ([Pyrolusite]), (bed 4 ft). W. of Point - Lignite. E. of Quaco, Fuller's Creek - Graphite, Iron Pyrites. Farther Eastward - Schorl, Asbestos, Chrysotile, Serpentine. Sheldon's Pt. - [Epidote] (Pistacite and Zoisite), Actinolite, Asbestos, Calcite, Specular Iron, Malachite. Cape Spencer - Specular Iron (crystals), Calcite (crystals), Talc, Chlorite, Asbestos. Ten Mile Creek - Coal in slate and sandstone. West Beach - At Evan's - Quartz Crystals, Talc, Chlorite. Half Mile W. of Evan's - Vein of Magnesite with Talc, Chlorite and Magnetic Iron, Copper and Iron Pyrites, [Hematite], [Specular Iron]. [See note.] Point Wolf and Salmon R. - Iron and [Copper] [Pyrites], Asbestos, Chlorite, [Erubescite], Chrysocolla, [Cuprite.] Sunbury County Oromocto River, N. Branch, 10 miles up - Coal. Lincoln - Wad, Bog Iron Ore. Victoria County Tobique River - Red Jasper, Carnelian, Agate. At mouth, S. side - Galena. At mouth of Wapskehegan R. - Gypsum, Salt Springs. Three miles farther up - Stalactites (abundant). Quisibis River - [Blue Phosphate of Iron] (in clay). Westmorland County Bellevue - Iron Pyrites. Dorchester, Taylor's Farm - Cannel Coal, Clay Iron Stone. On Ayre's Farm - Petroleum, Asphaltum. Grand Anse - Gypsum, [Selenite] (large crystals), Apatite, (vide Gesner). Memramcook - Coal, [(Albertite).] Shediac - 4 miles up Scadouc R. - Coal. York County Harvey Settlement - Wad. Nashwaak River - Coal. Tay Creek - Coal. Pokiok River - Tin pyrites (in granite vein). Three miles from St. John River, in direction of Lake George - Stibnite ! [See note]. 9 In order to obtain a clearer view of the value of the mineralogical resources of the Province as thus far developed, let us take a glance at the more important facts to be deduced from the foregoing list. Many of the minerals noted in its columns are not of economic importance, and therefore will not receive any further notice. Serpentine and marble, both of which are largely used in ornamental work, are known to occur at many localities; but few of those which have been examined yield blocks sufficiently perfect to be useful to the manufacturer. Of such well known and widely distributed minerals as limestone and gypsum it is scarcely necessary to speak. Both, the former especially, are abundant in many parts of the Province. Heavy beds of limestone are common in the southern metamorphic belt, also on the Bay Chaleur. Unaltered deposits may be seen skirting the margin of the great coal field. Gypsum is confined mostly to the Lower Carboniferous series of King's, Albert, and Westmorland; but occurs also in the red sandstone district of the Tobique River. Chlorite or ""pipestone"" and Steatite or ""soapstone"" have been found at a number of places; but no deposit of the latter mineral, sufficiently large to be available for manufacturing purposes, has yet been discovered. Barytes, or ""heavy spar,"" has been met with only at a few localities, and not in any considerable quantity, unless we may except that in Sussex and a large deposit said to occur at Le Tete. This mineral is largely used in the manufacture of white paint, and also for other purposes. It resembles calcareous spar, but differs in cleavage and is much heavier. The only gem which this province has thus far yielded is that very common one called, according to its color, white stone or rock crystal, false topaz, and amethyst. Other varieties of this mineral, such as carnelian, agate and jasper, which are frequently used in jewellery, occur at several places. Garnet is reported from Waweig river, but it has not been found ""in situ"". All the tourmalines mentioned are of the ordinary black variety. It will be seen on examination of the catalogue, that all the metals in ordinary use as well as some others which are more infrequent, occur in this province. But of the commoner ones several have not been found in sufficient quantity to be worth extracting. Indications of tin were observed in the granite of the Pokiok river, by Dr. Gesner. Lead ore has been met with at Tobique River, Norton, Campo Bello, and other places, but not in sufficient quantities as to assure a profitable return to 10 the miner. Zinc blende is found at Campo Bello and a few other localities, but not even so abundantly as lead. This mineral is usually of a dark brown color, and is frequently associated, as at Campo Bello, with galena and copper pyrites. Several ores of copper, chiefly sulphurets and carbonates occur in various parts of the Province, but few of the mines opened in these deposits have been permanently worked. Those of Bathurst and Woodstock have been abandoned. But mining on a small scale is still continued at Salmon River and Le Tete, and experimental operations on the deposit at Simpson's Island have been commenced. Two ores of this metal have been newly added to the list of those already known to occur in the Province. These are the Suplhuret called copper glance, from Simpson's Island and cuprite, or the red oxide of copper found at Salmon River. Iron and manganese are the metals which above all others are most abundant.

Heavy ore beds of the former are exposed at Woodstock, Nerepis Road, Bull Moose Hill, West Beach, and other localities referred to in the list. At the first mentioned place the ore has been worked for a number of years. Manganese occurs in greatest quantities and purity near the eastern terminations of the two metamorphic bands to which allusion has already been made. The earthy variety called Wad is also common. The mine near Bathurst which affords beautiful crystals of the grey oxide has been abandoned on account of the irregularity and unreliable character of the deposit. Operations, however, are still carried on at Sussex and Shepody. Of the precious metals, silver has been detected in some of the lead ores, in the ore of antimony near Pokiok, and in the copper ore of Simpson's Island, but only in minute quantities. Gold, so far as we are aware, is yet undiscovered; at least, there is no tangible evidence to show us that it has been found in the Province. If reliance may be placed on the results of the geological survey, the northern metamorphic band, the County of Charlotte, the region about the headquarters of the Tobique, and that part of the southern band which has not been shown to be of Devonian age, are the most promising districts for the gold seeker. The discovery of a rich gold field would undoubtedly give a great spur to the development of our Provincial resources, but, at the same time, would probably have a tendency to attract a lawless and reckless population. Seams of coal have been found at numerous localities within the great central area, covered by deposits of Carboniferous age. Few of these, however, promise to be productive. The unique variety found at Hillsborough has proved to be a mine of wealth to its owners. Operations have also been successfully carried on at the mines on Grand Lake for many years. But in no other part of the Province have beds of this mineral sufficiently large to attract the attention of capitalists, been opened. Those best qualified to judge (Drs. Robb and Dawson) of the productiveness of New Brunswick coal measures, gives us little reason to hope that they will yield stores of fossil fuel as large as, considering the extensive area which they cover, we might anticipate. Still the discovery of extensive beds is not altogether hopeless, for we should bear in mind that a great part of the area underlaid by these rocks remains unsettled and uncleared; and we may traverse parts of it for scores of miles through an unbroken wilderness. Although New Brunswick is not favored with the possession of mineral attractions so brilliant as some of her Colonial sisters, she is not altogether devoid of some solid advantages as the preceding summary will show. The many openings for the advantageous investment of capital, which are to be found in a young and flourishing colony is no doubt the reason why the abundant mineral wealth, with which bountiful Providence has endowed us, still remains undeveloped. As population increases, however, and our wants become more diversified, this source of a prosperous and remunerative commerce will receive the attention which it deserves. Already we see signs of the approach of such a period in the careful investigation which several newly discovered metallic deposits are receiving. [In these remarks I have endeavored as far as possible to occupy ground different from that taken up by Prof. L.W. Bailey in this valuable little publication on the mineral resources of the Province, as exemplified by the metallurgical collection of the University of New Brunswick; considering that a repetition of what has recently been made public would be superfluous.] Addenda. -Iron Ore of West Beach. - The bed of ore at this place inwhich the mine has been opened is included in the upper part of a large mass of coarse reddish-grey conglomerate, dipping to the S.E. at an angle of about 30ø, and distant a furlong from the shore. The pit or quarry from which the ore has been extracted has been opened in a bed of dark, reddish, brown hematite. One or more schooner loads have been taken away, and a quantity still remains awaiting shipment. The conglomerate is abundantly seamed with quartz containing scattered masses and veins of micaceous and specular iron in tabular crystals. Two or three miles eastward of the mine the iron ore again appears on the hill side. Here, however, three or four beds of ore (one of them 20 feet thick) are visible; and the associated rocks are different, consisting of beds of trap-ash, trap-ash slate, and talcomicaceous slate. The ore beds were not traced on the eastern side of Black River. Were it not for their variable thickness they might be sought for here with much probability of success. The 4 southern, of which the intermediate band passing through King's County is a subordinate spar, skirts the Bay of Fundy on its northern side as far as Chignecto Bay. A metamorphic district, of which little, however, is known, also exists about the head waters of the Tobique, Upsalquitch and Nepisiguit Rivers. The triangular area intervening between the two bands of altered and igneous rocks is occupied by an extensive coal formation, having deposits of Limestone and Gypsum, principally in the lower beds of the basin. On the triangular side of the first mentioned metamorphic band is another large and comparatively level district in which calcareous and argillaceous shales, of Silurian age, prevail. No great variety of minerals has been found in either of these flat districts, nor is it to be anticipated that there will be. Those, however, which do occur, are mostly of economic value (ores of iron, coal, gypsum, &c.) To the metamorphic bands and the district in which they unite therefore, we may look for the principal and more varied accessions to our mineral wealth. The following remarks regarding the southern metamorphic district are based upon the writer's own observations.The limestones of St. John Co. to which the localities in Portland pertain may have been produced by chemical deposition; for, although, they are only partially altered in many places, no fossils, except obscure vegetable remains have been detected in them. From the abundance of magnesian silicates we might suppose that these calcareous beds are, in part, ""dolomite."" The granite and gneiss of the limestone district contain tourmaline, epidote and laumontite, and small quantities of the sulphurets of iron, copper and lead, besides their ordinary constituents. Epidote is eminently characteristic of the trappean beds of Upper Devonian age, which extend in a double curve from Musquash to Bloomsbury Mt., and probably beyond. It is usually accompanied by quartz, specular iron and chlorite. Sheldon's Point is in this belt, and the minerals of Kingston and Clifton occur in stratified greenstone, probably of the same age; while those of Cape Spencer, West Beach and Black River are in overlying beds of sedimentary origin, largely charged with volcanic products. It will be seen that none of the zeolites found in the Triassic traps of Nova Scotia have yet been detected in the Devonian beds of volcanic origin on the North Shore of the Bay of Fundy; these latter seeming to hold (with the exception of chlorite and prehnite) anhydrous silicates only. The N.S. zeolites have been met with at only one locality in the Province - the Island of Grand Manan. It is not improbable, 5 therefore, that the trap of this island, like that of Isle au Haut and the North Shore of the Basin of Minas, is an outlier of the great masses which skirt the southern shore of the Bay of Fundy. Mineral Localities. - (This list was prepared three years ago for a supplement to Dana's Mineralogy which was not issued owing to the illness of the author of that work. I therefore feel that I am now at liberty to place it at your disposal. Alterations in the arrangement of some localities have been made, a few unimportant ones struck out, and others added. The marks used to distinguish the character of the specimens are similar to those in Dana's Mineralogy, viz: those which may be had in good specimens are underlined, (!) is added where they are remarkably good, (!!) where the specimens are unique. (NOTE - underlined articles are bracketed with square brackets, i.e. [coal] Albert County Grindstone Point and Island - Lignite, Iron Pyrites, Barytes. Hopewell - Gypsum, Selenite, [Alabaster].Albert Mines - Albertite !! Pollet River, 15 miles up - Coal. Shepody Mt. - Pyrolusite, [Calc spar], (rhombs with Manganese), Iron Pyrites, Native Alum, a clay. Turtle Creek - Coal. Carleton CountyWoodstock - Copper Pyrites, (mined) Wad, Bog Iron Ore. At Iron Mines - Hematite, Limonite. Charlotte County Beaver Harbour - Red jasper, Chlorite. Campobello island; at Welshpool - Iron Pyrites, Galena, Blende, Erubescite, Copper Pyrites. At head of Harbor de Lute - Galena, 4 in. vein. At Head Harbor - Iron Pyrites, Copperas. Deer Island, on N.W. side - Magnetic Iron, Calc Spar, (in Amygdaloidal) Hornstone, Quartz, (in trap). Digdeguash R., at Hog Island - Red jasper. On W. side of entrance - Calc Spar, (rhombs, in conglomerate,) Chalcedony, (in Greenstone,) At Rolling Dam - Graphite. Grand Manan

Island, between Northern Head and Dark Harbour - Amethyst, Agate, Jasper, Hornstone. [Thompsonite, Stilbite, Heulandite, Calc Spar, Zeolite (Mesotype?), Apophyllite], Specular Iron, Magnetic Iron. At Whale Cove - Calc spar ! Heulandite ! Laumontite ! Stilbite ! Semiopal ! At Fish Head (2 miles S. of Eel Brook) - Chlorite, (abundant in qtz). At Ross's Island - Quartz Crystals. White Head - Chlorite, Quartz Crystals. At Kent's Island - Veined Marble. L'Etang Island and Harbour - Marble, Serpentine, Chlorite, Iron Pyrites. Le Tete - Galena, Erubescite, Copper Pyrites, Barytes. 6 Magaguadavic R., at entrance - Veins of copper pyrites, Malachite, Azurite. One eighth of a mile E. - Galena. Red Head, (on Mace's Bay) - Red jasper. Seeley's Cove, Hill 1/2 mile N. of - Quartz crystals, Calc spar, Magnetic Iron, Iron Pyrites. St. Stephen, 4 1/2 miles N. of - Graphite (in greywacke). Molybdenite, (in gneiss.) Milltown - Pyrites. Simpson's Island, on the Shore - Copper glance, Malachite. [See note]. Waweig R., 3 miles up, at Cormick's Mills, - Pyrites, Feldspar, Schorl and Garnet, (in boulder). At Bartlett's Pond - Quartz crystals. At Oak Bay - Hepatic Pyrites, in greywacke.) Gloucester County Bathurst - Malachite, (in coal). Eight miles from, on Tete-a-gouche R. - Manganite, (in crystals and crystalline,) [Copper Pyrites]. Kent County Buctouche R. - Coal. Cocaigne R., on branch, 3 miles from bridge - Coal. Richibucto R., 3 miles above Ford's Mills and at Big Brook - Coal. At Bass R. - Iron pyrites. Half mile W. of Liverpool - Bog Iron Ore. Kouchibouguaasis R. - Coal. Kings County Belleisle Bay, on N. Shore - Galena, (in limestone), veins of chalcedony, Jasper and Hornstone, (in trap). One and a half miles W. of Bull Moose Hill, on farms of Northrup and Benson - Large bed of Magnetic Iron. Clifton - [Orthoclase], (xls) Epidote, [(Pistacite)]. (common xls.) [Chlorite], (abundant granular,) Prehnite, all in bedded greenstone, Quartz crystals, Specular Iron. Hammond R., at Sherwood's - Graphite, (in limestone). Hampton, and at Darling's Lake, in loose pieces - Agate, Carnelian, Red jasper. Kingston, on ridge S. of village - Magnetic Iron, Magnetic Pyrites; also, Chlorite and Red jasper. Nerepis, near Hatfield's Mill - Iron Pyrites, (in greywacke). Near Mather's Inn - Amethyst, Quartz Crystals, Feldspar. Norton - Near Choat's Mill, on road to Belleisle - Argentif. Galena. One mile N. of Baxter's Inn - Specular Iron (xls) and Red Hematite. Quispamsis - Pyrites, Copper pyrites, Galena, Laumontite. Sussex, 1/4 mile from church, on McReady's farm - 7 [Selenite !] (hexagonal xls. forming in the mud of a spring.) [There are two fine groups of crystals from this locality in the Museum of the Mechanics' Institute.] Eight miles from Station, on Dutch Valley road - [Manganite], Pyrolusite, [Barytes.] Upham - Brine springs.Four miles E. of Titus Mill - Gypsum Northumberland County Boiestown - Coal. Barnaby's R., opposite mouth - Coal. Chatham - Coal, Iron Pyrites. Newcastle - Coal. Queens County Grand Lake, at Grand Point - Fossil Trees, containing Barytes, Pyrites, Copperas. Salmon River, (on Crawford's farm) - Coal, Caly, Iron Stone, Pyrites, Copperas. Newcastle - Coal mines. Coal Creek - Coal, (formerly mined.) Long Reach, opposite VanWart's - Chlorite. Washademoak River - Coal, (2 1/2 miles from Long's Creek.) Few miles above mouth on S.E. of a small cove - Hornstone, Jasper, Chalcedony, Carnelian, Quartz Crystals. Restigouche County Belledune Point - Verd Antique, Serpentine, Iceland Spar! Dalhousie, near to - [Agate], Carnelian. Point le Nim - Coal. St. John County Carleton, near Falls - Red Calcite. Chance Harbour - [Calc spar] (deep red xls) in quartz veins, Chlorite (in argill and talcose state). Brandy Brook - Quartz crystals. - Epidote (Pistacite) and Hornblende in boulders. Black R. settlement. - [Quartz crystals], Chlorite, Calc spar, Copper Pyrites, Specular Iron !(tabl. xls) Little Dipper Harbour, on W. side - Barytes, quartz crystals, Amethyst (in compact greenstone). Moosepath - Schorl (crystals), Hornblende (crystals), Felspar (red), Muscovite, Albite (?) Musquash, on E. side, Harb. at entrance - Graphite, Pyrites, Copperas. At Shannon's - Serpentine, Verd-Antique, [Chrysotile.] E. side of Musquash - [Quartz crystals] (veins in conglomerate). Portland, [Crow's Nest - Serpentine,] Chrysotile, Steatite, Magnesite, Asbestos. [Drury's Cove] - Indurated Talc, Pyrallolite (?), Graphite, Pyrites.[At the Falls] - Graphite (impure bed 4 ft.) [Fort Howe Hill] - Graphite, Calcite (several forms, viz: dogs-tooth spar, nail-head spar, &c.) [Howe's Road], 1 1/2 miles from St. John - Epidote (in syenite). ! 1/2 mile from road [Tremolite], Steatite, Mica (?). [Lily Lake] - Serpentine, Chrysotile, Talc, (radiated), Steatite, Graphite. [White Augite] (?). Quaco, Light House Pt. - Manganese, ([Pyrolusite]), (bed 4 ft). W. of Point - Lignite. E. of Quaco, Fuller's Creek - Graphite, Iron Pyrites. Farther Eastward - Schorl, Asbestos, Chrysotile, Serpentine. Sheldon's Pt. - [Epidote] (Pistacite and Zoisite), Actinolite, Asbestos, Calcite, Specular Iron, Malachite. Cape Spencer - Specular Iron (crystals), Calcite (crystals), Talc, Chlorite, Asbestos. Ten Mile Creek - Coal in slate and sandstone. West Beach - At Evan's - Quartz Crystals, Talc, Chlorite. Half Mile W. of Evan's - Vein of Magnesite with Talc, Chlorite and Magnetic Iron, Copper and Iron Pyrites, [Hematite], [Specular Iron]. [See note.] Point Wolf and Salmon R. - Iron and [Copper] [Pyrites], Asbestos, Chlorite, [Erubescite], Chrysocolla, [Cuprite.] Sunbury County Oromocto River, N. Branch, 10 miles up - Coal. Lincoln - Wad, Bog Iron Ore. Victoria County Tobique River - Red Jasper, Carnelian, Agate. At mouth, S. side - Galena. At mouth of Wapskehegan R. - Gypsum, Salt Springs. Three miles farther up - Stalactites (abundant). Quisibis River - [Blue Phosphate of Iron] (in clay). Westmorland County Bellevue - Iron Pyrites. Dorchester, Taylor's Farm - Cannel Coal, Clay Iron Stone. On Ayre's Farm - Petroleum, Asphaltum. Grand Anse - Gypsum, [Selenite] (large crystals), Apatite, (vide Gesner). Memramcook - Coal, [(Albertite).] Shediac - 4 miles up Scadouc R. - Coal. York County Harvey Settlement - Wad. Nashwaak River - Coal. Tay Creek - Coal. Pokiok River - Tin pyrites (in granite vein). Three miles from St. John River, in direction of Lake George - Stibnite ! [See note]. 9 In order to obtain a clearer view of the value of the mineralogical resources of the Province as thus far developed, let us take a glance at the more important facts to be deduced from the foregoing list. Many of the minerals noted in its columns are not of economic importance, and therefore will not receive any further notice. Serpentine and marble, both of which are largely used in ornamental work, are known to occur at many localities; but few of those which have been examined yield blocks sufficiently perfect to be useful to the manufacturer. Of such well known and widely distributed minerals as limestone and gypsum it is scarcely necessary to speak. Both, the former especially, are abundant in many parts of the Province. Heavy beds of limestone are common in the southern metamorphic belt, also on the Bay Chaleur. Unaltered deposits may be seen skirting the margin of the great coal field. Gypsum is confined mostly to the Lower Carboniferous series of King's, Albert, and Westmorland; but occurs also in the red sandstone district of the Tobique River. Chlorite or ""pipestone"" and Steatite or ""soapstone"" have been found at a number of places; but no deposit of the latter mineral, sufficiently large to be available for manufacturing purposes, has yet been discovered. Barytes, or ""heavy spar,"" has been met with only at a few localities, and not in any considerable quantity, unless we may except that in Sussex and a large deposit said to occur at Le Tete. This mineral is largely used in the manufacture of white paint, and also for other purposes. It resembles calcareous spar, but differs in cleavage and is much heavier. The only gem which this province has thus far yielded is that very common one called, according to its color, white stone or rock crystal, false topaz, and amethyst. Other varieties of this mineral, such as carnelian, agate and jasper, which are frequently used in jewellery, occur at several places. Garnet is reported from Waweig river, but it has not been found ""in situ"". All the tourmalines mentioned are of the ordinary black variety. It will be seen on examination of the catalogue, that all the metals in ordinary use as well as some others which are more infrequent, occur in this province. But of the commoner ones several have not been found in sufficient quantity to be worth extracting. Indications of tin were observed in the granite of the Pokiok river, by Dr. Gesner. Lead ore has been met with at Tobique River, Norton, Campo Bello, and other places, but not in sufficient quantities as to assure a profitable return to 10 the miner. Zinc blende is found at Campo Bello and a few other localities, but not even so abundantly as lead. This mineral is usually of a dark brown color, and is frequently associated, as at Campo Bello, with galena and copper pyrites. Several ores of copper, chiefly sulphurets and carbonates occur in various parts of the Province, but few of the mines opened in these deposits have been permanently worked. Those of Bathurst and Woodstock have been abandoned. But mining on a small scale is still continued at Salmon River and Le Tete, and experimental operations on the deposit at Simpson's Island have been commenced. Two ores of this metal have been newly added to the list of those already known to occur in the Province. These are the Suplhuret called copper glance, from Simpson's Island and cuprite, or the red oxide of copper found at Salmon River. Iron and manganese are the metals which above all others are most abundant. Heavy ore beds of the former are exposed at Woodstock, Nerepis Road, Bull Moose Hill, West Beach, and other localities referred to in the list. At the first mentioned place the ore has been worked for a number of years. Manganese occurs in greatest quantities and purity near the eastern terminations of the two metamorphic bands to which allusion has already been made. The earthy variety called Wad is also common. The mine near Bathurst which affords beautiful crystals of the grey oxide has been abandoned on account of the irregularity and unreliable character of the deposit. Operations, however, are still carried on at Sussex and Shepody. Of the precious metals, silver has been detected in some of the lead ores, in the ore of antimony near Pokiok, and in the copper ore of Simpson's Island, but only in minute quantities. Gold, so far as we are aware, is yet undiscovered; at least, there is no tangible evidence to show us that it has been found in the Province. If reliance may be placed on the results of the geological survey, the northern metamorphic band, the County of Charlotte, the region about the headquarters of the Tobique, and that part of the southern band which has not been shown to be of Devonian age, are the most promising districts for the gold seeker. The discovery of a rich gold field would undoubtedly give a great spur to the development of our Provincial resources, but, at the same time, would probably have a tendency to attract a lawless and reckless population. Seams of coal have been found at numerous localities within the great central area, covered by deposits of Carboniferous age. Few of these, however, promise to be productive. The unique variety found at Hillsborough has proved to be a mine of wealth to its owners. Operations have also been successfully carried on at the mines on Grand Lake for many years. But in no other part of the Province have beds of this mineral sufficiently large to attract the attention of capitalists, been opened. Those best qualified to judge (Drs. Robb and Dawson) of the productiveness of New Brunswick coal measures, gives us little reason to hope that they will yield stores of fossil fuel as large as, considering the extensive area which they cover, we might anticipate. Still the discovery of extensive beds is not altogether hopeless, for we should bear in mind that a great part of the area underlaid by these rocks remains unsettled and uncleared; and we may traverse parts of it for scores of miles through an unbroken wilderness. Although New Brunswick is not favored with the possession of mineral attractions so brilliant as some of her Colonial sisters, she is not altogether devoid of some solid advantages as the preceding summary will show. The many openings for the advantageous investment of capital, which are to be found in a young and flourishing colony is no doubt the reason why the abundant mineral wealth, with which bountiful Providence has endowed us, still remains undeveloped. As population increases, however, and our wants become more diversified, this source of a prosperous and remunerative commerce will receive the attention which it deserves. Already we see signs of the approach of such a period in the careful investigation which several newly discovered metallic deposits are receiving. [In these remarks I have endeavored as far as possible to occupy ground different from that taken up by Prof. L.W. Bailey in this valuable little publication on the mineral resources of the Province, as exemplified by the metallurgical collection of the University of New Brunswick; considering that a repetition of what has recently been made public would be superfluous.] Addenda. -Iron Ore of West Beach. - The bed of ore at this place inwhich the mine has been opened is included in the upper part of a large mass of coarse reddish-grey conglomerate, dipping to the S.E. at an angle of about 30ø, and distant a furlong from the shore. The pit or quarry from which the ore has been extracted has been opened in a bed of dark, reddish, brown hematite. One or more schooner loads have been taken away, and a quantity still remains awaiting shipment. The conglomerate is abundantly seamed with quartz containing scattered masses and veins of micaceous and specular iron in tabular crystals. Two or three miles eastward of the mine the iron ore again appears on the hill side. Here, however, three or four beds of ore (one of them 20 feet thick) are visible; and the associated rocks are different, consisting of beds of trap-ash, trap-ash slate, and talcomicaceous slate. The ore beds were not traced on the eastern side of Black River. Were it not for their variable thickness they might be sought for here with much probability of success. A continuation of the same rocks holds beds of limestone at Emerson's Creek, a few miles to the eastward.

The facilities for working this ore are therefore, in some respects, unusually good, but no smelting operations have hitherto been undertaken. From its association it would appear that this ore was originally deposited in the state of a finely divided ferruginous mud, in a shallow sea and within the influence of active volcanoes. I hope to be able to show at some future time that the accompanying rocks do not possess the antiquity ascribed to them in the geological reports of Dr. Gesner, but are of a later date than the sandstones and shales of St. John, which have yielded such an abundant harvest of Devonian plants. [For the information regarding the two following localities, I am indebted to Edward Allison, Esq.] Copper Ore, Simpson's Island. -The vein of green carbonate (malachite) recently discovered, occurs in a small island, (not exceeding 100 acres in extent) about one mile south of Deer Island, andseven miles from Eastport. The island is composed of trap-rock, through which protrudes a band of slate, with nearly vertical layers, which extends across the island in an East and West direction; it being about four feet wide on the West side, and from ten to twelve feet wide where it terminates in a small cove on the East side of the Island. The copper lode occurs in this slate, and was discovered on the West side of the Island in a beach which extends (from high to low water) abut 400 feet. This beach is composed of rock covered with seaweed, except near high water mark, where it is shingle. The copper lode, where discovered, is about four feet wide, and about 150 feet from low water mark; it has been traced about 150 feet toward the shore and to low water mark. Several tons of this ore have been taken out and sent to Liverpool to be tested. A small sample sent some time since yielded 27 per cent of copper, and nearly four ounces of silver to the ton. The value of the ore as taken out is reported to be £27 stg. per ton. [Pieces of Copper glance (sulphuret of copper) were scattered through the Carbonate which forms the mass of the ore at the surface, and were found to increase when the evacuation was deepened. At a greater depth the ore probably consists of the former compound, as the carbonate seems to result entirely from decomposing agencies at work at and near the surface] - G.F.M. Antimony of York Co. -The vein of antimony recently discovered occurs in York Co., Parish of Prince William, about 20 miles above Fredericton, and is on the S.W. side of the river Saint John. The rise of the land from the river at this place is gradual, till the summit of the slope (about 300 feet high) is reached, when the ground falls away toward Lake George, and the Pokiok Stream. Near the top of the slope a band of primary rock, having a course about N.W. and S.E., protrudes through the soil, and is shown particularly where it crosses the highway. This band of rock contains the vein of antimony referred to. It was discovered in boulders evidently detached from this ridge, and upon uncovering the rock the antimony was discovered imbedded in it. The vein was traced about one quarter of a mile by trial pits, and probably extends further. It appears to be about two feet wide, with a dip to the North of about 45ø. The vein has not been penetrated to a depth of more than six feet. Samples of the ore have been analyzed by Drs. Hayes and Jackson of Boston - also by a person in Liverpool. The result differs

N.B. Courier - Jul. 28, 1838 Geological Survey. - We omitted to mention in a former number, that Dr. Gesner had re commenced his Geological Survey of the Province; having proceeded to Charlotte County for that purpose. We understand that Gentleman will not publish any account of his proceedings, until he has finally made his Report in the Autumn; but we have reason to believe that hisdiscoveries in that quarter are of a highly interestingnature; and that he has examined the Saint Croix from itssource to some distance above Saint Stephen's and the country in that neighborhood, together with the Islands in Passamaquoddy Bay which belong to the British, with the exception of Grand Manan; where valuable Lime andGranite quarries and Mineral Springs have been found. Lead Ore has been obtained on Campobello; and there is anabundance of Marl, which is valuable to the farmers in that quarter, and remarkable tertiary deposits containing numerous fossil shells. These features of the country in a geological point of view are new and interesting; and the inhabitants of this Province generally, may promise themselves much advantage from Dr. Gesner's

Daily News - Aug. 7, 1879 and Chignecto Post - Aug. 7, 1879 Albert Items. - The parish of Alma promises to be a busy place. It has long been known that rich deposits of copper existed in several places, and some of these were worked to advantage some time ago. A gentleman connected with the Newfoundland copper works has been here lately, leased the McKinley property, and proposes to put a large number of men to work at once. Another party are prospecting up the brook, and the outlook for Alma is quite cheery. Harvey has its mine of anthracite and stonequarries .... Mr. McHenry's patient efforts in the developmentof the resources of Albert is being rewarded, and the parish of Hillsboro rejoices in rich deposits of brick and pottery clay, lime, etc."

Codes: 0646 / 0645 / 0721 / 0639 / 2035 / O3 / Z2 / HILL / LIME / GYP / A9 / J8 / A2 / IDX_Names: Albert Manganese; Waterside Manganese; Shepody Mountain Manganese; Dickson Brook; Harvey Manganese; Hopewell Gypsum; Sandstone, Building Stone, Monument Stone, etc.; Grey Brook Gypsum; Lime - General; Gypsum; Albert County Mercury; Albert Mines; Albert / Kings County Oil Shales;
Daily Telegraph - Aug. 7, 1880 Albert County. - ... Mineral Deposits. - Albert affords a fine field for the geological explorer, and the justly celebrated Hugh Miller would have found, here, many Schools and Schoolmasters to excite interest and stimulate his favorite study. Accepted theories might, however, be more disturbed than strengthened by a critical examination of the characteristics of this district. A considerable belt of metalliferous rock,follows the higher ranges from Shepody Mountain, westward to St. John County, and contains more or less of gold, copper, tin, iron and telluride - quicksilver has lately been discovered, the locality known only to a few, andasbestos is reported near the western line, a short wayfrom the Bay shore. Alma is the parish richest in metals so far as known, and the copper beds there have exchanged owners at high rates, though little has yet been done in working. Pockets of manganese may be seen at Waterside and Germantown in Harvey and in Hopewell, where theMessrs. Steadman expended $60,000 in erecting works for manufacturing chemical products from local deposits. Lime rock is plentiful in Elgin, Harvey, Hillsborough and Hopewell, and in the last named parish, a company is engaged in its burning and preparation for market. Marble exists in several places, but has not yet attracted the attention of capitalists.Very fine freestone is found all along the shore of the bay and on the Petitcodiac. Two quarries at St. Mary's and one at Curryville on the railway line are being worked at present. Gypsum of the best grade outcrops in many places.The rock is being exported from Hopewell, about 3,000 tons being now ready for shipment; and in Hillsborough the Albert Manufacturing Co., at present managed by Joseph T. Tompkins, Esq., has, since 1854, carried on a large business. The proposed capital was œ50,000, and, in this case, the objects of the original charter have been exceptionally well carried out, though always laboring under the disadvantage of the high tariff of the United States. The company has continuously afforded local work for a number of men at all seasons, and has greatly promoted the carrying trade. Railways have been built; a superior factory has been erected to replace the one burned; and, with the necessary equipment of wharves, stores, warehouses, etc., the company has added much to the appearance of the village. The excavating, road making, trucking, cooperage work, grinding, calcining, barrelling, shipping, etc., have for a number of years secured for Hillsborough a hum of which few villages can boast. The recent increase of 7 « per cent duty on imported calcined plaster has, perhaps, enabled the company to place larger quantities in the Canadian markets, whatever may have been the counteracting influences of the tariff regarding it in other directions. The Hillsborough Plaster and Railroad Company of 1851 has not continuously operated. Other valuable gypsum properties are held by Sir A.J. Smith and others. Of these James Blight, Esq., is local agent, and this gentleman, in fact, did a great deal of initiatory work in developing the business. Coal in limited seams may be seen in everyparish, mostly cannel of inferior quality, but the most important carboniferous deposit, yet discovered, lies in the interior of Hillsborough. This has long been called Albertite, and was first noticed, accidentally, by the Messrs. Duffy in 1848, was

obtained from the Crown in January, 1850, a mining licence over a mile square, and their rights were shortly purchased for œ3,000 by a company, of whom the late Edward Allison, Esq., was the chief promoter. A charter was granted in 1852, and the noted lawsuit ensued between Henry Gesner, Esq., a proprietor of the soil, vs. the Albertite Mining Co. Wilmot, J., the late Hon. J.M. Johnson and Hon. J.H. Gray, now a B.C. judge, were among the counsel employed. The trial lasted several weeks, and the twelve jurors, who were instructed to determine and report, what the substance was, must have found their first lessons in geology rather tedious while listening to words of learned length and thundering sound, employed in the testimony as given by several of the most celebrated scientific men of the Continent. The substance had the chemical properties of coal, but the geological formation differed from all recognized theories. It differed from the Trinidad asphaltum in luster and fracture. The savants were evidently puzzled; but the jury said it was coal. A later conclusion, however, made it consolidated oil, and it is now known under the name of Albertite. Between costly litigation and unskilful management the net earnings were small till, in the person of John Byers, Esq., the company secured the services of one, who combined practical knowledge with executive ability. In one year about 15,000 tons were shipped, worth $15 per ton on the wharf. Latterly the export is less, as the drifts are at great depth, and the facilities for cheap working are becoming more impaired. It is hoped that further searches may restore confidence in the extent of this valuable article. Albertite is also found in minute quantities in Midland and other parts of Elgin and in Hillsborough, and it is known to exist in Hopewell in considerable quantities, by an old discovery; when its value was unknown, which late searches have failed to recover. The Princess Alexandra, East Albert and Prince of Wales companies, of which Mr. Blight is manager, have each expended large sums in freehold leases and prospecting work, but excepting the finding of comparatively narrow veins of Albertite nothing has resulted beyond the very useful employment of labor in the locality. In Rosevale and other districts are found large quantities of oil shale or bituminous rock, containing about 45 to 50 gallons of refined oil per ton, besides a residuum of pitch or asphaltum, making the whole volatile matter over 60 gallons to the ton. The oil is very pure and exceedingly valuable for illuminating purposes. Mineral oil exudes from the soil on McLatchey's farm in Hillsboro, and at Hopewell Hill, but the coming millionaire, who will first strike a flowing fountain, is not yet known, either to himself or others."

Marble exists in several places, but has not yet attracted the attention of capitalists.Very fine freestone is found all along the shore of the bay and on the Petitcodiac. Two quarries at St. Mary's and one at Curryville on the railway line are being worked at present. Gypsum of the best grade outcrops in many places.The rock is being exported from Hopewell, about 3,000 tons being now ready for shipment; and in Hillsborough the Albert Manufacturing Co., at present managed by Joseph T. Tompkins, Esq., has, since 1854, carried on a large business. The proposed capital was œ50,000, and, in this case, the objects of the original charter have been exceptionally well carried out, though always laboring under the disadvantage of the high tariff of the United States. The company has continuously afforded local work for a number of men at all seasons, and has greatly promoted the carrying trade. Railways have been built; a superior factory has been erected to replace the one burned; and, with the necessary equipment of wharves, stores, warehouses, etc., the company has added much to the appearance of the village. The excavating, road making, trucking, cooperage work, grinding, calcining, barrelling, shipping, etc., have for a number of years secured for Hillsborough a hum of which few villages can boast. The recent increase of 7 « per cent duty on imported calcined plaster has, perhaps, enabled the company to place larger quantities in the Canadian markets, whatever may have been the counteracting influences of the tariff regarding it in other directions. The Hillsborough Plaster and Railroad Company of 1851 has not continuously operated. Other valuable gypsum properties are held by Sir A.J. Smith and others. Of these James Blight, Esq., is local agent, and this gentleman, in fact, did a great deal of initiatory work in developing the business. Coal in limited seams may be seen in everyparish, mostly cannel of inferior quality, but the most important carboniferous deposit, yet discovered, lies in the interior of Hillsborough. This has long been called Albertite, and was first noticed, accidentally, by the Messrs. Duffy in 1848, was obtained from the Crown in January, 1850, a mining licence over a mile square, and their rights were shortly purchased for œ3,000 by a company, of whom the late Edward Allison, Esq., was the chief promoter. A charter was granted in 1852, and the noted lawsuit ensued between Henry Gesner, Esq., a proprietor of the soil, vs. the Albertite Mining Co. Wilmot, J., the late Hon, J.M. Johnson and Hon. J.H. Gray, now a B.C. judge, were among the counsel employed. The trial lasted several weeks, and the twelve jurors, who were instructed to determine and report, what the substance was, must have found their first lessons in geology rather tedious while listening to words of learned length and thundering sound, employed in the testimony as given by several of the most celebrated scientific men of the Continent. The substance had the chemical properties of coal, but the geological formation differed from all recognized theories. It differed from the Trinidad asphaltum in luster and fracture. The savants were evidently puzzled; but the jury said it was coal. A later conclusion, however, made it consolidated oil, and it is now known under the name of Albertite. Between costly litigation and unskilful management the net earnings were small till, in the person of John Byers, Esq., the company secured the services of one, who combined practical knowledge with executive ability. In one year about 15,000 tons were shipped, worth $15 per ton on the wharf. Latterly the export is less, as the drifts are at great depth, and the facilities for cheap working are becoming more impaired. It is hoped that further searches may restore confidence in the extent of this valuable article. Albertite is also found in minute quantities in Midland and other parts of Elgin and in Hillsborough, and it is known to exist in Hopewell in considerable quantities, by an old discovery; when its value was unknown, which late searches have failed to recover. The Princess Alexandra, East Albert and Prince of Wales companies, of which Mr. Blight is manager, have each expended large sums in freehold leases and prospecting work, but excepting the finding of comparatively narrow veins of Albertite nothing has resulted beyond the very useful employment of labor in the locality. In Rosevale and other districts are found large quantities of oil shale or bituminous rock, containing about 45 to 50 gallons of refined oil per ton, besides a residuum of pitch or asphaltum, making the whole volatile matter over 60 gallons to the ton. The oil is very pure and exceedingly valuable for illuminating purposes. Mineral oil exudes from the soil on McLatchey's farm in Hillsboro, and at Hopewell Hill, but the coming millionaire, who will first strike a flowing fountain, is not yet known, either to himself or others."

Daily Telegraph - Aug. 7, 1880 The Gold Areas in New Brunswick. - Mr. Edward Gilpin, inspector of mines for Nova Scotia, has published a book on the Mines of Nova Scotia, already noticed in the Telegraph, in which, at several places, he alludes to the mineral wealth of New Brunswick. Among other things which the book contains is a history and description of the gold mines of Nova Scotia; and the author advocates the prosecution of the survey of that Province at the joint expense of the Dominion and Provincial Governments. Mr. Gilpin does not seem to make any allusion to the discovery of gold in New Brunswick, and it may be well to say something about the localities where the precious metal has been met with in this Province. Gold is not very uncommon in certain metamorphic or altered rocks, such as slates and quartzites; but, while not unfrequently present in such rocks, it is usually found in such minute quantities that the cost of extraction swallows up the value of the product. When this is not the case, and the gold occurs in greater abundance, there is a chance for mining it with profit. As Quebec, to the north of New Brunswick and Nova Scotia to the south, both have their gold mines, it is not unreasonable to look for gold in the similar rocks of New Brunswick. There are parts of the province where such a search would probably be undertaken in vain. Those unpromising regions are the following: 1st. The large area (about one quarter of the province) occupied by the coal measures. This area may be roughly described as a triangle having its base on the Gulf of St. Lawrence, and its apex at Oromocto Lake in York County. Then there is another large tract where the rocks are those of the lower carboniferous series, mostly red sandstone and shale. This also may be regarded as barren of gold. Finally, there are several large areas of intrusive granite and hard trap rocks in which gold hardly need bt looked for. The most promising parts of the province for gold prospecting are the belts of metamorphic slates found on both sides of the great triangular area of coal measures. The discovery of gold in these rocks has been announced on several occasions, and in some cases the discovery has been verified. Prof. H.Y. Hind, who was employed to make a survey of the northern part of New Brunswick, reported the presence of gold in small quantities in several of the streams flowing from the highlands of that region. Afterward Mr. Charles Robb was sent down by the Geological Survey of Canada to investigate this region and appears to confirm the discovery of gold on the Serpentine, a branch of theTobique. He does not, however, speak very hopefully of the result obtained up to the time of his visit, for he says: It would require the expenditure of a larger amount of capital than has hither to been applied, in order to establish the profitably auriferous character of the region. Gold, it is asserted, was found on the Muniac stream last year, and it has this year been reported from streams further south in Carleton County. On the south side of the coal measures gold has been found in the vicinity of St. Stephen as described by Prof. L.W. Bailey's report on the mines and minerals of New Brunswick, and it was discovered in the analysis of ores from the Le Tete peninsula, and was found by Dr.A.A. Hayes, of Boston, in samples sent from near Randall's quarry and Lime Kiln at L'Etang. These localities are in Charlotte county, but there is another further east, namely the Vernon mine in Albert county, in the ores of which, according to the report cited, Dr. Hayes discovered gold to the value of $22 to the ton. That more frequent and valuable discoveries of gold have not been made in New Brunswick need not be thought surprising when it is considered that by far the greater part of the country is forest clad, and elsewhere the ledges are mostly concealed by earth. There is but a short coast-line in the districts where gold may be expected to be found, and in this respect the advantages for discovering are much less than in Nova Scotia. There are so many indications of the existence of gold in New Brunswick that it is quite probable that remunerative deposits may yet be found, and gold mining be established as one of the regular industries of the Province. The remunerative character of gold mining in Nova Scotia, as recently reported, may stimulate search for the

St. Croix Courier - Mar. 31, 1892 Minerals of New Brunswick. - Extracts from a Paper by Prof. L.W. Bailey, of the Geological Survey of Canada. - From a paper by Prof L.W. Bailey, written for the Canadian Mining and Mechanical Review and published in the Crown Land Report, we take the following extracts concerning minerals in Charlotte county:- New Brunswick has, as yet, certainly established no claim to prominence as a mineral producing country. This is the more remarkable as within her borders are not only to be found those geological formations which elsewhere are usually the seat of valuable ore deposits but these occupy extensive areas, and present features in the way of plication, metamorphism, granitic and igneous intrusions, which would greatly enhance the probability of occurrence of such deposits. It is, however, to be remembered that very large portions of the province, and particularly those which might be expected to be metalliferous, are still densely forest clad, and that while the limits and age of the different rock formations have been worked out and mapped with a considerable degree of accuracy by the officers of the Geological Survey, but little has yet been done in the way of intelligent and systematic prospecting. ANTHRACITE. - This mineral is found to be limitedin extent in the Devonian rocks in St. John county. In many instances it is evidently the result of alteration, wholly or in part, of the individual trunks of fossil trees scattered throughout the sandstones of the Devonian formation; but in a few cases the vegetable accumulations would seem to have been such as to give rise to actual beds of coal, though of no great thickness. The best known locality for these beds is that of Lepreaux basin, near the western border of St. John county, and not far from the mouth of the Lepreaux river. A seam of mixed coal and shale is here met with, having a total thickness of fifteen feet; but the shale is irregularly distributed through the coal, and the latter, where purest, does not exceed a thickness of four feet, while it also contains much earthy matter. Analyses of samples from the outcrop, made by Dr. Harrington, gave 36.38 per cent of ash. The beds at this locality are all highly disturbed, and the area over which they are distributed is but small. MOLYBDENITE. - Molybdenum sulphide, or molybdenite has been observed at several localities, but chiefly in connection with the gneissic and micaceous strata, which border the great central granitic axis of the province, or in the granite itself. It has been thusfound near St. Stephen in Charlotte County, near thegranite belt in York county, and below the Pabineau Fallson the Nepisiguit river in Gloucester county. At the second of these localities it appears to be quite abundant. GRAPHITE. - Graphite or plumbago, in a finelydivided state, is not unfrequently disseminated through the altered rocks of the older formations to which it imparts a dark color and more or less glossy aspect. It is most abundant with the pre-Cambrian rocks which are believed to represent the Laurentian system in St. John county. Much of the limestone of this formation is dark grey or even black from this cause, while in places the graphite assumes the form of veins, pockets or well defined beds. A band of this character crosses the mouth of the St. John river at the falls, and is traceable both east and west for several miles. Mining operations for its removal have been frequently undertaken, and at one time (1868-1870) about 6000 barrels per year, averaging when crushed and screened about 4 cwt. to the barrel, were removed. The beds vary in thickness from one to four feet. The mineral itself is somewhat impure and incapable of being directly applied to the uses for which the finer qualities of graphite are employed, but has been found to answer well for foundry facings, stove polishes and the like, and by appropriate treatment can be rendered available for other purposes as well. Quite recently these mines have been reopened. Of other formations containing considerable quantities of graphite may be mentioned the Cambro-Silurian and the Devonian. The slates and schists of the former, as found near St. Stephen and elsewhere in Charlotte county and in the parish of Canterbury, York county, are often highly plumbaginous, but neither in these nor in the Devonian are there any known deposits of economic value. GOLD. - The amount of positive information regarding the presence of this metal in New Brunswick at present possessed is very small. Reports of its discovery have indeed been frequent, but in the very few instances in which these appear to have eminated from reliable sources the amount of gold observed has been so small as to discourage further efforts to obtain it. While, however, the amount of the metal actually obtained is thus insignificant, it is worth while to notice that rocks very nearly resembling those of the auriferous belt of Nova Scotia, and believed to be of the same age, are largely developed there, and further, that it is in connection with these same rocks that very many of the reported discoveries of gold have been made. The rocks referred to are those comprising the slate and quartzite belts which border the great central granitic axis of York and Northumberland counties, and which with the latter traverse the entire breadth of the province. Much of this region is still densely forest clad and difficult of access, but should any portion of it prove to be auriferous the discovery would be of inestimable value to the province, as helping to open up an extensive region otherwise likely to remain permanently in a wilderness condition. Among the points in which gold has been reported in small quantities may be mentioned the vicinity of the St. Croix river in Charlotte county, theNashwaak river above Stanley, in York county, the Muniacriver, in Carleton county, and the Serpentine river, inVictoria county. (to be

S.J. Daily Sun - Jul. 15, 1881 [and similar version in Daily Telegraph - Jul. 15, 1881] Educational Institute. - Addresses by ... Mr. G.F. Matthew ... - Useful Minerals of New Brunswick. - ... Prof. Burwash, of Sackville, was received as an honorary member on the floor of the Institute... New Brunswick's Useful Minerals. - Dr. Rand then introduced G.F. Matthew, Esq., A.M., who delivered an interesting address on Useful Minerals of New Brunswick. Mr. Matthew said the first Europeans who settled in Acadia found themselves in a country abounding with game and fish and almost too well wooded. As the lumber resources were diminished the people were led to turn their attention to the products of the mine. The increase of manufactures in our midst will no doubt causea greater demand for our minerals and greater knowledgeof them will be of value. He would first give a sketch of the useful minerals of New Brunswick. In describing theuseful minerals he did not purpose to confine himself to the simple minerals, but to describe as well the variouscompound and impure substances of mineral origin, orcomposition, which are available for economical purposes.In this connexion various earthy deposits and rocks whichhave an homogenous structure will be noticed. There are anumber of these mineral species, which from theiroccurrence in large masses, or as being more valuable than others, are worthy of a place among the economical minerals; and among these the ores of metals hold a prominent place. Our knowledge of metals has grown up of late years, our ancestors knowing nothing of them. The occurrence of these metals in New Brunswick would be still unknown were it not for the researches which have given to modern chemistry the power to analyze and pick them out from their combinations. Prominent among the metals of vital importance to the community is iron. Ores of this metal are known to exist at several localities in New Brunswick but only those of Woodstock have been largely mined and smelted. The Woodstock ore is chiefly of the hematite species, and extends from Aroostook County in Maine to and across the St. John River into Peel parish of Carleton County. About 40,000 tons are said to be smelted in Woodstock Iron Works. Some of the iron ore beds of this district contain a large percentage of manganese. Similar manganese iron ores are found at Markhamville, King's County, and at West Beach, St. John County. A kind of iron ore which is a secondary product, resulting from the decomposition of other iron ores, is called bog iron. This ore is found in thick beds, especially in the carboniferous districts of York, Queens and Sunbury. Magnetic or black oxide of iron is a third ore of this metal, while a fourth one is thecarbonate. Beds of this latter ore have been found in the coal measures of Queens County and elsewhere. The fifth ore, which occurs in many places but usually in small quantities, is the sulphuret of iron. At Moore's Mills, Charlotte County, it is quite extensively found. The pyrites at this place is intimately mingled with calcite and the deposit extends in an east and west direction for several miles. Another metal occurring in large quantities in New Brunswick is manganese, which is extensively mined at Markhamville, King's County. Manganese ore is found in three other places - at Quaco, Shepody mines, and near Bathurst. The copper ores of New Brunswick are mostly sulphurets, but for some reason this mining industry has not had a healthy or continued growth. Adams and Simpson's Islands and La Tete peninsula in Charlotte Co. and Salmon River in Albert Co. are the most promising places for copper mining. Galena or sulphuret of lead is the only metal of this kind in New Brunswick that is worthy of mention. It is an ore that in this region silver is often associated with. Zinc ore is not common in this Province but has been found in small quantities - at Campobello and La Tete in Charlotte Co. Antimony, a rare metal in most countries, is not uncommon in this. It is known to exist in at least four places among which Lake George in York Co. is best known, where operations have been carried on since 1862. Much of the ore is reduced at the mine and converted into metallic antimony. Among the minerals that occur in largequantities are gypsum and limestone. One of the most extensive quarries of gypsum is at Hillsboro. Some of the rocks are as white as snow. At Petitcodiac there are also large beds of gypsum, where it has a breadth of 40 feet, and is laid bare for a mile. Limestone and marble occur at many places in New Brunswick. Pure white crystalline marble and verd-antique marble are found in Portland, St. John County, and variegated red marble at Gagetown,Queen's Co. Of combustible minerals, four kinds in thisProvince are worthy of notice. Bituminous coal has been discovered at various

S.J. Daily Sun - Oct. 3, 1883 Exhibition. - Mineral Exhibit. - The Queen Mining Company, of Sussex, managed by Major Markham, furnishes amost interesting exhibit, in a small space, of manganese ores prepared for the use of consumers. The coarser or low grades are used principally in the manufacture of bessemer steel, the market for which is found in Europe; the higher grades are used in the manufacture of glass, varnishes, bleaching agents, etc., and are exported to the United States. Along with the finer ores may be seen the manganese in rocks, in which it occurs in pockets of lower carboniferous limestone, and specimens are also shown of iron ore and dog tooth spars, which sometimes occur with the manganese. Messrs. W.N. Gould and F.W. Stockton show a varied assortment of mineral ores from various districts in the Province. As these are not arranged with any degree of regularity, nor the localities given where they have been found, the display loses some of its value in consequence. Silver galena, copper, manganese and other ores are shown. Mr. Gould also has some specimens of Albertite coal, ground plaster, phosphate of lime, hydraulic limestone, gypsum, lithographic stone, asbestos and verdantique marble. The Natural History Society of New Brunswick display a fine collection of gold-bearing quartz and gold dust from the Waverley mines of Nova Scotia. The different coal companies of Nova Scotia furnish specimens of their products. Those represented at the Exhibition are the Joggins, Minudie, Acadia and Spring Hill mines, and all the different grades and qualities are shown.The different lime and brick kilns about St. Johnhave specimens of their productions on exhibition, andthe N.B. Granite Company make a handsome display both of grey and red granite. The New Brunswick Salt Springs Company showspecimens of fine and coarse salt, manufactured by them at their works, in Upham, King's County. The Lake George Antimony Mines are wellrepresented, not only by specimens of ores, but also by the different processes and materials used in the preparation of metallic antimony. The Lawrence Antimony Mine, of Queen's county, also exhibit specimens. Silver and copper ores are also shown by R.R.Call, Esq., of Newcastle, and copper ores by Dr.Goodfellow of Sussex. Very fine specimens of native copper ore, occurring in trap rock, near North Head, Grand Manan are exhibited. A map of Nova Scotia showing the occurrence of mineral ores in that Province, was sent by Dr. Gilpin of Halifax."

St. Andrews Standard - Jan. 12, 1870 From the Canada Year Book for 1870. NEW BRUNSWICK No mines of gold, silver, lead, tin, or other metals nor here under mentioned, are now being worked in New Brunswick. Iron is being raised and smelted to a limite dextent at Woodstock. There are no other iron mines worked, though available ores occur at other points. Copper - With the exception of a mine at Adam's Island, in Charlotte County, owned and worked by an English Company. ""The Casco Bay Mining Company"" - who still employ about thirty men, all the New Brunswick copper mines have been, for the present, abandoned. Manganese is being profitably worked at the ""Markhamville Manganese Mines"" in Upham, Kings County.Thirty men are employed, and the number is to be increased. In 1867-8, the trade returns show that New Brunswick exported 861 tons, valued at $19,019. Plumbago has been removed from two localities. From the first, at Portland, Saint John, 2,000 barrels, of 308 lbs each, have been taken. From the second at the Falls, Suspension Bridge, St. John, called ""The Split Rock Plumbago Mine"", - Mr. A. Garrit, director, - some twenty-five barrels a day are being taken out. Coal is now being mined in two localities only, the Albert Mine, near Hillsborough; and the mines at Newcastle Creek, Grand Lake. - It is doubtful whether the Albert coal is coal at all. Better to call it Albertine. Salt is being manufactured on a limited scale from brines near Sussex. The product might be much increased by judicious management. Lime is burned to a considerable extent at the narrows of the St. John, at the Green Point Quarries, &c.; on a limited scale at many other points. Plaster is quarried and calcined for exportation at Hillsborough. Almost all the above information has been furnished by Professor W. Bailey, of Fredericton."

S.J. Daily Sun - Oct. 19, 1889 The Mines of Canada. - New Brunswick does not take a conspicuous position in Mr. Brumell's returns, but still makes a respectable showing. Here are the items with the values as far as the returns enables the New Brunswick product to be separated from that of the other provinces. Value Grindstones ... 3,793 tons $30,729 Coal ... 5,730 tons 11,650 Graphite ... 150 tons 1,200 Gypsum ... 44,369 tons 48,764 Plaster of Paris ...50,000 bbls 31,000 Manganese (exported) ... 1,181 tons 16,073 Building Stone ... 1,953 yds 19,680 Lime ... 440,225 bush 82,993 Bricks ... 5,064 m 32,294 The statement does not include granite, which for the whole Dominion is valued at $147,305. This may be a fair statement of the value of the rough stone but it is far below that of the polished granite produced in this province alone. The returns of lime produced in the province are evidently incomplete. The New Brunswick lime exports for the year are stated at $97,318, and the value produced was, of course, considerably larger. Adding to the $300,000 credited to New Brunswick by Mr. Brumell the value of granite produced, we find that the mineral product of this province is considerably over a dollar per head for our population."

Moncton Daily Transcript - Oct. 2, 1888 The mineral possibilities of New Brunswick are greatly underestimated; and the time is not far distant when, as a source of wealth, they will be energetically developed. The statistics of output of minerals last year, are imperfectly collected, and no adequate conception of the output is at hand. The statistics collected by Mr. Eugene Coste, of the geological survey, such as they are we give. He places the mineral output in New Brunswick last year at the following rates: - Quantity ValueGrindstones... 3,582 tons $38,938 Arsenic... 100 pounds 4 Coal... 10,040 tons 23,606 Copper... 2 tons 200 Graphite... 300 tons 2,400 Gypsum, crude... 29,102 tons 29,266 Manganese... 939 1/2 tons 21,260 Granite... 6,289 tons 15,125Building stone (3 returns)... 6,871 cubic yards 52,901Lime... 478,410 103,463Brick, thousand... 6,476 43,454 – Total value... $330,667 The estimate is altogether too low. The output of grindstones and building stone are absurdly low. The output of granite is placed at $15,125, whereas $100,000 worth is known to have been shipped to the western provinces. The matter is an important one, and the bureau of statistics should

Daily Sun - Nov. 24, 1900 The Blast Furnace. - Committee of the Common Council Meet The Representatives of the Mineral Products Company. - Will Recommend That the Council Grant a Site for the Erection of a Blast Furnace With Exemption from Taxation and Water Rates. - Russell P. Hoyt, general manager, and Fritz Gleim, superintendent of the Mineral Products Co. of New York, met a committee of the Common Council yesterday afternoon relative to the construction of their proposed plant in this city. After the reading of their petition by the mayor, Mr. Gleim, being called upon, stated that for the past three years his company had been engaged in the development of manganese properties in the maritime provinces, particularly of the wad ore deposits of Albert county. He told of the condition in which the deposits were found and of the methods used in extracting and smelting the ore. Only lately had a method been discovered whereby this could be profitably done, and upon this method was based the present enterprise. There were many thousand acres of these bog ores in the province, and it was the purpose of the company to develop them all. They now wished to locate a blast furnace plant in a suitable place, and wished to know what the city of St. John would offer. He said that in company with Engineer Peters he had inspected the various properties available and found only one that was suitable. That was the lot east of Pitt on Courtenay Bay, between Sheffield and St. James streets. Plans of these lots were shown and the position discussed. That, said Mr. Gleim, was the only area that furnished sufficient width for buildings, tracks, etc. and could be extended farther out into the stream when necessary. After the works were in operation their next work would be to expend the shore and build docks and dredge channels for the accommodation of the necessaryshipping. A blast furnace in operation produced three times as much slag as regular product, and this could be used for filling in the hollows and extending the shore above and below the works. The enterprise would in time result in the extension of the entire shore. The furnace needed 50,000 gallons of water per hour for cooling purposes, but this they proposed to supply by their own pumping machinery. But they would ask the city to supply them with water for purposes of steam generation, and would like to have access to a larger supply in case of their own machinery breaking down temporarily. They proposed to make great expenditures, and the industry would in many ways be a benefit to the shipping. They would need 100 tons of limestone per day, and this would open another industry in the vicinity. They expected to produce daily about 75 tons of ferro manganese. This would also mean the production of from 150 to 200 tons of slag a day, which was an excellent street material and was used also in the manufacture of cement, etc. In answer to a question from Ald. Mcrae, he said they would employ from 125 to 200 men in St. John, and that the initial cost of the plant would be from $250,000 to $300,000. After they had used the slag for filling in their own property, the city could use it for street building, etc. Ald. Maxwell stated that the shore would have to be wharfed before slag could be dumped there, otherwise the tide would carry it out into the channel. Ald. McGoddrick asked uf Mr. Gleim had inspected the lot on which the exhibition buildings stand. Mr. Gleim said the railroad level was not so favorable there, and they could get no access to the water on account of the Sun Oil Co.'s works. In answer to a question from the mayor, he said it would take fully a year after construction had commenced before the works could be in running order. Ald. Mcrae asked him if he would accept a lease conditioned by such terms as continuous operation, time of construction, etc., and Mr. Gleim said such a proposition was only fair, but he had no authority to give a decisive answer. Mr. Hoyt mentioned the excessive and prohibitive freight rates demanded by the I.C.R. such as $1.35 per ton for ore hauled from Sussex to St. John. They had thousands of tons at their mines ready for shipment as soon as their furnace plant was erected. They owned about 15 mines in different parts of New Brunswick, but only two in Albert and Kings counties were at present being actively worked. The mayor said that the city had no control over the I.C.R., but if arrangements were completed they

would use what influence they had to have the rates reduced. Messrs. Hoyt and Gleim here retired, and after considerable discussion, Ald. Mcrae said that the hope of the city was in the establishment of manufactures here. He was not in favor of the principle of exemption, but in view of the fact that this company would certainly locate where the best advantages were offered them, he moved: 'That this committee recommend to the council that the company be granted a renewable lease for 21 years at a nominal rate of $1 per year, and that for the original term they be granted exemption from all taxes and be supplied free of charge with water for steam generation, this to be conditioned by the establishment and continued operation of a blast furnace plant for the production of ferro-manganese, and the said lease to contain agreements as to the initial cost of establishing the plant, as to the time of commencing the construction and operations of the same, and as to the use and disposal of the slag and other refuse. Carried. The lease to be granted is of the following property: All the lots owned by the city and not leased to tenants, lying between the Barrack line, so called, and St. James street, to the eastward of Pitt street and westward of the railway tracks; also the tract of 10 acres eastward of the railway track and adjacent to the above mentioned lots."

Codes: 0721 / LIME / IDX_Names: Shepody Mountain Manganese; Lime - General;
N.B. Courier - Nov. 1, 1856 ADVERTISEMENT: Prospectus of the Hopewell Chemical Manufacturing . - The Hopewell Chemical Works were erected in the vicinity of an extensive bed of manganese ore found on the north side of ""Shepody Mountain"", situated in Hopewell, Albert County, in the Province of New Brunswick, at a very large 9 outlay of Capital by the present proprietors, and are in such a state of forwardness as to require a very small additional outlay for their completion. The land attached to this establishment comprises 360 acres covering, in addition to the Manganese, a large and valuable deposit of Alumina Clay, for the manufacture of Alum. The Works are distant from the place of shipment, and on a good level road, affording easy access to the Shepody River, where vessels of 500 tons can enter for cargo. The present proprietors finding inability to complete the Works within themselves, are forced to seek for increased capital, and to effect their object have procured an Act of Incorporation, for the formation of a Joint Stock company, to be styled ""The Hopewell Chemical Manufacturing Company,"" the capital of which is £25,000, and propose to dispose at the

present time of a sufficient amount in £25 shares to enable them to complete the Works, and pay off any outstanding debts. They offer the present Works in a state of completion, according to the original design, for the Manufacturing of Acids, Alum, Chloride of Lime, Soda Ash, &c., at the cost to themselves, viz.: £12,000, to grant Stock Certificates therefor to the amount of £20,000; of which the sum of £2,000 is to be held by the Company as security for the completion of the Works, by the present proprietors, and to revert to them when the Works are finished. The remainder of the Stock, say, £5,000, to be vested in the Company for disposal only if further capital should hereafter be required for the extension of the present Works. In the vicinity of the Works are deposits of Sulphate of Iron, which maybe made available hereafter as a substitute for Sulphur at present obtained from abroad, and Limestone required for Manufacturing purposes may be very cheaply removed. The result of such investments in Britain and the United States, has been in all cases most remunerative, and so generally known as to render any estimate of profits in this Province unnecessary. The question is simple - If Work of this description in Britain, where they pay £8 stg. Per ton, and in the United States $40 for ore from this mine, affords a handsome profit to the Capitalist, can an establishment so favorably situated in every respect as the Works of this Company, fail to compete with them; - more especially with a market within 400 miles of them, that cannot be good, and which is importing largely at the present time from Britain in addition to the products of their own manufactories. The Works can be completed and the establishment in thorough working order within a period of two months, and at an expense of £3000, and it is determined to 10 proceed there with as soon as the small sum of £3000 is subscribed, as that sum will enable the present proprietors to finish the Works and pay off all liabilities now existing against the property. Officers of the Company: James Steadman, President S.D. Berton } W.H. Harrison } J.A. Morrison } Directors L.W.M. Irish } Thos. Main } Jas. Rogers } William S. Berton, Secretary July 21, 1856 (an20tw)"
Moncton Daily Times - Oct. 6, 1882 Professor Gould after working, with two men, on the property of Mr. D. McRae, Curryville, was able to secure a lot of excellent samples of silver which he sent away for test. He has since leased the property, havinglearned that the samples gave a very large percentage:- We hear that a company of moneyed men, on the recommendation of Prof. Gould, are about to purchase the copper and manganese mines of the Robinson farm, Chemical Settlement. While Mr. T.C. Weston, mineralogist and one of the oldest members of the staff of the Dominion Geological Survey of Ottawa was searching specimens at Curryville, last week, assisted by Mr. Thos. McHenry, he found some excellent samples of jasper and marble. Bothappear to give evidence of heavy deposits, and are said to be of superior quality. Here is a chance to pen up a fine marble quarry."

S.J. Daily News - Jul. 2, 1875 Black Lead. - The St. Stephen Journal says:-Black lead is said to have been discovered in paying quantities on Mr. Lyle's Farm at Moore's Mills about three fourths of a mile from the locality where the gold bearing quartz was recently found."

Codes: 2027 / E5 / GYP / Y1 / IDX_Names: Bull Moose Hill Iron; Sussex/ Plumwesweep Salt; Gypsum;
LIME / D7 / Salt Springs Salt; Lime - General; Kings County Coal;
Daily Telegraph - Aug. 13, 1880 Kings County. - ..... Coal. - Some search has been made for coal, but hitherto with only partial success. Some loads of bituminous coal, closely resembling that of the Springhill mines, has been mined quite near the surface on the lowlands near Stone's Brook, at Dunsinane mills. Specimens of unmistakeableAlbertite were found some years ago in Mechanics' Settlement, and some land property changed hands at a good valuation in consequence, but the discovery was not further developed. More recently, Albertite has been discovered on the lands of Mr. George Teakles, at the head of South Branch, Cardwell, and a considerable effort has been made to test its value. Salt has been manufactured on a small scale for agreat many years beside the old Post Road, and midway between Penobsquis and Sussex. The manufacture is carried on by Mr. Mercer, the lessee of the property, by boiling in iron boilers, producing ten or twelve bushels a day, we are told. The excellent quality of this salt for dairy purposes is so well established that good butter makers in the vicinity will have no other, even though they may have to pay double the cost of other salt for it. Purchasers of butter in the city also not infrequently inquire as to what salt butter which they propose to purchase is preserved with, a preference being given, whether on real or imaginary grounds, for butter flavored with Sussex salt. Of several natural brine springs in the county only one other has yet been utilised. This is located at Salt Springs Settlement, Upham, some three or four miles distant from the St. Martins and Upham railway. The spring is a remarkably large one, and the salt produced a few years ago was apparently of equal excellence with the Sussex salt. The works are now out of repair and idle. There are here some remarkable indications that the salt deposit is not far from the surface, as in several places the earth has settled and fallen in, in some spots quite recently, which is believed to be occasioned by cavities underneath formed from the dissolution of the salt, which finds it way to the surface in the brine of the spring. It is not probable that the manufacture of salt will even be productive of large profit until a stronger brine or the rock salt itself is reached by boring as is done at Clinton, Seaforth and Goderich, Ontario. Salt is there very largely and profitably manufactured out of brine formed in the salt beds a thousand feet deep and pumped to the surface, boiled in immense boilers 120 feet long and 20 feet wide. There is good reason to believe that salt would be struck at half this depth at some points in Kings if borings were made and that the venture would prove a highly profitable one if undertaken. Plaster, etc. - Among other economical mineral products are plaster orgypsum, which is found in several sections of Kings and has proved an excellent fertilizer. Notwithstanding that it is native to Sussex there are still extensive importations of plaster chiefly from Petitcodiac. Lime stone crops out extensively in almost every section of Kings. Kilns for burning it are also quite numerous, including a large one on the farm of Mr. Wm. Pugsley atSussex. Lime is coming more and more into use

as a fertilizer and with excellent results. Iron ore of excellent quality was reported yearsago as existing at Bullmoose Hill, in Springfield, and bog iron in several localities near Sussex, but as yet nothing has been done to develop their value."

Codes: 2027 / G3 / LIME / GEOL / IDX_Names: Bull Moose Hill Iron; Granite; Lime - General; Geology - General;

Weekly Observer - Mar. 3, 1840 Second Report on the Geology of New Brunswick by Dr. Gesner. - We have perused this Second Report with great pleasure, first, because it is written in a very easy and pleasing style, avoiding technicalities as muchas possible, and secondly, because it conveys the gratifying information that New Brunswick possesses within herself hidden treasures, greater even than were anticipated by the most sanguine, and which lead us to expect that further and richer discoveries may follow those which have already been made by the enthusiastic zeal and laborious research of our Provincial Geologist. The tract of country under examinations the past season is situated eastward of the Saint John. A line from the entrance of Bellisle River to Shediac will mark its northern side; its eastern limits are fixed at Cape Tormentine and its southern side lies along the shore of the Bay of Fundy, and the Nova Scotia boundary, or isthmus between the Cumberland Basin and the Gulf of St. Lawrence. The length of this tract is about one hundred and thirty miles, and its mean breadth forty-five miles; it embraces the Counties of Kings, St. John, and Westmorland. We have not sufficient knowledge of Geology to follow the writer through the various details connected with the survey of this valuable portion of the Province, but would barely notice some of the leading features of the Report. Of these, the great Coal Field of the County of Westmorland is by far the most important and striking in its character. This great Coal field commences at Shediac and extends along the eastern shore as far as Tedish River, thence running along an irregular line southward it approaches Sackville and meets the new red sand stone near Dorchester Island. A line drawn from Shediac to the Petitcodiac about ten miles below the Bend, marks its northern side. To the westward of the Petitcodiac the coal field becomes more narrow, but maintains an average breadth of ten miles westward until it reaches Sussex Vale; here its extremity is forked; one branch is curved northwest until it meets the source of 6 Studholm's Mill stream, the other becomes very narrow, and disappears a few miles southwest of Sussex church. The whole length of this coal field is upwards of seventy miles, and its average breadth about seventeen miles. The remaining part of the country explored is composed chiefly of new red sandstone, and conglomerate, containing numerous deposits of gypsum, limestone and rock salt, with mineral springs. At the close of the season, Dr. Gesner discovered in the greywacke system, near this city, some fossil trees, accompanied with anthracite coal; and fine specimens of the cactus accompanying indications of the same description of coal, were found in Charlotte street, near the residence of his Worship the Mayor, and also in King's Square. - These discoveries were made in consequence of the cuttings made for levelling the streets, and open a wide and curious field for enquiry. The fossil trees were discovered on the north side of Little River near the Bridge, upon land owned by J.R. Partelow, Esq., in a quarry which had been opened to supply stone for the new Penitentiary. In removing the rock, the trunks of two large fossil trees were exposed, and several of smaller dimensions. The largest was two and a half feet in diameter, and ten feet of its trunk was exposed; the other was sixteen inches in diameter and nine feet long - both were nearly cylindrical. The original trunks are now composed of sandstone, anthracite and sulphuret of iron; the vegetable fibre of the plants still remains distinct, and is now represented by these minerals. These trees belong to the fir tribe; other small plants and impressions of leaves were also found, among them a calamite, a species of reed. According to the latest discoveries, these plants belong to the first classes of vegetables that ever flourished on the earth; they are different from any now growing on its surface, and are relics whose history cannot be traced, reminding the Geologist of the changes each kingdom of organic nature has sustained, since they were first established on this globe. The various discoveries which were made public by Dr. Gesner's first Report, have already, in several instances, been made available, and we have no doubt that those comprised in this second report will call theenergy and enterprise of the people of the Province into operation most profitably. The marl discovered near St. Andrews last year, has already been extensively employed in enriching the soil - the excellent granite on the St. John, at the head of the Reach, is now being quarriedvery extensively, and we shall this year see it employed in the rebuilding of the burnt district, and be quite independent both of Nova Scotia and the United States for the necessary supply of that most useful and durable material. But for the researches of the Provincial Geologist this granite might have remained undiscovered 7 for many years, and we should still have continued importing an article which exists so very near to us, in abundant quantity, and of superior quality. Limestone has been discovered in many places and pointed out to the neighboring farmers, who have almost invariably availed themselves of it. Numerous lime kilns have been established in places where a few years since no limestone was supposed to exist, and lime could only be procured at much expense and with difficulty. The greatdeposit of iron, in Queen's county, has also attracted attention, and as we understand, has been brought under the notice of some English capitalists, who intend prosecuting inquiries respecting it the coming season, and we trust it may prove all that they anticipate. The discovery of the Westmorland coal field has already raised up a host of petitioners for mining leases, and we observe that a special committee of the House of Assembly has been appointed to take the various petitions into consideration, and decide on the best course to be adopted for the interests of the province. If the unassisted labours of Dr. Gesner during two seasons have effected so much, what may we not expect if those labours are continued, and a liberal provision made for carrying them on more extensively, and in a more minute manner. We trust that the Legislature in their wisdom will see the propriety of following up these researches without delay, and on a more extensive scale, for we believe the real interests of the country will thereby be consulted, and many advantages derived, not only in an Agricultural, but a Commercial point of view. Meantime we recommend a perusal of the second Report, confident that it will afford much pleasing and instructive information to every inhabitant of New

Weekly Observer - Mar. 3, 1840 Second Report on the Geology of New Brunswick by Dr. Gesner. - We have perused this Second Report with great pleasure, first, because it is written in a very easy and pleasing style, avoiding technicalities as much as possible, and secondly, because it conveys the gratifying information that New Brunswick possesses within herself hidden treasures, greater even than were anticipated by the most sanguine, and which lead us to expect that further and richer discoveries may follow those which have already been made by the enthusiastic zeal and laborious research of our Provincial Geologist. The tract of country under examinations the past season is situated eastward of the Saint John. A line from the entrance of Bellisle River to Shediac will mark its northern side; its eastern limits are fixed at Cape Tormentine and its southern side lies along the shore of the Bay of Fundy, and the Nova Scotia boundary, or isthmus between the Cumberland Basin and the Gulf of St. Lawrence. The length of this tract is about one hundred and thirty miles, and its mean breadth forty-five miles; it embraces the Counties of Kings, St. John, and Westmorland. We have not sufficient knowledge of Geology to follow the writer through the various details connected with the survey of this valuable portion of the Province, but would barely notice some of the leading features of the Report. Of these, the great Coal Field of the County of Westmorland is by far the most important and striking in its character. This great Coal field commences at Shediac and extends along the eastern shore as far as Tedish River, thence running along an irregular line southward it approaches Sackville and meets the new red sand stone near Dorchester Island. A line drawn from Shediac to the Petitcodiac about ten miles below the Bend, marks its northern side. To the westward of the Petitcodiac the coal field becomes more narrow, but maintains an average breadth of ten miles westward until it reaches Sussex Vale; here its extremity is forked; one branch is curved northwest until it meets the source of Studholm's Mill stream, the other becomes very narrow, and disappears a few miles southwest of Sussex church. The whole length of this coal field is upwards of seventy miles, and its average breadth about seventeen miles. The remaining part of the country explored is composed chiefly of new red sandstone, and conglomerate, containing numerous deposits of gypsum, limestone and rock salt, with mineral springs. At the close of the season, Dr. Gesner discovered in the greywacke system, near this city, some fossil trees, accompanied with anthracite coal; and fine specimens of the cactus accompanying indications of the same description of coal, were found in Charlotte street, near the residence of his Worship the Mayor, and also in King's Square. - These discoveries were made in consequence of the cuttings made for levelling the streets, and open a wide and curious field for enquiry. The fossil trees were discovered on the north side of Little River near the Bridge, upon land owned by J.R. Partelow, Esq., in a quarry which had been opened to supply stone for the new Penitentiary. In removing the rock, the trunks of two large fossil trees were exposed, and several of smaller dimensions. The largest was two and a half feet in diameter, and ten feet of its trunk was exposed; the other was sixteen inches in diameter and nine feet long - both were nearly cylindrical. The original trunks are now composed of sandstone, anthracite and sulphuret of iron; the vegetable fibre of the plants still remains distinct, and is now represented by these minerals. These trees belong to the fir tribe; other small plants and impressions of leaves were also found, among them a calamite, a species of reed. According to the latest discoveries, these plants belong to the first classes of vegetables that ever flourished on the earth; they are different from any now growing on its surface, and are relics whose history cannot be traced, reminding the Geologist of the changes each kingdom of organic nature has sustained, since they were first established on this globe. The various discoveries which were made public by Dr. Gesner's first Report, have already, in several instances, been made available, and we have no doubt that those comprised in this second report will call theenergy and enterprise of the people of the Province into operation most profitably. The marl discovered near St. Andrews last year, has already been extensively employed in enriching the soil - the excellent granite on the St. John, at the head of the Reach, is now being quarriedvery extensively, and we shall this year see it employed in the rebuilding of the burnt district, and be quite independent both of Nova Scotia and the United States for the necessary supply of that most useful and durable material. But for the researches of the Provincial Geologist this granite might have remained undiscovered for many years, and we should still have continued importing an article which exists so very near to us, in abundant quantity, and of superior quality. Limestone has been discovered in many places and pointed out to the neighboring farmers, who have almost invariably availed themselves of it. Numerous lime kilns have been established in places where a few years since no limestone was supposed to exist, and lime could only be procured at much expense and with difficulty. The greatdeposit of iron, in Queen's county, has also attracted attention, and as we understand, has been brought under the notice of some English capitalists, who intend prosecuting inquiries respecting it the coming season, and we trust it may prove all that they anticipate. The discovery of the Westmorland coal field has already raised up a host of petitioners for mining leases, and we observe that a special committee of the House of Assembly has been appointed to take the various petitions into consideration, and decide on the best course to be adopted for the interests of the province. Daily Telegraph - Oct. 8, 1864 Exhibition. - ... Mr. Wm. Rogers, St. John, has sent some of his lime which he need hardly have taken the trouble to do, as every body knows that it is good. Joe Brand of Sussex shows a sample of salt from Sussex, King's county. It is really a beautiful article for table use, and if it could be but produced in quantity would command a large sale. It is a great pity that these salt springs cannot be wrought to advantage. I understand that all that is wanting is the necessary capital, on which account it is to be hoped such valuable products will not much longer be lost

St. Andrews Beacon - Jan. 28, 1897 The Tariff Inquiry.- ... The Albert Manufacturing Company favored an increase rather than a decrease on plaster of paris. They would cheerfully welcome reciprocity on calcined plaster. Mr. Osman told the commission that he would give up his business in Canada for the privilege of selling in the Boston market alone... The limeburners desired a reciprocal agreementwith the United States. The granite-workers pleaded for an increase of 10p.c. on finished material to protect them from the Scotch dealers. Low wages and advantageous freight rates favored the Aberdeen granite dealers. Should the American duty be raised they desired a corresponding increase to shut out the Scotch. Sir Richard asked them if it was only the finished stone they had to compete with and they said that it was. From the last blue book he showed them that the importation of rough granite had been $37,000 and the finished $6,000. The gentlemen assured Sir Richard that the blue book must be wrong."

N.B. Reporter - Jul. 1, 1874 Our Mineral Resources. - Speaking of the undeveloped resources of New Brunswick, a writer in the Colonial Farmer observes:- ""Dr. Rouse informed us that he had discovered a bed of coal not far distant from this place of thequality known as anthracite. Antimony is also found in large quantities. There are undeveloped as yet, large mines of tin and zinc, but its quarries of lime and marble, with various kinds of granite, will probably prove the greatest sources of wealth to the Province. We have been shown lately by James Rouse, M.D., (a scientific geologist, formerly a resident of the Southern States, but who has made his home for the last ten or twelve years principally in New Brunswick, and devotes all his spare moments outside of his profession todevelop the resources of the country,) some specimens of marbleized granite. It is beautifully variegated with a variety of rich and beautiful colors, viz: dark red, pale blue or water color, pale red, orange, black and white, so mixed and arranged as to form different shades and fantastic figures. This beautiful specimen of conglomerated rock contains five orders: crystal, quartz, feldspar, mica, agate, and silica, susceptible of receiving the highest polish. This quarry of rock is situated on the banks of the St. John river, about thirty five miles from this place, near the mouth of the Pokioc river, which here enters the St. John at what is called the Pokioc Eddy. The rock lies in sheets or layers extending down to the water's edge, gradually rising as we leave the river; one layer piled upon another. These layers vary in thickness from two to twelve feet. It is easily worked, splitting freely as the best of granite, and is much easier drilled than the common granite. Its breadth on the river is about forty rods, and extends back about one mile. Its main elevation above the river is about 180 ft. It has been examined by the best judges of granite in New York, Philadelphia and Boston, also by quarry men from the red granite quarries in Scotland, who have pronounced it the best quality in colored variegated granite in the world. It will undoubtedly be a great acquisition for ornamental and fancy work, as well as monuments, etc. We understand parties are now negotiating to commence operations. The work will employ a large number of hands, and make business up and down the river. There is a deep eddy at the base of the ledge which will receive the wash rocks; also a stream of water running over a portion of the ledge of sufficient quantity to be utilized in doing all the cutting and polishing. There is good approach by water to the quarry, and good water transit to the Bay of Fundy. It is rarely we find anything of that kind so convenient to water communication. Besides these quarries the Dr. has discovered at Canterbury, near the N.B. and Canada railroad, extensive lime quarries, which so far as have been worked, seem to be of the best quality. He has erected one kiln and is about to build more. For plastering or cement it is superior to most other kinds of lime, owing to its strength, durability and

Daily Telegraph - Feb. 5, 1891 Thousands Can Get Work. - How Reciprocity Would Affect Three Big Industries. - Mr. F.T.C. Burpee Gives a Practical Expression of Opinion in Regard to the Possibilities and Probabilities of Red Granite - Another Lime Manufacturer Speaks Out - A Lumber Shipper Talks. - I am not anxious to have my name in the papers, said Mr. F.T.C. Burpee, yesterday, but I am willing to give you the information you seek in reference to the red granite industry, in which I am engaged. During the last summer, I have been thinking of moving all my machinery to the United States and finishing the stone there, instead of here. Quincy, near Boston, is the location I have had in view, though I have had inducements to go to towns in Maine. I already have some machinery at Quincy, for finishing work, and unless we can get reciprocity I will have to go there with the greater part of what is here, and perhaps the whole of it. What reasons have you for the contemplation of such a step? To avoid the great expense to which I am now put in getting the work finished there. The duty on rough stone, raw material, is 11 cents a foot, while that on finished work is 40 per cent ad valorum. Red granite is the favorite stone in the United States, but when we send it there to be finished, the men who have their own stone to sell make it difficult for us to compete with them. If we finish it here, and give employment to our workmen, we have to pay the 10 per cent tariff. The more work our men do, the more it costs us to get the stone into the United States. The better the finish the more duty we have to pay. This would be avoided if we had free trade, or if our works were there instead of here. Would you not have to pay higher wages there? Yes, and I always want to pay as high wages as the business will afford. I do not believe in grinding men down if it can be helped. I could afford to pay better wages, for I would have a larger market than I can have under the present state of things. How many men do you employ at your finishing works in Carleton, when business is fairly brisk? About 85, though there have been as many as 100 or so. Stonecutters get from $2 a day up, while ordinary laborers get from $1.50 a day up. I would like to have the rate not less than $1.50 and would be glad to employ more men. If we had no duty to pay on manufactured granite, our market would be all the United States. If we had reciprocity, I do not think there is any exaggeration in saying that this industry alone would employ thousands of men, where only a few hundred are engaged at the present time. I do not know how many might be employed, but I am not afraid to say there would be thousands. It would be quite within reason to say so. I would not think I would be doing any great thing if in the course of a year or two, under reciprocity, I myself employ 1,000 men. The manufacturers of granite would be one of the greatest industries in this country, if we could get building work into the United States free of duty. They have no stone that they like as well as ours and they want whole buildings of it. Is the United States your chief market now?' Yes; the greater part of what we make goes there, and we have a better profit on it than on that sent elsewhere. All that we send now is but a small proportion of the granite that is used there. They use native and some Scotch granite, none of the varieties of which are as good as that sent from New Brunswick. Labor is cheap in Scotland and freights are low, so that the Aberdeen stone has a good chance to compete with any other. But what about the markets for your stone in Canada, under protection? It does not amount to anything, as compared with the market in the United States. They have a wealth and population there. Besides, a good deal of Scotch granite is sent to Ontario. I am told by those who have looked into the matter that Aberdeen stone can be sent there - I think Kingston was the point in question - as cheap as we can send St. George stone from here. But in any case our market is the United States. You have said that reciprocity would lead to the employment of many more men in the manufacture of granite here. Would their wages be higher than they are now? I should think a better arrangement between the two countries would increase wages here, and it would cost less for people to live, when the duty on flour, pork, etc., makes living high. But it is contended that flour costs no more under a tariff than without one. Well, all I know is this. I buy my flour from a St. John man whom I consider as reasonable in his charges as any one. I went to him to buy some flour just before the protective tariff came in force. He could not tell me the price until the new duty was declared, and then 25 cents a barrel was added. It has never been taken off from that day to this. Then, there seems little doubt that, as regards the granite industry, reciprocity would be a good thing! It would. There is not a fair show with the present tariff. It is more than 25 years since operations were begun at St. George, but the granite industry is not increasing in this province, though the products of our works are in demand in the United States. England sends them more than we do - I should judge fully 10 times as much. The old country stone is good enough, but it is not as good as ours. Why, one man in New York imports more than we can deliver as things now are. The tariff does not give us a fair show at all, but its removal would be the making of an enormous business, while our investment does not begin to pay as it is now. It is a hard business to carry on, requiring as it does a large capital and the holding of a heavy stock all the time. Unless there is some change, I do not see any course but for me to remove my machinery to Quincy, as I have already said. Apart from your own business, what is the idea of the effect of reciprocity on industries in general. I believe it will be of benefit to all classes. Everyone must know what the effect of it would be on lumber, shipping and other industries. I should think the farmers would all be in favor of it, for, as things are now, they do not get as much as they should for what they raise, and have to pay more than they should for what they consume. However, I do not undertake to speak of the effect on any business but my own, and of that I think I have a good idea. Views of Another Lime Manufacturer. The tariff has killed St. John's lime business in its infancy - an infancy which gave promise of a rapid growth. The duty must come off, or St. John's kilns, which had begun to multiply rapidly before the passage of the McKinley bill, will not open with the coming spring. Read the facts. Mr. Charles Miller, the well known lime burner, was asked yesterday by a Telegraph reporter what effect reciprocity would have on the lime business. It would have a very good effect, indeed, said Mr. Miller. You see, we used to pay a duty of only three cents a barrel; now we pay from 12« to 13 cents. My kilns are at Robinson's Point, or Pokiok, and if I worked them to the full capacity I would turn out about 10,000 barrels, but I have room for a much larger business if I only had a market to sell in. That is what is cramping the lime business in St. John. The lime business has been dull of late? The McKinley bill cramped the business. There is not the slightest doubt that several new kilns would have been built last season if it had not been for the tariff talk, and finally the passage of the bill by the United States. It frightened people and the kilns were not built. What if the duty were taken off lime? There can be no doubt about the effect. There would be a great increase in business. There would be a boom even if the duty were made what it was before. That, of course, would be all very well, but there is no doubt that reciprocity is what we want. Did business decrease last year? The output last year was less than the year before, all things considered. For a few years past the trade developed rapidly. People were building new kilns and the business was doubling year by year on this account. Just lately trade has been dull in the United States, and on account of the McKinley bill a great deal less lime has been made this year than would have been turned out had there been no increased tariff. Were the kilns worked to their full capacity during the past season? No. If we had a free market, or even the old duty, we could have increased the output one-third with the present kilns. How much lime can St. John make at present? Well, one kiln should turn out 25,000 or 30,000 barrels in a season. We close down for two or three months in winter, and so our working season is about nine or 10 months. There are, in and about St. John, 24 or 25 kilns, and reckoning at 25,000 or 30,000 barrels each, the output would be something over 500,000 barrels. What proportion of this is shipped? I ship about two-thirds of mine, but some of the burners, the larger ones, send practically all their lime to the states. Is there plenty of material to develop the trade if the duty were taken off? There is no end to the rock. Of course you must understand that many of the more favorable sites are already occupied, but there is plenty of room yet. Do you think the trade would increase? I have no doubt that within two years from today the kilns would be doubled. The largest amount ever exported from St. John would soon be doubled if we had other business, it would take a little time to work up the trade. Of course, the coasting trade would be benefited? Seven-eighths of the lime goes by vessel. The fact is that, if we had an open market, we have the finest place in the world to make lime. There would be no trouble about it at all. What advantages have St. John burners over those in Rockland? Our rock is handier and our wood cheaper. Of course our freights are higher, but the other advantages more than counterbalance that. Our stock and labor is cheaper as a rule. If the duty were removed they couldn't compete with us. The duty, though, was put on to protect Knox county. Had it not been for that St. John would have been far ahead of its present position in the business. The fact is the business is only in its infancy. Mr. Stetson has only been here three or four years, and now he can probably make 200,000 barrels. But there is little or no money in the business at present, and the duty has a greater effect upon the burners who export their whole stock. About two thirds, or more, of the lime made here is exported. The domestic trade is well looked after now, the lime made by new kilns would all be exported. The fact of the matter is, the tariff is a great blow to the lime business in every way. How would reciprocity affect trade generally? I have no doubt it would greatly benefit these provinces. I don't know that I can say much more than that in regard to trade generally, but as regards the lime business I can speak without trouble. You can see what a big item this tariff is in our business. Taking the difference between the old duty of three cents and the new one of 13, we have a difference of 10 cents a barrel which means simply that we have to pay about $50,000 a year to get our lime into the market at all. This is the case now, when, as I have said, the trade is in its infancy in St. John. If we had unrestricted reciprocity more than $50,000 yearly would be saved and the capacity of the kilns would be rapidly

Morning Telegraph - Sep. 9, 1865 The Town Of Petitcodiac. - ... The Petitcodiac Mining and Manufacturing Company have their headquarters here. They have spent a large amount of money in the purchase of land, erecting a building, securing limestone and plaster deposits, and improving the property. The land obtained by the company has proved to be an excellent investment, and the extent of the plaster and lime rock which they control is almost unlimited. Steam power is used in the mill; and arrangements are making to extend their operations and furnish a manufactured article equal in quality to any in use. The stock of the company has been freely taken, and it is hoped that the enterprise will result successfully. A large portion of the stock is held in St. John, although Petitcodiac, Salisbury, Moncton, and other places subscribed handsomely. The extent of plaster and lime rock available at and near Petitcodiac is something enormous - there are mountains of it. And in this connection it may be noticed that the North River flows only a stone's throw distant from the Railway station, and that the water power on this North River would turn all the plaster mills that could be crowded upon its banks. But the buried wealth of the country adjacent to the station consists not of plaster alone; there is good reason for believing that petroleum exists within a few miles of it - salt springs are found at places not many miles distant, and in different directions, while traces of oil have been found on the surface. Large tracts of ""oil sands"" have already been secured by gentlemen who are supposed to know what they are doing... the lime and plaster deposits will yet be mines of wealth; and the probability of its becoming a great oil producing region will always make it a place of interest."

Royal Gazette - Mar. 22, 1854 Cap. II An Act to incorporate The Albert Manufacturing Company Section. Section. 1. Company incorporated 5. President and officers; with general powers. Supplementary and general 2. Capital; power to powers. increase; votes; payment 6. Shares to be personal of stock. property and assignable. 3. First meeting to organize.7. Liability for debts. 4. Annual meeting for choice 8. Forfeiture of Act, how of Directors. incurred. 9. Right of Way, how obtained. Passed 20th March, 1854. Whereas the Township of Hillsborough, in the county of Albert, possess advantageous situations for the 2 building of Mills for manufacturing Lumber, Plaster andother articles, and for quarrying Plaster, Lime Stone,Marble and Free Stone, and for Mining purposes: And whereas in order to procure the requisite capital, it is desirable to incorporate into a body politic and corporate such persons as may be willing to advance fundsfor such undertaking; Be it therefore enacted by the Lieutenant Governor, Legislative Council and Assembly, as follows:- 1. That Calvin Tomkins, William H. Steeves, and Walter Tomkins, and their associates, successors and assigns, be and they are hereby erected into a Body Politic and Corporate, by the name of ""The Albert Manufacturing Company,"" and by that name shall have a common Seal, sue and be sued, plead and be impeded, answer and be answered unto, defend and be defended in all Courts and places whatever, and shall have power and authority to purchase, hold and enjoy lands, tenements and hereditaments, for them, and their successors and assigns, and all other powers and privileges now incident to a Corporation by Act of Assembly of this Province, for the purpose of building a Mill for manufacturing lumber, plaster and other articles, and trading in the said articles; quarrying plaster, lime stone, free stone, marble, and other building materials, and trading in the same, and conveying the same to market; opening and working mines, and transacting other business connected therewith; and constructing and making such rail roads or other description of roads as may be deemed necessary for the transportation of such articles from the quarries to the place of shipment; and also that they the said Company, or a majority of them, shall from time to time and at all times have full power and authority to constitute, ordain, make and establish such bye laws and ordinances as may be deemed necessary for the good rule and government of the said Corporation, provided that such bye laws and ordinances be not contradictory or repugnant to the laws and statutes of this Province, and those in force within the same. 2. The capital stock of said Corporation shall

be fifty thousand pounds current money of the Province of New Brunswick, with liberty to increase the same to the sum of one hundred thousand pounds, to be divided into shares of twenty five pounds each, to be paid in at such times and installments as the business of the said Company shall require; and every person who shall be the holder of one or more shares, shall be entitled to vote either in person or by proxy, having one vote for each share as aforesaid; and it shall be lawful for said Corporation to take lands, quarries, buildings, wharves, machinery, mining rights or privileges, in the place of money, in payment of any instalment or instalments due on any stock subscribed therein, at such valuation as a majority of all the subscribers shall fix, said payment 3 to become void if satisfaction titles or conveyances to the Corporation be not made at such a period as said Corporation may by any bye laws or vote direct after its organization. 3. The first meeting of the said Corporation shall be held at Hillsborough, in the County of Albert be called by William H. Steeves, or in case of his death, neglect, or refusal, by any two of the said Company, by giving notice in one or more Papers printed in the City of Saint John, in this Province, at least thirty days previous to such meeting, in order to organize the said Company, and for the purpose of establishing bye laws, and choosing such number of Directors as by the said bye laws may be prescribed; which Directors so chosen shall continue in office until the first annual meeting, or until re-election, or others are chosen in their stead; and the members of the said Company, or shareholders present, or appearing by proxy, shall organize said Company, establish bye laws, and choose Directors of the said Company, by a majority of votes. 4. The shareholders shall meet annually at such time and place as may be appointed and regulated in and by the bye laws of said Company, at which meeting the shareholders present in person, or by proxy, may either continue in office the Directors before appointed, or any number of them, or may elect a new body of Directors to supply the place of those not continued in office; provided always, that the omission to meet shall work no forfeiture, but the shareholders may be afterwards called together for that purpose, by one or more of the Directors of the said Company for the time being, or by any three of the shareholders. 5. The Directors of the said Company, or a majority of them shall choose a President and such other officers as they may deem necessary, who shall hold their respective offices until others are chosen in their stead; and the Directors, or a majority of them, shall have full power and authority to manage the concerns of the said Corporation, subject to the bye laws thereof, and the regulations herein contained, may appoint and employ any agent or other persons by them deemed necessary, and may declare dividends of the profits according as the interests of the Company may admit or require; but no person shall be eligible as a Director unless such person is a stockholder, and over twenty one years of age; nor shall any sale or purchase of real estate be made by them, except by consent of two thirds of the stockholders, voting as provided in Section second. 6. The shares of capital stock in the said Corporation shall be deemed personal property, and each shareholder thereof shall be entitled to a certificate for the number of shares subscribed or held by him, which certificate shall be signed by the President and Clerk or 4 Secretary of the said Corporation and shall certify the property of such shareholder in the said shares; and the shares of the said Corporation shall be assignable in such manner and form as the bye laws may prescribe, and the assignee of any share or shares shall be a member and stockholder in the said Company; and whenever any shareholder shall assign or transfer all of his stock or shares in the said Corporation, he shall cease to be a member 7. The joint stock and property of the said Company shall alone be responsible for the debts and engagements of the same. 8. Provided always and be it enacted, that unless ten per cent. of the capital stock shall be paid in for the purposes of the Corporation, and a certificate of such payment, signed and verified on oath by the said Directors, or a majority of them, (which oath any Justice of the Peace is hereby authorized to administer), shall be filed in the Office of the Secretary of the Province before the expiration of three years after the passing of this Act, the operation of this Act shall cease, and the existence of the said Corporation be terminated at the expiration of the said three years. 9. And whereas also it may be necessary for the said Corporation to obtain a right of way for a rail road or other road, over the lands of other persons, from their quarries to their wharves or place of shipment; Be it therefore enacted that in case where the Corporation cannot amicably agree with any person or persons as to the value of, or damage done to his or their lands, by the making of any rail road or other road by the said Corporation, from their said quarries to their wharves or place of shipment, then it shall and may be lawful for the said Corporation to obtain from two Justices of the Peace for the County where the said lands may lie, an appointment in writing under their hands, of disinterested freeholders of said County who shall under oath to be adminstered by either of such Justices, appraise the fair value of the land to be appropriated for said rail road or other road, or the damages thereof, to the said party or parties over whose land the same may pass; and upon the payment by the said Corporation of the amount of such value or damages to said party or parties, or upon a legal tender of the same by the Corporation or their Attorney for that purpose appointed, it shall and may be lawful for the said Corporation, by their servants, agents, or hired men, without further notice, to constuct such rail road or other road, and to pass and repass over the same at all times and with such things and in such manner as they may think fit; provided that if the owner or owners of any such land required for the for the purpose of such rail road or other road, be absent out of this Province, or cannot be found therein, or be incapacitated by reason of insanity, infancy, 5 coverture, or other disability, to receive said money or a tender thereof, then payment by the said Corporation of the amount appraised to such absent

SPRI / GEOL / Salt; Lime - General; Mineral Springs; Geology - General;

N.B. Courier - Sep. 30, 1837 LETTER III. To His Excellency Major General Sir John Harvey, K.C.H. and C.B., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency: Resuming the subject of my last letter, and the route from Petitcodiac River along the main road to Saint John,I found the road after leaving Holstead's Inn, to pass over a considerable hill called the Portage. The rocks of this hill are sandstone of the coal measures; and among them fossil Cacta Calamide and impressions of leaves are visible where the strata appear at the surface, which in general is covered with a meagre soil. The Portage is four miles long, and although narrow and uneven, is very pleasing on account of the pretty grooves on each side, and the thick clusters of birch and maple like festoons overhanging the way. From this place the waters of the Petitcodiac find their way into Chignecto channel; while those of the Kennebecasis take an opposite direction and escape into the River St. John. This elevation seems like a barrier set up between the two streams, notwithstanding some of their ultimate branches meet each other. Sussex Vale or Pleasant Valley (names applied tothe same place by many persons) is twenty miles in length, and averages perhaps, from one to two miles in breadth. Its course is nearly southwest, and it extends from the Portage to Lyon's Inn at the mouth of the Mill Stream. The hills on each side are of grey sandstone and conglomerate which not only affords a shelter from cold winds, but reflect much heat upon the lower grounds between them. New red sandstone occupies the principlepart of the valley. This rock is, however, covered at atmany points with beds of clay, sand, and gravel.Southward there is a tract of mountainous country evidently connected with the high lands already noticed, and like them is probably composed of primary and transition formations. A large salt spring flows from thered sandstone of Sussex Vale, which notwithstanding, it has been worked on a limited scale, has supplied considerable quantities of salt. There are similar springs a few miles northward, where the saliferous rock is accompanied with beds of gypsum and limestone, extending to Butternut Ridge. It is probable that a bed of rock salt might be discovered at this place, but its 7 distance from any navigable river, would render the transportation of the article too expensive to be profitable, and therefore the springs only possess the minor advantage of supplying the country near them. Almost the whole of Sussex Vale is in a state of agricultural improvement; the uplands are excellent, and the intervale affords abundant supplies of hay. Cultivated by an industrious population, the earth sends forth her richest rewards to the intelligent and active inhabitants. Near the Church there are some beautiful spots; the winding river with its intervale, studded with elms, and the deep valley skirted with snug farms, and embraced by a chain of hills, having here and there a lofty peak - the whitened cottage - the poplar-shaded mansion; all combine to strike the eye and prove the fertility of the district. After crossing the Bridge over the Kennebecasis at Roach's farm, the hill along the north side of the road is composed of conglomerate, which extends a number of miles without being covered with other deposits. This rock may be seen well at Lyon's farm, near Millstream bridge. It is of a coarse kind and composed principally of pebbles of quartz, firmly cemented together, argillaceous matter and oxide of iron. All the pebbles have been rounded and partially polished by attrition, and from the close resemblance they bear to pebbles found in the channels of rapid streams, or on the shores of the sea, in the absence of other causes producing similar effects, there can be little doubt, they have assumed their spherical figures from being rolled by the violence or after passing along the bed of some ancient river. The present compact texture of the rock has been produced by the nature of the cement, and the pressure it has sustained. Many curious enquiries might be instituted to ascertain from whence these pebbles came, but they would be attended with difficulty, and are foreign to my present purpose. At Mill Stream bridge the valley terminates, and the hills forming its sides approximate each other so nearly, that there is only sufficient room for the Kennebecasis to pass between them. The surface of the country now becomes uneven, and although not remarkable for fertility, supports a tolerable growth of cedar and spruce. From Lyon's on the Kennebecasis to Hammond River, the conglomerate form the hills on both banks of the former. A few good farms were observed on the road, notwithstanding the soil is much inferior to the marley covering of the new red sandstone. Viewed from a hill not far from Hammond River Bridge, there is a pretty landscape, on the side of the Kennebecasis, there is a singular opening through the hill resembling a rude gateway - through this opening the farms and cottages of a small village are seen in the distance, like the 8 furniture to a house when its door is unclosed. About six miles from the city of St. John, on the road to Hammond River, the primary rocks of the chain of high land already noticed, cross the road; after having formed a series of elevated peaks, and high table land. The granite extends in a southwest direction to the Nerepis, where it is equally remarkable for its mountainous character, and sublime scenery. This formation at the spot where it is examined, is about two miles wide, but from the appearance of the mountains at a distance it evidently often extended to the distance of ten or fifteen miles in breadth. The surface above the granite near the road is low, and the turnpike has been made over boulders of that rock, these appear white from having been exposed to the weather, and fires which have occasionally overrun this portion of the country. Connected with the granite I also observed a good syenite in which the crystals of hornblende and feldspar bear very equal proportions to each other; and both rocks would supply materials for building - the Romans used syenite - both in building and architecture. Several specimens of late and epidote were procured in a fissure of that rock, which at another place was found incrustedwith the green carbonate of copper. A circumstance of much importance, and one which I hope my time on some future occasion will allow me to examine more carefully. These rocks are immediately succeeded on their south-east side by an extensive formation of primary limestone that extends in a south-west direction along the high lands northward of St. John, across the river near the Indian House, until it reaches Musquash, where it is quarried for marble. The boundaries of this most useful formation are unexplored, and but little is known of its real value and interesting minerals it contains. I have never seen limestone more highly crystallized than this, where it approaches the plutonic rocks thus mentioned. At several places where it is in contact with the granite, the marble is extremely compact, sonorous, and composed of crystals highly splendant, and white as the snow that in winter mantles the hills. Receding from the crystalline rock, the limestone becomes less and less granular and compact, until it passes by insensible shades into the transition variety, in which scarcely a solitary crystal can be perceived. These circumstances afford strong evidence in favor of the hypothesis that many older deposits of limestone have been converted into crystalline marble, by the heat applied under great pressure which accompanied the eruption of granite mountain masses from beneath. The effects then produced on the superimposed strata differ widely from those exhibited in the secondary and tertiary strata, where different chemical combinations and great pressure without the aid of volcanic agency have effected consolidation, but were incapable of producing those 9 vitreous and regular forms found in the lower rocks. It is true, that to produce crystals of carbonate of lime by artificial means, defies the skill of the chemist, but how imperfect are his manipulations, and how inadequate are his apparatus, when compared with the vast laboratory of nature, from whence whole mountains are raised in a single night, or whole continents descend into the places provided for their reception. Whatever may have been the original sources from which this limestone has been derived, it is impossible to infer that it was produced by the decomposition of older rocks, as it bears no analogy with the formations placed beneath it. Nor is it probable as some have supposed, that all calcareous strata have their common origin in the exuvia and remains of testaceous animals. It seems more rational to suppose that the lime now forming so large a portion of the earth's crust, had an origin from the hand of nature, and has only been accumulating through the medium of water or by extensive tribes of submarine creatures to which it is indispensible to form their shelly tenements. It is also necessary for the support of the vegetable kingdom, and the large quantity entering into the bones of man and other animals, naturally leads us to the conclusion that its abundance in another instance of design and wisdom of one Great Benefactor. Several varieties of marble were found in this district, some of which will vie in beauty with any ever discovered in foreign countries. Among them is a pure white with green veins, resembling the Carrara marble. At one place green serpentine was observed penetrating the calcareous rock forming the perfect Verde Antico of the Italians. Buccia marble and other varieties might be procured and may be readily distinguished even on the surface by the practiced eye. These beautiful and valuable materials for buildings and statuary, will not remain many years in their present useless state - they will soon supply the demand of foreign markets, and enter into more general use throughout the Province. The country at this place has the peculiar uneven aspect of lime districts. I wandered far from the road in the hopes of finding the entrance to some Cave, where perchance the bones of the fossil mastodon and hyena might be found in one common receptacle but disappointment followed, although such a discovery may reward the toil of a future visit. The soil, wherever the rain has permitted it to remain on the rocks, is almost sterile in consequence of being surcharged with the carbonate of lime. Those who cultivate any part of it will do well to mix it with fine sand to neutralize its caustic properties. Approaching the city of Saint John, from the eastward, the transition limestone disappears, and graywacke slate, and slate, succeed it, forming the hard and substantial basis on which the town is built. And it is singular that the capital of Nova Scotia and this its 10 rival town should repose on rocks of the same kind. At St. John, the strata also run north and southwest at some places they are almost vertical, at others they dip in opposite directions; these circumstances and the fractured state of the rocks, shew how much they have been disturbed since they were originally formed. The slate contains a considerable quantity of sulphuret of iron, and often find scales of mica, the latter giving the rock a peculiar glistening appearance. The town is built on a very uneven surface, and in order to overcome this difficulty large sums of money have been expended in making level streets, which show that its active and industrious inhabitants, amidst their commercial engagements, and various objects of enterprise, are daily rendering the city more cleanly, healthy, and comfortable, while its local situation cannot fail to render it in time one of the most important ports in America. The limestone is predominant at a village called the Indian House, situate on the River St. John, and about a mile above its entrance. This is the starting post for steam boats on the river and a kind of storehouse for the vast quantities of lumber floated down the watery turnpike of the Province. The Falls just below the village, at low water, afford a wild and sublime spectacle. The accumulated waters of the extensive and deep river, with all its lakes and tributary branches, are here dashed through a narrow opening, and over a rudely inclined plain towards the sea. Interrupted by small Islands above, and compelled to pass over huge masses of rock, obstructing a passage less than a quarter of a mile wide, the river foaming and spouting with tremendous fury, seems to assume at making its exit a most tragical character, threatening with instant death any who may venture upon its troubled bosom. But, at half-tide the scene is changed; the ocean spreads its mantle over the thundering cataract, and flowing inwards through the narrow chasm, stills the noisy rapid, and apparently to oblige the inhabitants, allows them to pass even with large ships in safety. On the east side of the falls a perpendicular wall of limestone, a hundred feet high, offers resistance to the violence of the stream, but as the current is directed on this side, it is ever crumbling down, and the river is gradually making for itself a wider and easier passage to the sea. On the opposite shore the rock is principally greywacke which makes a kind of peninsula stretching into the river and forming a considerable ""cove"" above the dangerous rapid. The ingenuity of man ever awake is about to render this local peculiarity profitable. The ""Saint John Mills and Canal Company"" have expended a large sum in opening canal across this narrow neck of land whereby they will direct a sufficient 11 quantity of water from above the falls into an expensive dam built below them and obtain immense power. The work is intended to propel twenty-four saws, and is rapidly advancing towards completion. It is the most extensive establishment of the kind in the Province, and reflects great credit on J.D. Emery, Esquire, the Agent, and the Engineer, who are engaged in its construction. From the falls to Grand Bay, four miles distant, the river passes through a deep narrow and tortuous channel, opened through hills of marble and transition limestone. I was surprised to observe that the continued action of the current, frost, drifting ice and timber has produced so little effect in forming sloping banks upon its sides, which are scarcely indented, but dip in straight lines beneath the water. When the absence of these effects, the narrow and remarkable outlet of the river, with its foaming cascade are considered, it appears probable that this site is by no means the original outlet of the Saint John, but one which has been reproduced from some geological catastrophe of which the rocks themselves bear the most unequivocal testimony. From what has already been observed I am induced to believe that the waters of this extensive river now escape into the ocean through an unnatural channel, and that its former bed was filled up by the same change in the level of the country that opened the new and extraordinary fissure through which it now passes. And I doubt not the

N.B. Courier - Sep. 30, 1837 LETTER III. To His Excellency Major General Sir John Harvey, K.C.H. and C.B., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency: Resuming the subject of my last letter, and the route from Petitcodiac River along the main road to Saint John,I found the road after leaving Holstead's Inn, to pass over a considerable hill called the Portage. The rocks of this hill are sandstone of the coal measures; and among them fossil Cacta Calamide and impressions of leaves are visible where the strata appear at the surface, which in general is covered with a meagre soil. The Portage is four miles long, and although narrow and uneven, is very pleasing on account of the pretty grooves on each side, and the thick clusters of birch and maple like festoons overhanging the way. From this place the waters of the Petitcodiac find their way into Chignecto channel; while those of the Kennebecasis take an opposite direction and escape into the River St. John. This elevation seems like a barrier set up between the two streams, notwithstanding some of their ultimate branches meet each other. Sussex Vale or Pleasant Valley (names applied tothe same place by many persons) is twenty miles in length, and averages perhaps, from one to two miles in breadth. Its course is nearly southwest, and it extends from the Portage to Lyon's Inn at the mouth of the Mill Stream. The hills on each side are of grey sandstone and conglomerate which not only affords a shelter from cold winds, but reflect much heat upon the lower grounds between them. New red sandstone occupies the principlepart of the valley. This rock is, however, covered at atmany points with beds of clay, sand, and gravel.Southward there is a tract of mountainous country evidently connected with the high lands already noticed, and like them is probably composed of primary and transition formations. A large salt spring flows from thered sandstone of Sussex Vale, which notwithstanding, it has been worked on a limited scale, has supplied considerable quantities of salt. There are similar springs a few miles northward, where the saliferous rock is accompanied with beds of gypsum and limestone, extending to Butternut Ridge. It is probable that a bed of rock salt might be discovered at this place, but its 7 distance from any navigable river, would render the transportation of the article too expensive to be profitable, and therefore the springs only possess the minor advantage of supplying the country near them. Almost the whole of Sussex Vale is in a state of agricultural improvement; the uplands are excellent, and the intervale affords abundant supplies of hay. Cultivated by an industrious population, the earth sends forth her richest rewards to the intelligent and active inhabitants. Near the Church there are some beautiful spots; the winding river with its intervale, studded with elms, and the deep valley skirted with snug farms, and embraced by a chain of hills, having here and there a lofty peak - the whitened cottage - the poplar-shaded mansion; all combine to strike the eye and prove the fertility of the district. After crossing the Bridge over the Kennebecasis at Roach's farm, the hill along the north side of the road is composed of conglomerate, which extends a number of miles without being covered with other deposits. This rock may be seen well at Lyon's farm, near Millstream bridge. It is of a coarse kind and composed principally of pebbles of quartz, firmly cemented together, argillaceous matter and oxide of iron. All the pebbles have been rounded and partially polished by attrition, and from the close resemblance they bear to pebbles found in the channels of rapid streams, or on the shores of the sea, in the absence of other causes producing similar effects, there can be little doubt, they have assumed their spherical figures from being rolled by the violence or after passing along the bed of some ancient river. The present compact texture of the rock has been produced by the nature of the cement, and the pressure it has sustained. Many curious enquiries might be instituted to ascertain from whence these pebbles came, but they would be attended with difficulty, and are foreign to my present purpose. At Mill Stream bridge the valley terminates, and the hills forming its sides approximate each other so nearly, that there is only sufficient room for the Kennebecasis to pass between them. The surface of the country now becomes uneven, and although not remarkable for fertility, supports a tolerable growth of cedar and spruce. From Lyon's on the Kennebecasis to Hammond River, the conglomerate form the hills on both banks of the former. A few good farms were observed on the road, notwithstanding the soil is much inferior to the marley covering of the new red sandstone. Viewed from a hill not far from Hammond River Bridge, there is a pretty landscape, on the side of the Kennebecasis, there is a singular opening through the hill resembling a rude gateway - through this opening the farms and cottages of a small village are seen in the distance, like the 8 furniture to a house when its door is unclosed. Miramichi Gleaner - Jun. 5, 1838 St. John Courier, May 26 Black Lead. - The black substance found in the limestone at Fort Howe Hill, has been recently analyzed by Doctor Gesner, who has discovered it to be plumbago or black lead. It is very abundant and of fair quality, and had been used by some persons for blacking shoes, stoves, &c. before its properties were fully known."

N.B. Courier - May 26, 1838 Black Lead. - The black substance found in the limestone at Fort Howe, has been recently analysed by Dr. Gesner, who has discovered it to be plumbago or black lead. It is very abundant and of fair quality, and had been used by some persons for blacking shoes, stoves, &c. before its properties were fully known."

N.B. Courier - Aug. 10, 1850 and Weekly Observer - Aug. 13, 1850 Black Lead. - Some time ago we noticed a specimen of Black Lead which had recently been discovered near the Falls. We have now to announce that forty-four cwt. of this valuable mineral has been shipped by Mr. E. Ketchum, of this City, for himself and the other parties interested, in the schooner 'Fairy', for Liverpool, as an experimental measure. We also learn that the quality is excellent and that they are about shipping a quantity to the United States, with the same view. We sincerely hope that their expectations may be realized, and that the discovery may prove a source of wealth both to themselves and to the province."
Headquarters - Aug. 14, 1850 Black Lead. - We have seen a sample of the Black Lead found in the neighborhood of Saint John, near the Falls, which has been forwarded for the inspection of Dr. Robb of this City. The article appears of a superior quality, and we believe can be procured from the mine in any quantity which may be required."

Morning News - Aug. 19, 1850 Black Lead Mines. - We paid two visits to the Mines near the Falls, last week - and saw the work of digging going on, also the lead, pure as it can be, in the side of the mountain. It is dug out as easily as if it were tallow, costing no further labor, than that of removing from the sides of the veins, the rocky substance. The lead runs in veins through the mountain - and these veins extend several miles in length, to say nothing of the depth below the surface of the earth, which must be very great. The Company have a miner superintending the work, who had wrought in the principal lead mines of England and South America - and he says he never saw better lead in his life than what he is now digging out at the rate of ten tons a day. A person well informed values this lead discovery to be equal to all the property in the City of St. John - and we do not doubt it - for we believe the lead to be inexhaustible. Call at our office and examine the specimens we took out ourselves just as it came to hand. The Company have received several orders already from the States for supplies. We saw a pile of the lead, say the bulk of a ton of coal, and did our utmost to discover slate or stone among it; but we could not find a bit the size of a pea in the whole heap - it was all pure soft lead."

Codes: L1 / IDX_Names: Saint John Graphite;
Morning News - Aug. 26, 1850 (To the Editor of the Morning News). - The Lead Mines. - Mr. Editor - Sir - Your paragraph in today's paper states the question fairly between my friend and myself on the advantages of this discovery; and as I contended that the more labor it took to produce the mineral the greater the advantage it would be to the country, I will briefly state my reasons, leaving my opponent to state his if he thinks proper. I maintain that the greater advantage consists in the distribution of the benefits among the larger number, and that this advantage is only realized in proportion as the cost of the labor of producing approaches nearer the value of the article produced. 8 Assuming that the lead will net œ20 per ton on the spot, if it costs œ10 per ton to mine it, I argue that it is better for the country than if the labour of producing it was but œ1 per ton. As in both cases the proceeds are divided between the labourer and the proprietors. If the labour of one man will produce one ton of the metal in a day, then the proceeds must be divided between him and the company alone, he being paid only a fair remuneration for his labour, and the company retaining all the rest; but it requires the labor of ten men to produce that quantity, then nine persons more are benefitted by it than in the former case, and if it cost nine-tenths of the value of the lead to produce it by the same rule, the benefits to the country would be greater. As even in the last case a sufficient profit would remain to the company to warrant them in pursuing the business. I maintain that the more labour that it requires so long as it is remunerative to the company at all, the better it is for the country, by distributing the benefits more equally between the proprietor and the producer. If the labour is small, the demand for labourers must be consequently small, and the profits must accumulate in the hands of the few; if the labour is large, the demand for labourers will be large - employment is given to the many, and the benefits of the discovery are distributed on a larger scale. I maintain that the wider distribution of the benefits is the greatest advantage to the country. One of the Polemists."

Morning News - Aug. 30, 1850 The Question at Issue Respecting The Black Lead Mines. - We published, on Monday, a letter of correspondence from a friend, who adopts as his premise that the Black Lead Mine recently discovered near the Falls, is of less value to the country than it would be, if the article were more difficult to obtain, and required more labourers to get it out. He says - ""Assuming that the lead will net œ20 per ton on the spot, if it costs œ10 per ton to mine it, I argue that it is better for the country than if the labour of producing it was but œ1 per ton."" To this doctrine we must utter our protest. - Our view of the case is entirely the opposite. - The value of an article to a country is not in the labour it costs to produce it, so much as in the quality and intrinsic value of the article itself. - If the earth teems with riches, whether in a good soil, minerals, or anything else, the value to the country that produces them is reckoned by the prices obtained abroad - and if one country is obliged to employ twenty men to work out a ton of lead, and another country only five men, why certainly the advantages are in favour of the latter - inasmuch as the article must be of better quality, and more valuable on that account, and brings more money into the country at a less expenditure of labour. Our correspondent, however, thinks that if the lead at the falls were more spurious, or difficult to be had, there would have to be more men employed - hence the advantage to these men, and indirectly to the country. To superficial observers this may seem all plausible enough. But let us examine the 11 matter. If it cost the Lead Company, according to our correspondent's reasoning, œ10 to raise the lead, they could not afford to compete in distant markets with a Company - say in Cornwall - who could produce the article at œ1. There would be œ9 to œ1 against them. Apply this rule to any other branch of business, and common sense will soon settle the question in your mind. If, for example, one tailor in making a coat could take two stitches at a time, surely he would have an advantage over the one who plied his fingers in the usual way. The facility of acquisition is the great auriferous principle that carries the day in the commercial transactions of the world. Take another example - suppose there were a gold mine near the Falls - and perhaps there is; there seems to be a little of everything there although our fathers have been sleeping upon - which would give employment to fifty men - and suppose also that in the vicinity of this mine there were barrels of doubloons already manufactured, which, of course, would forestall all this labour of fifty men, we ask which would be of the most value to the country for export, the gold in its crude state, or that already made up into doubloons? Surely the doubloons would carry the day - because before the gold could be taken out of the mine, smelted and manufactured, it would be considerably reduced in value, and the exporter would not have such profitable returns as the one who could send the article away without all this formula. Again, suppose one man has a farm full of rocks and stubble, and requires the labour of twenty men to clear and manure it; and another man has a more arable soil, which three hands can keep under cultivation, surely the farm which produces the easiest crop is of the greatest value to the country - Take another example. The manufactures of England were never so extensive and valuable to her as at the present day. She can afford to compete with the whole world, in spite of opposing tariffs. The steam engine has been the means of doing all this, and what is the steam engine guilty of? Why throwing out of employment in the manufacturing districts millions of hands that would have to be at work there if this machine had not been discovered. Now we do not mean to say there are millions of labourers idle in England on account of the engine - No; they are employed at other branches of business created by means of the engine. It is the facility, and not the mere manual labour, of producing English fabrics, that makes England great and wealthy. The same precisely with our Lead Mines. If by a simple process we can furnish lead in abundance, from a source as prolific as a fountain, and can find sale for it abroad, the country is enriched upon the same principle that England is, by means of her engines, though there be not three men to perform the labour. - We now come to the clinching part of the subject. In what way - we are asked - is the country benefitted, 12according to our view, if only a few men obtain all the wealth, from abroad, while the labourer at home is kept at a distance and unable to get employment at the mines. We answer, the money is brought into the country - it passes from the hands of the miners into the hands of the blacksmith, the shoemaker, and others. The miser introduces a circulating medium. As a general rule when men or companies of men, make money easy, they spend it freely - so that if the labourer does not find himself working in the lead mines up to his eyes in smut, he finds employment at other things, created, in an indirect manner, through the money brought into the country by the owners of

N.B. Courier - Jul. 13, 1850 Black Lead. - A specimen of black lead is nowlying at the News Room, which was found near the Falls of the River St. John. We understand it is thought to be of good quality. It appears as if there was no want of minerals in our Province."

Codes: L1 / IDX_Names: Saint John Graphite;
Nova Scotian - Jul. 22, 1850 Black Lead. - A specimen of Black Lead is now lying at the News Room, which was found near the Falls of the River St. John. - We understand it is thought to be of a good quality. - Cour."
St. Andrews Standard - Jun. 12, 1850 We have in our possession a specimen of Black Lead found in the vicinity of this City. It is of superior description, and arrangements are being made to commence operations for digging without delay. We have no doubt it will prove a profitable investment.- New Bruns."

N.B. Courier - Sep. 7, 1850 and Head Quarters - Sep. 11, 1850 and Carleton Sentinel - Sep. 17, 1850 BLACK LEAD MINES. - The prospects of the St. John Mining Company still continue extremely encouraging, as the article has been examined by a great many persons who pronounce it of excellent quality. There are seven persons now employed in extracting it from the vein, which is simply done with a pick and hammer, after which it is examined, the refuse laid aside, the first and 13 second quality separated, and then barrelled up and sent down to the City through the Falls in a boat or scow. They are now producing as much as forty barrels per day, and during the four weeks that they have been in active operation, they have procured over 900 barrels - viz., four hundred of the first quality, and five the second. It is supposed by some persons that it will realize about œ2 per barrel, and should this supposition prove correct, and the quality of the article suit the British or American markets, there is little doubt but that the fortunate individuals who compose the company (which is divided into 6 shares) will in a short time be in the possession of handsome incomes from the undertaking. The only thing that we can see to prevent it turning out a very lucrative speculation, will be the want of a sufficient market for such large quantities as can be taken from the veins, as the celebrated Borrowdale mines in England are only opened at limited and stated periods on this account, to prevent the markets from being overstocked. The St. John Mining Company has secured the right and privilege from Government to carry on their operations for twenty five years, to the extent of three square miles in that locality, on the usual terms of paying to the Government an upset preference price of œ5 per square mile, and 5 per cent. on the produce. We learn, as alluded to by us some weeks ago, that lead ore has been discovered by some parties on the Company's ground, and that an offer has been made by the said parties to point it out on condition of receiving a share of the concern, no arrangement has, however, been concluded yet on this point. The veins which the Company are working at present are on the face of the rock running East and West, quite low down, almost to the water's edge, situated on the eastern side of the river at the Falls, immediately above Split Rock, and in order to reach them parties generally take the Indiantown road, turn in by the Catholic Church ground, through the bushes, till they reach the top of the precipice, and then, with the assistance of a rope and ladder, let themselves down a somewhat perilous descent. In the event of this undertaking succeeding it cannot fail to be of great importance to the community, on account of the money it will bring to the place. We therefore wish our fortunate friends every success in their speculation. Our prospects, altogether, are quite cheering now, - with Railroads - increasing remuneration for lumber, our staple of export, - and Black Lead, - this Province, we think, is bound to go ahead sooner or St. Andrews Standard - Sep. 11, 1850 The Black Lead Mines at St. John, we learn, are not only productive, but the lead has been pronounced of an excellent quality. The prospects of the Company are very encouraging; - they have only been four weeks in operation, and have obtained four hundred barrels of the first and five hundred barrels of the second quality. The daily average procured is about forty barrels, which, it is supposed, will be worth œ2 per barrel."

Novascotian - Sep. 16, 1850 The St. John Mining Company's prospects with regard to the Black Lead Mines, appear to be very encouraging - seven persons procure forty barrels per day - and it is thought that, provided the article finds favor in England and the United States, the sum of œ2 per barrel will be realized. The Company have secured an exclusive privilege from Government of twenty-five years."

Morning News - Dec. 5, 1851 The Black Lead Mines. - We are gratified to learn that the New Brunswick Mining Company have taken from their mines, near the Falls, upwards of 2,400 brls. black lead, or plumbago, since they commenced operations last year, and that most of it has been disposed of. The company have had to contend with great difficulties. The quality of the article at first, owing, we presume, to its being so near the surface of the earth, was not sufficiently good to command the favorable attention of persons abroad; and had not the company been composed of a few men of great enterprise and public spirit, they would have long since abandoned the speculation as worthless. But they persevered, spent money, and pushed further into the bowels of the earth, until at length they have got under ground 200 feet. The lead has improved with their progress; the quality now is said to be most excellent, and the Company feel greatly encouraged with their luck. When it is taken into account that the lead mines in England are thousands of feet under ground, we have a right to believe that since our company have succeeded so well with the progress of 200 feet, by the time that distance is doubled, it will be found that St. John will turn out as pure and excellent plumbago, as any to be had in the world."

Codes: L1 / IDX_Names: Saint John Graphite;
Morning News - Sep. 23, 1857 The Blast at Lawlor's Lake. - Mr. Editor:- It having been stated in the city papers that Mr. Myers, the Railway Contractor at Lawlor's Lake, had engaged me to construct a galvanic battery, which was got up at great expense, with the view of simultaneously igniting twenty of the large blasting chambers that had been drilled in the rock, south-east of the lake; and that the experiment proved a failure from the batteries not having sufficient force. My name having been thus coupled with the cause of the failure, I beg through your medium to correct some of the statements which have been made, as I think, gratuitously, or from misapprehension, and to point out the casualty that was the immediate source of disappointment with regard to the battery explosion; and in doing so, I hope to be excused for offering the following account of the matter. Mr. Myers applied to me, requesting to know if I could construct a galvanic battery at short notice, capable of igniting simultaneously twenty charged blasting chambers, and if I would undertake the direction of its application. I told him candidly that I had no practical experience in such operations, but I saw no difficulty in the way except the want of time and materials to get up an extensive enough apparatus, capable of generating and transmitting through the necessary length of circuit, a sufficient quantity of the voltaic current to ignite the number of secondary wires, requisite in to connect the priming portions of it. But I thought I could construct in a temporary way, in a few days, a battery in aid of this I could obtain at the Mechanic's Institute, that would effect the object in view. I admitted there was much risk as to success, from the number of secondary wires in the circuit requiring a very energetic battery action; but should he risk the experiment, and it prove a failure, I agreed to give my personal services gratuitously. Mr. Myers having resolved to make the trial, of this to him novel method of blasting, I set about directing the construction of two calorimeters, each having 30 surface feet of zinc presented to a like double surface of copper, arranged as two elements in one cell, which consisted of a pine box, well coated inside with Brunswick stove varnish. These two calorimeters formed the central arrangement, and in order to give electrical intensity to the current, the four batteries of the Mechanic's Institute, consisting of 56 pair of 4 1/2 inch plates, arranged on the plan of Woodward, were connected to the opposite poles of the calorimeters. The batteries were placed about 25 feet from the line of blasting chambers, and distant from each extreme about 100 feet. The whole length of the circuit was about 1,000 feet, 800 of which consisted of insulated copper wire, to which was attached, to make up the circuit, sheet lead cut into strips, and varnished with a sealing wax solution. The 5 priming wires were each connected for ignition with a piece of steel watch hair-spring, and each inserted into a small bag, containing fine powder, and placed in the blasting charge, which was enclosed in a greased canvass bag. On the blasting chambers being cleared of water, the cartridges inserted, tamped, and the necessary connections soldered, Mr. Clinch of the Telegraph Office, who kindly, at my request, applied the Relay magnet, to test by telegraphy the completeness of the metallic circuit, when it was found to be broken in several of the chambers. After some delay, and several trials, a feeble magnetic action began to manifest itself in all, except two of the chambers, when attachments were made, so as to leave those out of the circuit. It now being nearly dark there was no time for making other arrangements, so it was resolved to test the action of the batteries. These failed to ignite the powder, as has been stated, and so would any other batteries under like circumstances, not from want of ""sufficient force"", but from the want of metallic connection in the circuit, which had been broken, as the application of the Relay magnet proved when first applied and when the powder was dry. The feeble magnetic action (a circumstance I have since proved by actual experiment to take place). There was, therefore, no proof that the battery ""failed in doing its work""; but rather that in a matter that requires so much nicety of adjustment, sufficient caution was not used in the placements - the connection should have been more carefully handled than was the case. Had the circuit in its metallic content proved complete, and the battery arrangement failed, from the want of ""sufficient force"", the circuit might then have been reduced to its igniting power, the experiment then would have been fairly made, and some practical information gained. As it was, the lateness of the hour and darkness, precluded further trial; and as the water was rising rapidly in the chambers, I advised the firing to take place in the ordinary manner, as I had recommended that a fuse should be inserted along with the priming wires into each cartridge. I am happy to find that the blasts at the southern portion did so much good service to the spirited contractor, who has my best wishes. I am sorry that I have not been instrumental in bringing about a more fortunate issue to a good intention. The loss of money by the failure of the experiment, will, I hope, be but trifling; it will be mostly confined to the loss of the priming wires and the powder not yet exploded. The calorimeters are, I think, worth all they cost, and I hope they may prove so on some future more successful experiment. I have to apologize to Mr. Fenety for occupying so much of your valuable space, but the public having expressed great interest in this matter, I have thought it proper to offer for their information the foregoing 6 statements. Your most obd't R. Foulis St. John, Sept. 18th, 1857"

Morning News - Aug. 20, 1862 Lead Mine. - We notice that the schr. Anna sailed for New York on Monday night with ""black lead"". This lead (several hundred tons) is the result of mining operations which have been going forward lately near the Suspension Bridge, under the superintendance of a Mr. Connell, who is agent for the firm of C. & J. Seabury, extensive manufacturers of black lead in New York city. A quantity of this mineral was sent to the States some time ago, and was found to answer well for certain manufacturing purposes."

S.J. Daily News - Jun. 4, 1865 BLACKLEAD MINING. - A German resident of New York discovered not long since a Black lead Mine in the property adjoining the residences of Messrs. Roberts, Suspension Bridge Road, obtained a lease of the ground, secured a mining license, and is now operating successfully. The material, which is apparently very good, is used by the gentleman working the mine for manufacturing purposes of some kind in New York, and in this way he is realizing a good thing out of it."

Daily Telegraph - Sep. 2, 1865 The lead mine on the Suspension Bridge road, adjoining Messrs. Roberts' property, is being successfully worked. Mr. Correll, the proprietor, has shipped to the States in the last two weeks 526 bbls. Of the material. It is used extensively for ""black leading"" stoves, and in place of sand in moulding in foundries. Specimens of coal have been found on the land. It is a very bright coal. Some that we have seen looks like anthracite; other pieces appear highly bituminous."

Morning Journal - Dec. 18, 1868 ADVERTISEMENT: Split Rock Plumbago Mines. These mines are now fully opened and actively producing the finest quality of Crude Plumbago. Orders for either large or small quantities can be filled immediately. T.G. Bourne, Agent. 12 Nelson Street, St, John, N.B."

Morning Journal - Nov. 6, 1868 Plumbago Mining at The Suspension Bridge. - Many of our readers are familiar with the bright print representing a coloured boy holding a cat to look at herself in the polished side of a stove, and frightened at her own reflection, struggling to get free. If they read the advertisement they will see that it is Corell's Stove Polish, imported from New York. Few perhaps may know that it is first shipped from our City in an unprepared state ere it takes the bright round form of the celebrated ""Stove Polish"". There is on the left hand side of the road as you proceed to the Suspension Bridge, just past the residence of Mr. T.B. Barker, a low black building. Sometimes one or two men with blackened clothes and polished hands or faces may be seen rolling out side of it barrels black as themselves. Just behind that building is the shaft of a mine eighty feet in depth. Leaning over the slim railings around it you can see to the bottom and can hear the men working below. Take care or while you gaze you may be covered with inky mire thrown up by the horse which hoists the tub, or your hat and perhaps your head may be knocked off by the rope swinging from one side to the other. Be mindful lest you slip down or the outer man be so blackened and polished that it will be fortunate if some cat or dog do not run away from you having been frightened at seeing himself reflected on your sides. Taking the precautions we have mentioned you may walk about the Plumbago Mine and inspect its working. The method of raising the black lead to the surface is very simple and the whole arrangement has been put up at little cost. The product of the mine, however, is most valuable. The Superintendent, a very courteous young man, gave us a little information which surprised us, as we had not believed the mine to be so rich. They have raised about 900 barrels to the surface during the thirteen weeks, and 2,000 from its first commencement two year ago. Each barrel contains about 300 lbs. In its crude state it is sold to the foundries at fifteen cents per pound. The rest is sent to New York and by a simple preparation becomes much more valuable. There is very little dross among that which comes up from the mine; the impure matter can easily be picked out. The cost of working is very small, say $35 per week, a mere nothing compared with the profits. It seems that Mr. Corell was a travelling agent for a Black Lead Company, and when on his rounds several years ago he called at Saint John. - Somehow he had an inkling about there being a vein of blacklead in the spot we have mentioned. He kept his information to himself, but as soon as he could raise money enough he bought the place which has since proved so profitable. Having worked it for some time, he has since associated others with himself, but retains a large share and the position of manager to the Company. He makes one or two visits a year to the mine, for doing which, and transacting the other business of the Company he receives a most munificent salary. Mr. Corell is a German by birth and is said to have left his fatherland at an early age and with small means, to seek a position in the world. He had evidently the faculty of going about with his eyes open, and this is always a fortune in itself. The mine is not inexhaustible, but there is as much more blacklead yet to be obtained. They ar not about to work it this winter, probably because they do not wish to glut the market and bring down the price. It cannot be because of the difficulty of working it in winter because that could be easily obviated by erecting a shed over the mouth of the pit. We learn that another mine is about to be opened near the Suspension Bridge. The gentleman who is moving in the matter has been connected with other operations in St. John, including the shipment of ice to Southern ports. It is said that he has made arrangements for shipping the mineral in a crude state to several Canadian ports and disposing of it in local markets. It is pleasing to hear of these attempts to develop our mineral wealth. They are probably only the precursors of much more extensive operations."

Daily Telegraph - Nov. 22, 1869 Blacklead Manufactory. - The Split Rock Plumbago Mine is becoming a very remunerative concern, and, at present time, gives employment to twenty hands, who are working steadily and will continue to do so through the winter. When the mineral was first brought to test it was pronounced of an inferior quality. Mr. A.D. Garrett, of Kentucky, expended a considerable sum in working the mine, but had almost to suspend operations on account of meeting with no encouragement from any of our merchants or capitalists, until Mr. C.L. Richards became interested and sent the article to Messrs. Coleman & Co., of London, who pronounced it useless for the manufacture of stove polish, though it had been used for foundry facings. As they were large exporters of stove blacking to the Provinces, it was thought their opinion might have been biased by their interests, and a commission merchant of London was next applied to. He has offered them a market for both the lead and polish at prices which are highly remunerative. Messrs. C.L. Richards and Flint, Dearborn & Co., have started a mill under the name of the ""St. John Blacklead Works"", and they can turn out five tons of stove polish a day. The article manufactured by them is said to be of a superior quality, and imparts a black gloss or polish instead of the dull leaden shade of Coleman's and Nixey's blacking. The mill is located next door to Flint, Dearborn & Co.'s Spice Works, and the machinery is driven by power supplied from their engine. The polish made can be put into the market ten per cent. cheaper than Coleman's or Nixey's, and being as good an article, if not better, it must shut all others out. We wish the proprietors of the new enterprise every success, and recommend the article manufactured at the ""St. John Blacklead Works"" to a test by the public."

Codes: L1 / IDX_Names: Saint John Graphite;
Daily Telegraph - Nov. 29, 1869 Samples of Plumbago. - We have received through Mr. C.L. Richards, samples of the Plumbago, which is being mined near the Suspension Bridge. These represent the mineral both in its natural state and when
ground. It is impossible to imagine anything purer or more valuable - of its kind, - than the specimens show it to be. This paragraph is written for the printer with a piece of the mineral in its rough state."

S.J. Daily News - Dec. 5, 1882 The Botsford Graphite Mine, at the Falls, has suspended operations. The manager, however, has one hundred and twenty tons of the ore raised to the surface which he will sell in Boston and Philadelphia, where a paying market is being developed."

Daily Telegraph - Jul. 7, 1882 Drowned in the Shaft of a Mine. - Near Fairville there is located a lead mine that has been worked for some time. It is a short distance from Long & Barnhill's mill and is owned by Mr. Murray. A shaft has been sunk to the depth of 50 feet and the bottom of this, for nearly 20 feet, is filled with water. Yesterday afternoon about five o'clock, while some workmen were engaged at the mouth of the shaft, Edward McAfee, of Sheriff street, Portland, one of them, was seized with a fit and fell backward into the shaft. When he had descended some 12 feet his head struck a bucket that was suspended at that distance, and he fell into the water. Before assistance reached him he was drowned. The body was brought to his late home and an inquest is to be held."

Moncton Daily Times - Jul. 8, 1882 A shocking accident occurred Thursday afternoon at the black lead mine, above the Fall at St. John by which a man named Ed. McAfee, 26 years of age, who lived in Portland, met his death. While standing near the shaft he took a fit, fell down it a distance of 30 feet. In the descent he struck a hoisting tab and then fell into the water at the bottom, in which he soon drowned. His body was got out and taken to his parents' house where an inquest

S.J. Globe - Jul. 8, 1882 The Portland Coroner's jury returned a verdict of accidental death in the case of Edward McAfee, who was killed by falling down the shaft of the black lead mine above the Falls."

Daily News - Oct. 13, 1882 Graphite. - The Botsford graphite mine near Murray's is now sunk to a depth of 55 feet below the surface. As the workmen proceed the quality of the ore improves and Mr. Botsford is now negotiating with parties in Boston to secure a permanent and profitable market for his ore of which he has now about 100 tons raised from the mine. Quite a trade has been carried on with local foundries, &c., but when a market is established in Boston the producing power of the mine will be developed to double the present capacity."

Daily Telegraph - Oct. 16, 1882 and N.B. Reporter - Oct. 18, 1881Mr. Botsford's Graphite Mine. - This mine, situated near the Suspension Bridge, is now being worked on a small scale. There are probably a hundred tons of material on the spot, which is comparatively pure. It would be easy to write with samples that are before us. The veins are large and if, as is usual, they improve as they descend, the property must be very valuable, graphite being a rare mineral for which their is an inexhaustible demand. The vein runs NE by SE and dips to the SE. It has been opened to a depth of 50 feet. It is a property which ought to be fully tested and developed."

Chignecto Post - Aug. 23, 1883 and S.J. Globe - Aug. 24, 1883 and Fredericton Capital - Aug. 25, 1883 Valuable Mineral.- Mr. Geo. Botsford, ofFredericton, two years ago prospected his property above the falls on St. John River, for plumbago. He sank a shaft some 40 feet., and found a large vein from which he has taken over 100 tons. Samples of it were tested here last week by the Colonial and Sackville Foundries, and found to rival Clark's foundry facings."

Daily News - Feb. 7, 1883 Shipments. - Mr. Botsford shipped a carload of graphite from his mine near the Suspension Bridge, to Montreal, a few days ago."

Daily Telegraph - May 30, 1883 The Plumbago Mine at the Falls. - The plumbago mine of Mr. George Botsford, near the

Suspension Bridge, was recently visited by our reporter. Mr. Botsford commenced work here some three years ago; he has sunk a shaft to the depth of seventy feet, coming upon a vein of pure plumbago, eighteen feet thick and of a width which was unascertained. Employing twelve men, Mr. Botsford is able to put on the market about 75 barrels of the mineral per week realizing for the same a very remunerative price. Plumbago is used for foundry facings and fire proof paint. All of the products of the mine are disposed of in Boston."

Fredericton Capital - May 31, 1883 Mr. Botsford's Plumbago Mine.- Yesterday's Telegraph contained the following item concerning the Fire Clay and Plumbago Mine, operated by Mr. Geo. Botsford of this city, near the Falls at the mouth of the St. John River: The plumbago mine of Mr. George Botsford, near the Suspension Bridge, was recently visited by our reporter. Mr. Botsford commenced work here some three years ago; he has sunk a shaft to a depth of seventy feet, coming upon a vein of pure plumbago, eighteen feet thick and of a width which is unascertained. Employing twelve men, Mr. Botsford is able to put on the market about 75 barrels of the mineral per week, realizing for the same a very remunerative price. Plumbago is used for foundry facings and fire proof paint. All of the products of the mine are disposed of in Boston. The working of this mine is under the management of Mr. Harry G. Botsford, who has proved

Codes: L1 / IDX_Names: Saint John Graphite;
Daily Telegraph - Nov. 15, 1883 The plumbago mine of Mr. Geo. Botsford, near the Suspension bridge, is being worked with a good deal of vigor and the daily output is much larger than any previous time."

Daily Telegraph - May 1, 1884 Shipping Graphite. - A carload of graphite taken from Mr. Geo. Botsford's mine near the Suspension Bridge, will be shipped by the New Brunswick Railway today."

S.J. Globe - Dec. 1, 1885 A Graphite Black Lead Mine. - Persons who have followed the bank of the St. John River for a short distance above the new cantilever bridge, on the Portland side, will have noticed a small building in a field, surrounded by heaps of rock and surmounted by a rathertall chimney. If they have inquired of any one living in the vicinity as to the purpose of this structure, they have probably been told that it is the black lead mine. Now the substance obtained from this mine is not a variety of lead. The name black lead is inappropriate, as it contains no lead, but a modified form of the element carbon. The various names, graphite, black lead, plumbago, designate a mineral substance similar in composition to ordinary coal but quite different in its properties. Graphite is found in the earth in seams of the rock - in beds, pockets, and in large masses imbedded in granite gneiss and limestone. It is probably in most cases a result of the alteration, by heat, of coal, or coal-like substances. An artificial graphite is sometimes found in the flues of furnaces where coal is burned. At very high temperatures graphite burns without either a flame or smoke, having a slight residue which is chiefly oxyd of iron. In ordinary furnace heat and in the flame of a blowpipe graphite is not changed. Graphite varies in composition from the pure alibert graphite of the Ural Mountains, which contains 94 per cent of carbon to the graphite of Passan in Bavaria, which contains but 70 per cent of carbon. The graphite found at the Falls is equal to the latter. In some parts of Europe graphite is found in coal beds, which have had their character altered by the action of volcanic heat. Large masses of graphite have sometimes been found which retain the structure of the wood from which they have been formed. Graphite is used in the manufacture of the so- called black lead pencils, stove polish, as a lubricant for the preparation of fire-proof crucibles, as a facing for foundry castings, etc. Many years ago an impure variety of graphite was mined to some extent on the bank of the St. John river just below the falls. It was largely contaminated with shale and iron pyrites, and proved to be unsuitable for commercial purposes. The old workings were abandoned some time ago. A short time since Mr. Botsford, of Fredericton, undertook to sink a shaft on his land near the falls for the purpose of testing a variety of clay that he thought might prove valuable. After sinking the pit a few feet the supply of clay was exhausted, but the bottom of the seam in the rock contained graphite, which has continued to increase in quantity and quality ever since. Several hundred tons have been shipped to Chicago and other points west, and it is found to be equal if not superior to the graphite that was previously imported from Europe. Since the opening of the new bridge the facilities for shipment are improved, and it is probable that the new industry will shortly assume considerable proportions. Suitable pumping and hoisting machinery have lately been placed in position, and there is every reason to believe that with careful management the mine may be made a source of profit to the owners and an advantage to the

Aug. 1886 - Copied from: St. Croix Courier - Aug. 10, 1916 30 Years Ago. - A crew of eight men are mining black lead near the St. John falls."

Chignecto Post - Aug. 12, 1886 A Carleton (St. John) man has commenced shipping the first part of an order for 250 tons of black lead to a Cincinnati house."

S.J. Daily Sun - Jan. 22, 1887 The Plumbago Mine. - During the past two years S.S. Mayes, the lessee of the plumbago mine near the falls, has had about a dozen men employed there. Mr. Mayes has put in new machinery, which is worked by steam. About 700 tons of ore can be mined annually, and Mr. Mayes has got out a very large quantity. The ore is shipped principally to the United States, where there is a great demand for it. Sheds have been erected at the mine, in which a large quantity of the ore is stored. Mr. Mayes is prepared to supply the founders of Canada with this ore, which is

Daily Telegraph - Apr. 13, 1891 Plumbago Mine. - Messrs. Best and McLaughlin are engaged in developing the deposit of plumbago situated on the Hazen property, near Murray's mill. It is probable that quite extensive works will be erected, and improved machinery introduced for sorting and grinding the ore. This ore will be exported to the United States and England, where several contracts have already been secured."

Daily Telegraph - Aug. 27, 1891 New Mining Machinery. - It is the intention of the St. John Plumbago Mining Company to push operations, as a market for the product of the mines has been found in the United States and in Europe. Steam machinery, consisting of a boiler and engine, a winch, pumps and a ventilator, has recently been purchased; and is now being fitted up. The indications are that there is an abundant supply of the ore of good quality. The mine only requires development to become one of the important industries of the city. The buildings already erected and in course of construction are of a substantial character, and operations will be carried on all the year round. This property is about 300 yards south of Murray's mill, near the falls."

Codes: L1 / IDX_Names: Saint John Graphite;
Daily Telegraph - Nov. 4, 1891 Plumbago. - The managers of the plumbago mines are constantly receiving requests for

samples of ore from manufacturers in Great Britain. Recently sample barrels were shipped by the Furness line steamer to firms in Scotland and England. The steamer Winthrop took away on her last trip a small consignment for an Albany house. There has been considerable activity in the mines during the past few weeks, and as a result the sheds have been filled with the best quality of plumbago. It is the intention of the managers to continue operations during the winter if sufficient orders can be had to justify the employment of labor. Since May last seven men have been kept constantly employed. The men are now down a distance of 50 feet, and a level has been run 40 feet from the foot of the shaft. A letter recently received from Mr. James I. Fellows, agent general for New Brunswick, in London, states that prominent firms, who are large consumers of plumbago, express their willingness to test the New Brunswick article, and if

Weekly Record - Fri. Oct. 2, 1891 The St. John Plumbago Mining Company are making another shipment of the products of their mine to Cleveland, Ohio and Springfield, Mass. A short time ago a carload was sent as a sample and a test was so satisfactory that an order for two carloads followed. The mine is in the vicinity of the falls and is giving steady employment to several workmen."

Evening Gazette - Oct. 6, 1891 The St. John Plumbago Mine. - Several years ago some parties sunk an inclined shaft into the side of the cliffs, on the eastern side of the falls, a few hundred yards up river than the bridges, and mined plumbago there. The seam, however, ran rather too deep and on account, or because it became too small to pay, the mine was finally abandoned. In April of this year, however, another company was formed which set men to work to sink a shaft nearer Marble Cove than the former one and at a depth of 50 feet a seam of black lead, or plumbago, was reached, that was large enough to pay the company to operate the mine. The plumbago secured has been shipped by the company to Cleveland, Cincinnati, Springfield, Mass., and Montreal. Eight men are now employed at the mine and the business is increasing. The directors of the company are Messrs Morley McLaughlin, W.F. Best and L.J. Carney."
Chignecto Post - Oct. 8, 1891 The St. John Plumbago Mining Company are making another shipment of the products of their mine to Cleveland Ohio, and Springfield, Mass. The first carload sent as a sample tested so satisfactorily that an order for two carloads followed."

Daily Sun - Jul. 25, 1896 The Lead Industry. - The Canada Paint Company to Commence Operations Near the Falls. - Every city or town has some industry that is, as it were, effervescent, sometimes working in good shape and then like turbulent waters relaxing in its efforts and perhaps being altogether subdued. St. John is no exception, and probably the most prominent example of this up one day and down tomorrow state of affairs is the lead or graphite industry that has for the past generation or two been bubbling into prominence only a short time to be shut down. The sight of the operation have been principallyin the vicinity of the falls, although attempts to mine it have been made at Lily Lake and back of Fort Howe. But the scene of the most extended operations have been at the shaft sunk near Murray's mills. The purchase or lease of this property by the Canada Paint Co. of Montreal will probably mark a new era in the history of the industry here and consign the former operations to oblivion. To go back and speak generally this work was first commenced over forty years ago by Messrs. Harper & Maher, almost under what is now the Suspension bridge. Murray & Co. of New York took hold of the mine, only to give it up to a man named Correll. An American named Garnett next tried his luck. The scene of the operation shifted to the vicinity of Murray's mills and Mayes and Botsford controlled the business for aa time. This brings us up to a few years ago when McLaughlin and Best opened a new shaft only a few feet from the Botsford one. They did not last long, and now the thing assumes a more business aspect than ever before. At present all the shafts are full of water, but in a very few days the new operators will have machinery that is daily expected from Montreal put in place and then in operation. The sheds over the shaft have been put in repair, and it will not be long before the puff of the mine engine and the click of the pick will be added to the noise of the great saw mill only a few yards away. The Canada Paint company have on the market a graphite paint; the victorious yacht Glencairn was done with it, and in the manufacture of this article considerable lead of this kind is used. Previous operators always found a ready market in the United States for the lead, but it never was put on the market in proper shape. The last operators shipped it in bulk just as it came out of the shaft. It is understood that the new people will handle it properly. The seam that is to be operated is one of the best struck so far, the graphite being of a good quality and the seam a large one. The result of the recent change in operators will be watched with interest by all, but more particularly so by the older residents in that vicinity who have viewed its many ups and downs."

N.B. Reporter - Jul. 29, 1896 and St. Andrews Beacon - Jul. 30, 1896 The Canada Paint Company of Montreal has leased the graphite mine at the Falls, near Murray's mill, St. John, and will at once begin mining. They will use the mineral in making paint."

S.J. Star - Aug. 16, 1902 A fall of rock in the plumbago mines at the falls yesterday somewhat injured Walter Leland, one of the workmen, and he very narrowly escaped being crushed to death."

Kings County Record - May 2, 1902 Among the mining industries of the province which are coming to the front is the Diamond Graphite mines near the falls at St. John. Recently the Canada Paint Co. of Montreal, shipped a carload of the graphite from St. John to their works in Montreal. Last season five shipments were made. It is intended to sink another

Codes: L1 / IDX_Names: Saint John Graphite;
Evening Times-Globe - Sep. 18, 1948 Rediscovers Local Graphite Mine which he Started Work as a Lad. - The story of the old graphite mine, within the city limits, which produced thousands of tons of high grade ore for shipment from Saint John by rail and schooner, is told today in an interview with S. Herbert Mayes, 215 Winslow Street, West, who was engineer at this mine 60 years ago. Mr. Mayes is shown above [PHOTO in notes] pointing to an almost filled in shaft of the old mine, located in the lumber yards of Murray & Gregory Ltd., at the foot of a steep cliff immediately behind the new wing of the Saint John Vocational School. The old shaft has long since been filled in but the timbered sides near the top are still in a fairly good state of preservation. Sixty odd years ago Saint John was an important source of graphite and the mineral, in nearly pure form, was mined right within the city limits. Schooners docked a few hundred feet from the pit head to take full cargoes of ore to United States manufacturing centres along the Atlantic seaboard, while thousands of tons also were dispatched from Fairville by rail to Upper Canada. These interesting facts were recalled this week by S. Herbert Mayes, West Saint John, whose father Sam... and shipbuilder of his day, was the last operator of this mining adventure. S. Herbert Mayes, who later became associated with his father in business and who has played a prominent role in the community affairs of Saint John, worked as an engineer in this mine while still in his teens. He is believed to be the last living man actively associated with this phase of Saint John's industrial past. 'We received $7 per ton for the graphite, landed at the railway station at Fairville or at the wharves where the schooners docked to take cargoes of the mineral ranging up to 250 tons,' Mr. Mayes recalled as he consulted an old ledger. Judging from letters received from satisfied customers in the United States, Ontario and Quebec - letters which Mr. Mayes still has in his possession - the graphite taken from this mine was of high quality. This mine originally was owned and operated by the Botsford family,' said Mr. Mayes. Father became interested early in the eighties and a few years later took over the operation. The mine was in production until 1888 when new sources of the ore in the United States came on the market and outlets disappeared.' Mining ceased about 1889, he said. At peak production the mine was producing about 10 tons of graphite per day, and Mr. Mayes has estimated that many thousands of tons were shipped from Saint John to outside markets. With prices as they were in those days this netted a nice profit for the operators and brought good wages to the workers. The shaft of the mine is located at the foot of the steep cliff immediately behind the new wing of the Saint John Vocational School. The shaft has long since been filled in, except a few feet near the top where the timbered sides, still fairly well preserved, can be seen. The shaft went straight down 60 feet and was well timbered. At the foot of the shaft, a sloping tunnel about 500 feet long, extended in the direction of the river. The graphite was mined in this section of the property and trucked to the foot of the shaft. It was then raised in buckets operated by winches, to the top of the shaft. From there the ore was carted to Fairville, across the old suspension bridge, or in waiting ships docked at nearby wharves. 'It was quite a simple operation to look after the donkey engines which operated the bucket hoist and the pumps. Quite a lot of water seeped into the mine so the pumps were started early in the morning and kept going for several hours before digging and hoisting started. Occasionally, during the working day and for several hours each night, we also had to man the pumps to draw off the seepage. 'When father took over this mine I was too young to start work but I kept after him for a job and, in a year or so, I was given some light work after school and on Saturdays. I became greatly interested in the mine and pretty soon found myself operating the engines. It was fascinating work. 'Consequently we were all very sorry when mining operations ceased. With the expanse of Industry and the discovery of new and much larger fields of graphite which could be mined by large scale operations the price declined for our product and we were not able to meet competition.' Mr. Mayes said that he had not visited the old mine for many years but after reading a recent article in The Evening Times-Globe about the re-discovery of an old shaft near the Reversing Falls by Harry G. Botsford, jr., of Winthrop, Mass., he decided to become a prospector also. It was Mr. Botsford's grandfather who had been associated with Mr. Mayes' father in this mining operation at the foot of the cliff back of the present Vocational School. In modern times graphite has become an important mineral. It is used for the manufacture of pencils, dry lubricants, grate polish, paints, crucibles and for

Codes: L1 / EXPL / GEOL / IDX_Names: Saint John Graphite; Exploration - General; Geology - General;
S.J. Weekly Chronicle - Jun. 1, 1838 It has been suggested that a Geological Board should be formed, under whose direction Geological Surveys of the Province ought to be conducted; and at whose disposal, all sums of money granted by the Legislature for that purpose, should be placed. For reasons sufficiently obvious, this Board should be composed of persons of standing in society, of acknowledged acquirements, and holding public office; such as the Professors of Natural Philosophy of King's College, the Province Secretary, and the Commissioner of Crown Lands. It cannot be conceived, how Surveys conducted in any other manner can be useful to the Province; and they will only lead to the unprofitable and prodigal waste of the public money. We shall, otherwise, pay dear for many discoveries like the following: Black Lead - Plumbago, Graphite - This substanceis found in considerable quantity in a vein appearing at the surface, and running along the south west side of the hill at Fort Howe. It has been long known, under the first of the above names to the inhabitants in the neighborhood, and has been used by them for common purposes, and some of it was collected by the accomplished Professor of Natural History and Chemistry at King's College, when he passed through this city about a year ago. The fields adjoining Fort Howe abound withvarious ores of iron; some specimens of which were sent to England nearly twenty years since. So much for the discovery of Mr. Gesner and the information of the Editor of the Courier. The principal localities of all our most useful minerals such as coal, marble, iron, manganese, are 6 pretty generally known in the districts where they abound. We only want capital and enterprise, and men withpractical knowledge to direct their proper employment. But it is evident, a vast deal of wealth must sink, before those productions of our soil can be worked with any advantage to the Public, or to those who are disposed to speculate in undertakings of

this sort. The Geognosy of the Province is, doubtless, interesting as a branch of science, and will it is presumed, engage the attention of the Professors of King's College, to whose department it belongs, in the course of public instruction. [Communicated]."

Daily Sun - Aug. 21, 1897 Granite and Graphite. - One Being Shipped to Aberdeen, the Other to London. - Aberdeen is a granite town, but it is importing that article from St. John. At the Pettingill wharf may be seen today seven carloads of Welsford granite, about 100 tons in all, to be shipped on the s.s. Damara of the Furness Line to London and thence to Aberdeen. Other shipments are to follow. The Damara, which is due here today, will also take to London 100 casks of graphite from the mine now being operated just above the suspension bridge, near this city. This is a first shipment, which will also be followed by others. The development of these two new items of trade illustrates the value of having direct steamer communication with ports on the other side."

Novascotian - Jul. 7, 1851 and Morning News - Aug. 6, 1851 Nova Scotia and New Brunswick Minerals. - The following is from the supplement to the ""Illustrated London News"" of the 24th ult., in reference to some of the valuable minerals of these Provinces, sent to the Great Exhibition. ""In the same Colonial Court as that in which wesee the production already referred to, will be found specimens of Asphalte, from New Brunswick and a quantity of plumbago, or black lead from St. John, in the same colony. The latter is not of such a quality as to possess value for the higher purposes for which the material is required; but it is quite sufficient for machinery and for household use. It is flaky and of good color; but wants compactness. Not far from these specimens will be found some interesting minerals from Nova Scotia ... Mr. Archibald..."

Morning News - Sep. 20, 1852 and Miramichi Gleaner - Sep. 25, 1852 Sir Charles Lyell's Opinion of New Brunswick. -This eminent Geologist, now in New Brunswick, has visited some of the districts of Westmorland, and other parts of the Province - and we are gratified to learn that he expresses a highly favorable opinion of the geological features of this country, so far as his observations have extended. We understand that he is unable to decide the question of the Lawyers, as to whether the substance found in Albert, in such abundance, comes under the cognomen of Coal, or Asphaltum, as its character differs from both. It being a new thing to science, Sir Charles is puzzled to know, on first examination, what to callit. When in St. John he visited the black lead, or plumbago mines, at the Falls, and remarked that Anthracite coal would yet be found in that vicinity, immense beds, as this plumbago was but the outer corruscation of the treasure within. We hope the company will keep on digging until they strike a vein, and their fortunes are made. In the opinion of Sir Charles Lyell, this Province abounds in mineral wealth - such as coal, copper, &c. &c. - which will one day be explored and developed to the enrichment of the inhabitants. It requires but enterprise and capital to bring about these ends. Opinions from such a quarter, cannot be over estimated. If Professor Johnston was capable of giving our Agricultural capabilities a good character, professor Lyell will assist us in the mineral kingdom. We hope yet to hear from him, under his own hand. No doubt he will write a treatise upon what he has seen and approved of, 9 in this Province. That alone will do us an immensity of good. We are informed that Sir Charles Lyell and our Lieutenant-Governor were schoolmates. In company with Lady Lyell he intends to make a journey to the Rocky Mountains for Geological research, and the pleasure which the prosecution of science affords him. We hope when he returns to England he will give New Brunswick as good a name as he may think it deserves. - St. John Morning News."

Morning News - Aug. 14, 1850 ""Gold"" in New Brunswick. - If this Province were thoroughly explored, it would be found that we possess as much real wealth, as is contained in the placers of the Sacramento; and our young men, instead of going abroad to gather gold, and risk their lives, would be induced to remain at home, where a better remuneration would reward their toils; and the day will shortly come when this will be the case, for our people are gradually becoming acquainted with some of the hidden treasures of our New Brunswick soil. A few months ago, we had the pleasing task of writing a short article upon the valuable sharpening stone recently discovered near Miramichi,which carpenters in St. John pronounced to be superior, and worth from 3 to 5s per pound. This morning we have a still more gratifying duty to perform. Within a mile and a half distance from this city, near the Falls, a discovery, consisting of black lead, was a short time since made, which bids fair to become a great and valuable staple article of export from this Province, equal to gold itself. A company, consisting of six spirited gentlemen, was at once organized - they leased the ground from the Government, consisting of a superfices of three miles in extent; and set men to work to dig. A specimen of this lead, got out yesterday, may be seen at our office - it is as pure as if it had been manufactured for use, whereas in England, from where we 5 obtain our black lead, the yield is only 70 per cent to the miners, the other 30 being of foreign substance. The

supply near the Falls is inexhaustible. The surface of the earth for two miles is coated with it, and the deeper it is dug, the purer is the quality. Millions of tons of black lead, superior to any in the world, now lies at our feet for use and exportation; and our readers may have some idea of the value of the article when we inform them, that our merchants have been in the habit of importing black lead from England, and paying 38s per hundred weight for it. The article as it is dug, will command in the English market œ20 a ton - and a much higher price in the markets of the United States, where, we are informed, the duty is but nominal. The St. John Mining Company - the designation they are known by - have already shipped 44 cwt. of New Brunswick black lead to Liverpool - to New York 240 cwt. - and as much more to Boston. We are told that there is no black lead to be found in the United States - but that it is all imported; and we also learn that so scarce was the article in the market a short time since, that a large establishment in New York had to suspend operations until a supply arrived from England. Mr. Edwin Ketchum, one of the enterprising members of the company, informs us that in the vicinity of this black lead field, iron of the best description, equal to that of Woodstock, abounds. Now, only think of it. Nature has lavished riches upon this land in inexhaustible abundance, and yet it has slept within the bowels of the earth since the world began, without our people ever knowing, or apparently caring, what treasures they possessed. If the fence which separates this rich, yet poor, land from the great nation adjoining, were once broken down through means of an extended commerce and intercourse, New Brunswick would be found to surpass California for wealth, because our treasures are multifarious in their character. But until we have Free Trade, Railroads, or Annexation, our province will not be worth anything, comparatively speaking, to the present generation. It is positively a sin for man to be so indifferent to themselves, when God has done so much for them. Let us now, one and all, take hold of the great railroad as a preliminary step towards developing our valuable resources. Our friends will please call and examine the

N.B. Courier - Apr. 17, 1852 Ships cleared. [column not regularly checked] -Grindstones, black lead, lime, coal, limestone."

Codes: LIME / IDX_Names: Lime - General;
About 1761 In ""The River St. John"", by W.O. Raymond, 1950, Keystone Press, Saint John, p. 136. James Simonds was born in Haverhill, Massachusetts, in the year 1735 set out in company with his younger brother Richard to seek his fortune. Finding that the mouth of the St. John river was an admirable situation for trade with the Indians, that the fishing was excellent, that there was a large tract of marsh land, and also lands that afforded great quantities of lime-stone, Mr. Simonds eventually gave the preference to this locality as a place of settlement and, having previously obtained a promise from Government of a grant of 5,000 acres in such part of the province as he might choose, he with his brother
1764 In ""The River St. John"", by W.O. Raymond, 1950, Keystone Press, Saint John, p. 178. Captain ... Beamsley Glazier would have made a good immigration agent... ""The entrance of St. John's River,"" he writes, ""forms like a Bay between two points about 3 leagues apart, from thence it grows narrower gradually up to the Falls, which is 200 yards broad... On each side of the falls the rocks are high and so continue about four leagues, all limestone...""

Circa 1768 In ""The River St. John"", by W.O. Raymond, 1950, Keystone Press, Saint John, p. 194. Simonds and White - ... The company had four lime kilns, the situation of which will be best understood by reference to modern landmarks. The first was at the base of Fort Howe Hill at the head of Portland Street, a second near the site of St. Luke's church, a third near the present Suspension bridge, and the fourth on the road leading to the ""Indian House"". The work of quarrying and lime burning was carried on in primitive fashion by the laborers of the company. In the winter a number of them were employed quarrying the stone and hauling it with oxen to the kilns. The wood for burning grew almost on the spot where it was wanted, and its cutting served to clear the land as well as to provide the necessary fuel. In the course of ten years Simonds & White shipped to Newburyport and Boston more than 3,500 hogsheads of lime for which they received four dollars per cask; they also sent lime to Halifax, Cornwallis and other places in Nova Scotia. The facilities for manufacturing in those days were very inadequate, the men lacked experience, casks were hard to get, and for a time the lack of a wharf and warehouse caused much delay in shipment. (See map on p.240 for location of lime kiln in Indiantown).
1769 In ""The River St. John"", by W.O. Raymond, 1950, Keystone Press, Saint John, p. 194. In the year 1769 the company (Simonds & White) built the first wharf and warehouse at the Point... Mr. Simonds writes under date March 6, 1769: ... Have got... about 300 Hogshead Lime Stone to the Kiln, and should have much more if there had been snow. ... Shall continue drawing or dragging stone as long as the ground is frozen, and then ... boat stone for a Lime Kiln..."
1770 In ""The River St. John"", by W.O. Raymond, 1950, Keystone Press, Saint John, p. 195. The next winter was a severe one, Mr. Simonds writes on May 10: ""The spring has been so backward that there has been no possibility of burning any lime. The piles of wood and stone are now frozen together...""
1771 In ""The River St. John"", by W.O. Raymond, 1950, Keystone Press, Saint John, p. 200. Among the buildings at Portland Point when the Hazen family arrived were the residences of the three partners (Hazen, Simonds and White), a

Royal Gazette - Jul. 31, 1827 We understand that an extensive quarry of limestone has been recently discovered upon some land belonging to Col. Fraser on the south side of Tamisquatat Lake (about 190 miles from Fredericton). The stone has been tried and found very good; and such is the demand already for that most useful article, that we have been informed deposits have been forced upon Colonel Fraser to insure the first productions form the Kiln. This discovery will no doubt prove of the greatest value to the upper part of the province. Colonel Fraser has nearly completed the building of a kiln for the purpose in question, and we hope shortly to be enabled to lay before our readers some further particulars

City Gazette - Mar. 1, 1827 ADVERTISEMENT: Important To Agriculturists & Builders. R. Bickford, begs to inform the inhabitants of this City, and the Province at large; that he has commenced an extensive Lime-burning establishment, on the most improved English Principles; and as he burns with Coal, instead of Wood, he will be enabled to sell at a more reduced price than any other Establishment in the Country. He warrants the lime to be of the first quality, and may be had in any quantities, by application to himat his Lime Kiln in Portland, near Fort Howe. The use of Lime for Agricultural purposes is too obvious to need comment, and as the primitive object of this Establishment is to assist the farmer in his pursuits, all kinds of Country Produce will be taken in exchange, as also Timber, Cord Wood, &c. and a reduction made if taken from the kiln in Box Carts. Portland, September 28."

Nova Scotian - Nov. 1, 1827 ADVERTISEMENT: Lime. - James Crosskill has received from St. John's, N.B. per schr. Hibernia, Fletcher, 55 hhds White Lime. ..."

Nova Scotian - Nov. 8, 1827 St. John. - … lime … exists in the neighborhood of St. John in great abundance, for the whole ridge of rocks which flank it to the right is composed of limestone."

Gleaner - Nov. 10, 1835 New Brunswick Marble. - We have had an opportunity of examining different specimens of beautiful white Marble, brought from an extensive and valuable quarry lately discovered at Musquash, and owned by Messrs. Woodward. We understand it is the intention of 3 these enterprising merchants to have the quarry opened on an extensive scale, which will at once give many of our citizens an opportunity, and at a cheap rate, of beautifying their domiciles with this rich and chaste building material; while at the same time it will prove a valuable article for export, either to the home market as ballast, or to the United States. As all our vessels require a large amount of ballast, we are of the opinion that each might make a more profitable business by carrying it in place of the present unproductive system. The marble has been pronounced by competent judges to be quail to some of the Italian white marble, which generally sells at New York at ten dollars a cubic foot; so much for the value of the article in the United States. One of the specimens which we examined, contains serpentine blended with it, which gives it a beautiful appearance, and forms a valuable compound for ornamental purposes, and is generally known by the name of Verd Antique. We most sincerely trust that the quarry may realize the fondest hopes of the Proprietors, for every man who is instrumental in developing the resources of our highly favored Province, is justly entitled to the best wishes and thanks of the community at large; for all have an interest in whatever tends to promote the general prosperity of the country. - City Gazette."

N.B. Courier - Jun. 30, 1838 ADVERTISEMENT: LIME BURNING The Subscriber grateful for past favors, begs to intimate to his friends and the public generally, particularly those in Nova Scotia from whom he has received such liberal support, and to whom he trusts he has given general satisfaction, that they can still be supplied with LIME, warranted to be of the first quality, at the shortest notice. Having furnished himself with a Wood Boat, he is ready to deliver any quantity to persons residing on the River St. John or at Fredericton with the least possible delay. N.B. - The Casks will in future be branded with ""John Stevens, West Hill"" JOHN STEVENS West Hill, Lancaster, June 13, 1838"
Royal Gazette - Oct. 10, 1838 ADVERTISEMENT: Lime! Lime!! The subscriber has now resumed the manufacture of Lime at his New Kiln, about one mile below Fredericton, and begs, most respectfully, to inform the Public that it can be had in any quantity, on application at the Kiln or at the Store of Mr. James S. Beek. A fair price given for old Casks Archibald McLean. Fredericton, 22d August, 1838."

S.J. Daily Telegraph - Oct. 5, 1875 Exhibition. - Lime. - A fine quality of the barrel of lime exhibited by Messrs. Purdy & Green is well worthy the attention of plasterers and others interested in building."

Daily Telegraph - Oct. 3, 1876 Lawlor's Lime Kiln and Quarry. - Lime burning is one of the chief industries about St. John and Wm. Lawlor's kiln at Brookville furnishes the city with a great deal of lime used. Near his residence is the kiln which is supplied with three furnaces. An arch of brick covers the furnaces, and upon this the lime stone is placed to a height of several feet. As the heat increases the stone is kept constantly in the furnaces and it requires about 40 cords of it for one burning. From four to four and a half days elapse before the stone is burned sufficiently. The top stone that has been exposed to the air, has to be cast aside at that burning, as the cool air striking against the heat will not soften it sufficiently. To the rear of the kiln is the quarry which supplies the stone. It extends half a mile back, and the rock thus far has been found uniformly good. In a year and a half not much over a cart load has been found unfit for the purpose, so from that it must be inferred that the ledge contains good material. About 1400 barrels are burned in the year. There is not much demand for lime in winter, and but little is made. Mr. Lawlor finds a ready market in St. John, and does not send much abroad. In summer fires are kept almost constantly in the furnace to fill his orders, and he rarely has any on hand long. Three men are kept constantly employed, the duty of one being at the fires."

Evening Telegraph - Jun. 7, 1877 New Lime Kiln. - Messrs. Miller & Woodman have erected a lime kiln on the right bank of the river, about a mile above Indiantown, where there is a good quality as well as a large quantity of lime stone. The kiln has already been used."

Morning Freeman - Nov. 3, 1877 The Lime-Burning Schooner. - The fire in the hold of the schooner Calvin not having abated, the vessel was taken over to Carleton, where she is now scuttled. The hatches were taken off, and one man who attempted to go near was so badly affected by the escaping fume and smoke that he fell upon the deck and was restored with difficulty. The schooner is so badly burned and charred inside that much expense will be required to repair her, besides losing the entire cargo."

S.J. Daily Telegraph - Aug. 16, 1881 Lime Kilns. - A great deal of lime is burned throughout the counties of Kings and Queens. This lime is principally used by the farmers."

Daily Telegraph - Mar. 21, 1881 Fire at Green Head. - Mr. Joseph Armstrong, lime burner, Green Head, lost his valuable cottage, which was destroyed by fire on Saturday morning. The fire was discovered by the workmen in the kiln, about 200 yards off. They hastened with Mr. Armstrong to the burning building and began removing the furniture, but, owing to the intense heat of the flames, which threatened the destruction of the outbuildings, not more than half the furniture was removed in safety. The men found it difficult to confine the fire to the main building, but they finally succeeded, by the free application of buckets of water. The main portion of the building was two stories high and the ell two and a half stories. There were nine bedrooms, well furnished, but only the contents of two were saved. Mr. Armstrong kept a safe in the house, containing his books and business papers, all of which were preserved, as the fire did not work into the body of the safe. The building was insured for $1,000, and the furniture for the same amount, in the Western office."

Fredericton Capital - Apr. 22, 1882 The lime kilns at Poquiock, owned by Mr. Chas. Miller, are in full blast, and large shipments to the United States are being constantly made. This promises to be one of our leading industries."

Moncton Daily Times - Dec. 8, 1882 and Weekly Transcript - Dec. 13, 1882 Albert. - Lime Works. - Messrs Atkinson & Son, of this place, have purchased the sole right to work the Curryville Lime and Cement Works during the next year. They expect to burn about 10,000 barrels of lime in that time. It is a number one article and will find a ready sale."

Codes: LIME / IDX_Names: Lime - General;
S.J. Globe - Jan. 28, 1882 Equity Court. - On the 7th January, 1879, an injunction order was granted by Judge Wetmore in the case of Joseph Armstrong vs. John and George Raynes, restraining the defendants from placing on casks or barrels containing lime the words Greenhead Lime, or other marks in imitation thereof, or only colorably different therefrom, such mark being the plaintiff's trade mark. The plaintiff recently appeared before Judge Palmer and made oath that he saw the defendants shipping lime, at Indiantown, on the 4th of November last branded as follows: No. 1 Greenhead Lime manufactured by John Raynes & Son, and applied to His Honor to commit the defendants for breach of injunction order. The defendants were able to show, however, that the casks were marked Extra No. 1 Lime, manufactured by Raynes Bros. at Greenhead. The only question in the case, said His Honor in giving judgement to-day, is whether or not the doing this (described above) is a breach of the injunction order, or rather whether it is such a breach as I ought to commit the defendants for. After reviewing all the facts and arguments brought forward, His Honor said he would dismiss the application, and say nothing about the costs - the plaintiff to have the liberty to renew the application to use this mark and

it has the effect of making customers believe, when they are buying it, that it is the same description of lime as had been sold by the plaintiff as Greenhead lime."

Daily Telegraph - Jul. 7, 1882 Messrs. J. & F. Armstrong, of Green Head, manufacture from 300 to 400 casks of lime per week, for all of which they find a ready sale in this Province and Nova Scotia."

Daily Telegraph - Jul. 13, 1882 Messrs. Morrow and J. & T. Armstrong have three scow loads of lime discharging at foot of Market Square."

Daily Telegraph - Nov. 13, 1882 The Lime Trade. - Mr. Charles Miller's new draw kiln, at Poquiock, will be fired, for the first time today. It is 18 feet square at the base, 41 feet in height, and lined with fire brick. Its capacity is 350 casks of lime per week. Mr. Miller proposes eventually to increase its height to 60 feet, when it will have a very monumental appearance. One of the principle advantages of the draw kiln is that it can be worked continuously, and without the necessity of ever extinguishing the fires. The demand for lime has been unusually large the past season, and Mr. Miller had no course but to erect this kiln to enable him to meet the requirements of his customs."

Daily Telegraph - Nov. 14, 1882 The large demand for lime with which our manufacturers have been favored during the past season has caused quite a boom in hoop poles, which bring a high price and are in eager demand. The Soulange usually brings in a large quantity. Last evening she had 7,000 from the neighborhood of Cole's Island. If the lime trade should continue to increase as rapidly as during the past year, the cultivation of hoop poles might become a profitable

Moncton Daily Times - Nov. 22, 1882 The Hillsboro Cement Trade. - Schooner Lizzie arrived from Hillsborough today with a cargo of cement. A very profitable cement trade has been carried on between Hillsborough and the States this season. - St. John News, Tuesday."

Daily Telegraph - Apr. 4, 1883 The Lime Business. - The demand for lime from various Nova Scotia ports, and different sections in our own province, is unusually large for the season. Messrs. Armstrong Brothers, at Glen Cove, have been burning for several weeks and find it difficult to supply their customers promptly. Mr. Charles Miller, at Poquiock, has his draw kiln in operation, producing about 30 hhds. per day. Mr. Miller has three other kilns, which, when put at work, will increase his proceeds to 500 or 600 hhds. per week. The principal kiln is kept burning continuously, the lime being drawn from the bottom at a red heat while the stone is supplied at the top. Mr. Miller's sheds for the various purposes of his business are 50x100 feet, and in front of the property are some 1300 feet of wharves, at which the largest vessels that pass through the falls may always be moored with safety."
S.J. Daily Sun - Apr. 14, 1883 and S.J. Daily Sun - Apr. 28, 1883 ADVERTISEMENT: Brookville Lime. -- Brookville Lime in hogsheads and barrels. This lime requires a large quantity of sand, is strong in cement; therefore, it thoroughly withstands the weather and makes a fine, glossy white finish. No better in use. For sale by the carload or hogshead. Geo.

Daily Telegraph - Jun. 21, 1883 Norton. - A good many lime manufacturers supply themselves with staves cut by the new machinery lately placed in the Rankine mill."

Daily Telegraph - Nov. 19, 1883 Charles Miller's output of lime this season amounts to 12,000 hhds. Messrs. F. Armstrong & Co. are preparing to do a much larger business in lime, another season, than heretofore. The reputation of Poquiock lime stand high."

Daily Telegraph - Sep. 11, 1883 Lime Shipment. - One hundred and fifty casks of lime were shipped by Chas. Miller to Pubnico, N.S., yesterday. Pubnico is becoming a large fishing station, and a good deal of building is in progress there at present."

Codes: LIME / IDX_Names: Lime - General;
Moncton Daily Transcript - Aug. 13, 1884 Advertisement for Greenhead Lime ..."

Daily Telegraph - Feb. 11, 1884 Lime Burning. - Mr. Charles Miller is building a draw kiln, after the model of those at Rockland, Maine, the daily capacity of which is expected to be about 60 hhds. When this is completed Mr. Miller's output of lime will be larger than that of any other two manufacturers in Canada."

S.J. Daily Sun - Feb. 18, 1884 A New Lime Kiln. - Charles Miller's perpetual lime kiln, in course of erection at Poquiock, is built under the personal supervision of the patentee. Kilns of this description are kept constantly burning through the season, while in the old style of kilns the fire had to be extinguished before withdrawing the lime."

S.J. Daily Globe - Dec. 3, 1885 Lime Kilns. - Messrs J. & F. Armstrong, of Greenhead, are preparing a foundation upon which to build a large draw kiln. Mr. Charles Miller's draw kiln has been closed for the season."

S.J. Daily Sun - Aug. 2, 1886 The schrs. Maggie Willett and Nellie Bruce are now loading at his draw kilns at the Narrows, above Indiantown. A large number of men are kept in constant employment."

S.J. Daily Sun - Aug. 2, 1886 Chas. Miller, lime burner, is doing quite an extensive business in shipping lime to the New York market."

S. J. Globe - Dec. 11, 1886 The Lime Business. - Owners of lime properties are jubilant over the future prospect of the lime business here. It is alleged that the Rockland quarries are about to be exhausted, and that quite a number of American speculators are casting their eyes in the direction of St. John, and are looking for sites on which to begin operations. The prospects of a flourishing lime trade here would seem to be good, as the supply of rock is almost

S.J. Daily Sun - Nov. 26, 1886 Lime Making. - On a Large Scale at Glencoe - Hayford and Stetson's Latest Enterprise. - In August last Hayford & Stetson made arrangements with Joseph Armstrong, the lessee of the Glencoe property on the St. John river, about two miles above Indiantown, to burn two kilns of lime for the purpose of testing the quality of the lime rock at that place. The lime was shipped to New York, where it was subjected to a thorough test and was found to be of the best quality. The lease of the property was then purchased by Hayford & Stetson, who subsequently released the place for a term of twenty one years. About six months ago the excavating for the foundation of two large draw kilns was commenced on the property. The work has been vigorously pushed forward and the erection of the kilns has been commenced. The kilns will be built by Messrs. Kirk and Rankin of Rockland, Me., both of whom are men of large experience. On their completion the kilns will be the best in the province and will burn about 65 casks of lime every twenty-four hours. A wharf has been built in front of the kilns, 160 feet in length and 60 feet in width. A shed is in course of erection, which will cover the wharf and the space in front of the kilns. The wharf was built by Albert Jones, and Albert Mabee is building the shed. It is the intention of Messrs. Hayford & Stetson to continue the wharf down the river a distance of 600 feet, also to put up a large cooper shop and other buildings which will be required in the prosecution of the work. A large quantity of barrel staves have been stored and several thousand barrels will be manufactured during the winter months. These staves were sawn in Messrs. H. & L.'s mill at Indiantown. Four hundred cords of wood have been purchased and are now piled on the wharf for use early in the spring, as it is the intention of Messrs. H. & S. to commence burning in March. The cost of these kilns, wharf and building will be in the vicinity of $15,000. When the kilns are in operation between 20 and 30 men will be given employment."

S.J. Globe - Oct. 9, 1886 Sale of Lime Property. - Messrs. Jewett & Co. have disposed of their lime kilns, quarries, etc., at Drury Cove, to some gentlemen belonging to Rockland, Me. It is understood that Messrs. Jewett received a good round sum in exchange. The new owners will enter into possession shortly. They intend prosecuting the work of manufacturing lime in a vigorous manner. During the summer their shipments will be brought down by way of the river, and in the winter the railway will probably be utilized."

Daily Telegraph - Apr. 15, 1887 and Moncton Daily Times - Apr. 16, 1887 A New Lime Kiln. - A new draw lime was started yesterday morning by Messrs. Armstrong and at night 30 barrels of lime were taken out. The kiln gives promise of being a successful enterprise."

Codes: LIME / IDX_Names: Lime - General;

S.J. Daily Sun - Aug. 31, 1887 The Lime Business. - Few people have any adequate idea of the proportions which the lime burning business has assumed here. For many years the Rockland kilns have supplied the Boston, New York and Philadelphia people with lime, but as the lime rock is difficult to obtain there they have to look to other places for the supply. The St. John manufacturers are doing a good business this season, and it is altogether likely that they will do better next year. Following are the number of barrels of lime manufactured per day by the different firms in the business: Achorn & Co., Drury Cove, 100 bbls; Hayford & Stetson, Indiantown and Glencoe, 400 bbls; Chas. Miller, Glencoe, 300 bbls; Armstrong & Co., Cedar Cliff, 200 bbls; J. & F. Armstrong, Green Head, 125 bbls; Purdy & Green, Adelaide road, 50 bbls; W.D. Morrow, Adelaide road, 20 bbls; Lawlor & Sons, Lawlor's lake, 100 bbls; Wm. Honeybrook, Torryburn, 100 bbls; other manufacturers at South Bay, etc. 25 bbls. This makes the output over 1,400 barrels per day and over 170 men are

Daily Telegraph - Dec. 12, 1887 The Manufacture of Lime. - Nearly 200,000 Barrels Burned by the St. John Lime Kiln Men During the Season. - Nearly All of it Shipped Across the Line. - About 40 years ago the only lime kilns in the vicinity of St. John was between where Connor's rope works now stand and the Millidgeville Road, and was owned and worked by Henry Rogers, and afterwards, in 1873, purchased by Purdy and Green. Since that time several lime kilns have been built - one at Green Head, owned by Joseph Armstrong, one at Glen Cove, by Armstrong Bros., one at Brookville by Mr. Lawlor, and one at Pokiock by Chas Miller. The trade was chiefly local, however, until three years ago when Chas. Miller built the first draw kiln in New Brunswick, and since that time many have followed his example and gone into the lime business extensively. Last year, Mr. Miller built two more draw kilns, doing away with the old style of square kilns. During the season he manufactured about 60,000 barrels of lime, nearly all of which was shipped to the states. Messrs. Armstrong & Co.'s kilns at Glen Cove, consist of two square and one draw, the latter being built last spring by Mr. Frank Armstrong. The square kilns were started March 1 and the draw kiln May 1. They have turned out 40,000 barrels of lime, 36,000 of which were shipped to the states. Messrs. Armstrong & Co. are at present engaged in building a new draw kiln and expect to have it finished in the spring. Messrs. Hayford & Stetson have the largest lime works in Canada. They have five kilns at Indiantown and one at Glen Cove. All of the kilns were built last spring. The draw kiln at Glen Cove was started February 1, the three square kilns at Indiantown June 1, and their two draw kilns at the same place July 21. They manufactured 64,870 barrels of lime, 62,000 of which found a market across the line. The stone that is used in the Indiantown kilns is hauled from Messrs. Purdy & Green's quarry. Messrs. Purdy & Green have manufactured 20,000 barrels. Their trade is carried on chiefly in Nova Scotia and Newfoundland, up to three weeks ago, when their works were destroyed by fire, but with great energy they have been promptly replaced by larger ones. The lime kiln of Mr. J. Armstrong, at Green Head, have been running steady all summer, and the trade is chiefly local."

Codes: LIME / IDX_Names: Lime - General;
S.J. Daily Sun - Jan. 13, 1887 St. John Lime Kilns. - Extensive Operations At Drury Cove and at Glencoe. - At Robertson's Point, at Randolph, at South Bay, etc. - A Business that is Developing Large Proportions. - The manufacture of lime is destined to become even a more important an industry than at present in the vicinity of St. John. Few have any adequate idea of the number of men to whom the business gives employment during the summer months. After the great fire of 1877 the manufacture of lime was commenced at a number of places in the immediate vicinity of the city and since then it has been profitably carried on by several firms. The lime used in New York, Boston and other large American cities has heretofore been obtained from Rockland, Maine, where vast quantities of lime are burned annually. The St. John manufacturers did not until a few years since ship much of their output to the United States, but of late Americans have purchased the interest of several St. John parties in some of the kilns, and the output this year will be greatly in excess of that in any previous year. The deposit of lime rock at Rockland has in some instances been exhausted and in others it has become so difficult to obtain the rock that there is little money in the business. Then again, the wood required for burning the lime at Rockland has to be imported from New Brunswick and parts of Nova Scotia, while St. John has an abundance of wood at her very door. The wood which accumulates at the various saw mills can be utilized in some kinds of kilns, and can be obtained at an exceedingly low price. The wood which is required for use in the draw kilns can be bought here for about half what the Rockland people have to pay, which in itself is no inconsiderable item. The deposits of lime rock at the Narrows just above Indiantown, and on the Adelaide road, Portland, are almost inexhaustible and that at Drury Cove will not give out for many years to come, be the output what it may. The facilities for the shipment of lime to the United States are excellent, both by sea and by land. The number of kilns in course of construction at the places named show that the various manufacturers will this year burn many thousand barrels, in fact it is almost impossible to estimate what the output will be. Two kinds of kilns are used in the business - the square and the draw kiln. The former will burn about 425 barrels of lime per week, and in the latter about 100 barrels can be manufactured each day. The square kiln is filled with stone which is burned as long as required and then the fire has to be put out and the lime taken from the kilns. The draw kiln is a much better one, as it is not necessary to extinguish the fire, the lime being drawn out as it is burned, and fresh stone put in. It will be seen that the latter possesses many advantages over the other, but it costs much more to build the draw kiln than is required for the construction of the other. Hayford and Stetson, the well known lumber manufacturers, have purchased from Joseph Armstrong his lease of the Glencoe property, above Indiantown, and have released it for a period of twenty one years. They have built one draw kiln on the property and intend constructing another. The new kiln is a large kiln, capable of burning 65 casks of lime every 24 hours. They will commence burning lime in it in the course of a few weeks. A wharf has been constructed in front of the kiln, 160 feet in length and 60 feet in width and a shed has been erected which covers the surface of the wharf. They have also a cooper shop in which the barrels required will be manufactured. This firm has just commenced excavating near the mill at Indiantown, for the foundation of two more draw kilns and three square kilns. They will build a large wharf on the river front and on it will be erected a cooper shop and other sheds for required for the prosecution of business. In the square kilns at the mill it is intended to utilize the wood from the mill, and the kilns are so close to it that the men who wheel the wood from the mill can dump it at the fires. When they complete these, Messrs. H.& S. will have expended in the vicinity of $20,000, and they will give employment to about 40 men. As there is no lime rock near the mill Messrs. H. & S. have contracted with Purdy & Green to supply the rock required. This firm will quarry it at their place on the Adelaide road. Messrs. Purdy & Green who had this property leased for a term of years, have purchased it, and their contract with Messrs. Hayford & Stetson extends over a period of ten years. They have just placed a steam drill at the quarry, the first of its kind ever used here, and they will employ a large gang of men. Messrs. Hayford & Stetson expect to burn about 50,000 barrels in the draw kiln at Indiantown, and 30,000 barrels in the square kilns. The property at Drury Cove, on the Kennebecasis, on which Messrs. Jewett & Co. manufactured lime for many years, has been purchased by an American syndicate. Among those interested in the business are the most extensive lime manufacturers of Rockland. The property was acquired by them in October last, and it is conducted under the name of the Drury Cove Lime Company. The deposit of lime there is as large and as good in quality as any to be found in the world. There are on the property now three kilns, and three more draw kilns will be built this year. They are burning in one of the draw kilns at present and employ about 25 men. When their new kilns are completed they will give employment to at least 60 men. The facilities for shipment are unexcelled, the wharves required having been built by Messrs. Jewett. Charles Miller has carried on a large business at Robertson's Point. Mr. Miller's property is an excellent one and he has everything that is required for a very extensive business. He has two draw kilns and one square kiln and employs about 25 men. Purdy & Green have one kiln of each kind and will burn a large quantity of lime this year. They employ 15 men and will require between 30 and 40 this year in burning and getting rock for Hayford & Stetson. Randolph and Baker of Randolph, from whose mill large quantities of

wood are hauled during the summer months, have for some time been endeavoring to ascertain in what way this wood can be utilized to advantage. Their mill stands on two lots owned by the corporation, and they have under lease two lots a large deposit of lime rock, and some years ago a kiln was built by Mr. Baker's brother, but it has not been used for some years. Messrs. R. & B.'s lease of these lots expires in the course of two or three years, and under the conditions of the lease they are not allowed to make any improvements on the property exceeding $500. They have asked the common council to renew their lease for a period of years, giving them permission to put whatever improvement they see fit on the lots. This matter will be considered by the general committee of the council at an early day. In case the council decides to grant their request Messrs. R. & B. intend to build a draw kiln and to use the square kiln as well. The wood from their mill is suitable for use in the square kiln and the fuel for the other could be easily obtained. The rock would have to be quarried and conveyed to the kilns on a railway, but this would not be a very great undertaking. If the new lease of the property is granted them the firm will go into business very extensively. W.D. Morrow employs eight or ten men at his kiln on the Adelaide road. Frank Armstrong, who has a square kiln on his property in the Narrows and is having a draw kiln built, will go into the business more extensively this year than ever before. J. & F. Armstrong will burn in their two square and new draw kilns this season, and their output will be much larger than in the past. Isaac Stevens and A.L. Bonnell each have a square kiln at South Bay, in which they will burn this year. Mr. Hornebrook and Wm. Lawlor & Son of Brookville, manufacture principally for the home market and will burn about the same quantity this year as last. There are others

Codes: LIME / IDX_Names: Lime - General;
Chignecto Post - Jan. 20, 1887 The output of the St. John lime kilns this year will be greatly in excess of any previous year. A single firm at Indiantown expects to burn about 80,000 barrels."

S. J. Globe - May 6, 1887 St. John lime is finding a steady market from 95c. to $1 per bbl."
Chignecto Post - May 19, 1887 The St. John lime trade is looking up. A large trade is expected between Boston and New York, by means of vessels, this season."

Daily Times - May 20, 1887 Petitcodiac. - Mr. John A. Hughes has succeeded in building a lime kiln altogether different from any ever built here before; coal is used instead of wood, consequently they do not have to watch it nights nor Sunday, and yet burn all the time. He is now drawing about 15 barrels a day of a very excellent quality of lime. He is satisfied that he can burn much more than this when he gets the stone on hand. We wish him every success in his new enterprise, for it is a worthy one. - Telegraph."

Daily Telegraph - Oct. 3, 1887 The Lime Business. - Saturday afternoon, in company with Mr. J.B. Patton, of Messrs. Hayford & Stetson's, a Telegraph reporter visited the quarries at Glencoe. They have at present about 30 men engaged in blasting and scooping lime rock to their kilns at Indiantown. Last week they turned out of their square kilns 922 barrels of lime and 1,493 out of the draw kilns. They have about 40 men employed at the kilns and are doing a rushing business, employing five vessels carrying to the United States."

Codes: LIME / IDX_Names: Lime - General;
S.J. Globe - Sep. 5, 1887 The Lime Industry. - The lime business is one of the oldest and one of the most important industries about St. John, and within the last two years it has been given an additional importance on account of the number of new firms that have gone into it. Most of the new houses are American, and they send their lime as soon as manufactured either to New York or Boston, where it is in great demand, but where prices are not very good owing to the efforts that are being made by the dealers in Rockland, who long held the monopoly of the trade, to undersell the St. John people and thus run them out of business. The firms in St. John county that are connected with the business are, Messrs. J. & F. Armstrong, Armstrong & Co., Acorn & Co., Hayford & Stetson, Chas. Miller, Purdy & Green, Lawlor & Sons, Wm. Honeybrook, W.D. Morrow, and several other small dealers. The average daily output from the county is 2000 barrels or 1000 casks and employment is given to between two and three hundred men and when it is taken into consideration that in 1835 when the manufacturers turned out 1100 casks for a year's work and thought they had done something wonderful, a good idea of the growth of the industry can be gained. In addition to the business done with the American market there is also a large business with Nova Scotia and points in New Brunswick, this trade is chiefly handled by Messrs. J.& F. Armstrong who run the kilns, at Green Head, which were visited a few days ago by a Globe reporter. Green Head, is one of the prettiest and most attractive points on the St. John river. It is about three miles from Indiantown and can be easily reached by water, and has a good wharf accommodation. The rock here is the best that can be found anywhere for the manufacture of lime, and Mr. Armstrong says that for that simple reason they manufacture the best article. Kilns have been running on Green Head since about 1812, being first started by Mr. Dollard, who was succeeded by Mr. Chisholm. He in his turn gave place to Mr. Robinson, who ran it until 1840, when it passed into the hands of Mr. J. Armstrong. Mr. Armstrong was then a young man of 25 years of age, and had been employed for five years as a hand in the kilns. Since that time the place has remained in the possession of the Armstrongs, and is likely to remain with them for some time to come. When one is told that lime has been manufactured at Green Head since 1812, he is very apt to think the place must be pretty well used up; but when he looks at the huge cliffs and the hole in the face of them, he naturally says to himself; well if they have only done that much in so many years, they never will get through the cliff; it is doubtful if they ever will, for Mr. Armstrong says it is what might be termed an inexhaustible quarry

and it possesses advantages held by no other. It is so near the kilns that no teams are needed to haul the broken rock, the men only have to wheel it a short distance in barrows and dump it into the kilns. The scene around a lime kiln is quite a busy one. Work is given to quite a number of men, there being the quarrymen, who are engaged constantly getting out rock to be burnt; the coopers, who manufacture barrels and casks to hold it; the firemen, who run the kilns; the scowmen, who transport the lime from one place to another; besides numerous other assistants. Until a couple of years ago all the lime was burnt in what is now called the old fashioned square kiln. These were large houses of stones into which the pieces of lime rock were piled until the houses were filled up. In piling the stones up a couple of fire places were left, and when the fires were lit they were kept burning continuously for five days and then let cool off. The lime was taken out and put up in casks or barrels as the case might be and the kiln refilled. These kilns yielded about 200 barrels a week. There are numbers of these kilns still in use, but they are rapidly giving place to what is known as the draw kiln, a structure of stone thirty five feet high and twenty feet square, lined on the inside with fire-brick and with an opening from the top into which the lime rock is thrown. These kilns have two fire places in them one on either side directly opposite each other and the rock is burned between them and is drawn out from an opening in the bottom of the kiln beneath the fires. These kilns are kept full constantly and are drawn every eight hours. They burn about 120 barrels of lime a day and are a vast improvement over the old square kiln. All of the lime kilns are built alike but none of the manufacturers have greater natural advantages for the carrying on of their work as have Messrs. Armstrong. And in Mr. J. Armstrong who has spent 52 years of his life at the business they have a manager whose superior cannot be found. Nearly all of the lime kilns around St. John are managed by men who have learned the business with him and he is very commonly spoken of as the New Brunswick pioneer of the lime industry. This industry would seem to be still in its infancy for the cliffs along the mouth of the St. John river may be spoken of as nothing but lime and judging from the way the manufactured article has been received in the great cities of the United States it is but natural to suppose that when better known the supply will not

Codes: LIME / IDX_Names: Lime - General;

S.J. Daily Sun - Apr. 11, 1888 The Lime Business. - Large Increases of Shipments to the United States. - The lime business during the past few years assumed very large proportions. If in 1883 when $1,027.05 worth of lime was shipped to the United States, any person had ventured to say that the quantity shipped last year would be of the value of $70,000 he would have been laughed at. Yet this immense quantity was exported to the States and the amount sent to Nova Scotia and the upper provinces was very considerable. The deposits of lime rock in the immediate vicinity of St. John are inexhaustible. The rock is of the very best and up to the present no difficulty has been experienced getting it out. The quarries at Rockland, Me., from which New York and Boston obtained their lime are beginning to give out. Such vast quantities of rock have been quarried that it is very difficult now to get the rock out. Then the wood which is used for burning the lime in the kilns has to be brought from this province and Nova Scotia, the men in the business being able to cut wood here and have it carried to Rockland at a less cost than if they purchased their wood in the State of Maine. In 1885 our lime merchants shipped less than $7,000 worth of lime to the States, and in 1887 lime to the value of $70,000 was exported. Our men have many advantages over the Rockland people. They can get out the rock at a much less expense, they have the wood right at their kilns, and the amount paid for the carriage of the lime is not excessive. Lime going into the United States has to pay a duty of 10 per cent., and if this were removed, the business would be greatly benefitted. The lime manufacturers think that if the Canadian government would take the duty off lime, the United States government would do the same. At all events they say we would lose nothing by the removal of the duty on lime coming into Canada. There are a number of firms engaged in the business in close proximity to St. John. They are J. & F. Armstrong, who have a draw kiln and a couple of square kilns at Green Head; Hayford & Stetson, who operate a draw kiln at Pokiok and two draws and three squares at Indiantown; Warner & Ketchum, who succeed Armstrong & Sorrell, work two draw kilns and one square at Robertson's Point; Chas. Miller of the same place, who burns in three draw kilns; W.D. Morrow, who has a square kiln and is building a square kiln on the Adelaide Road, Portland; Purdy & Green, who have a draw and a square kiln near the same place; an American company, who are running the draw kiln formerly worked by Jewett & Co. at Drury Cove; J. Hornybrook and Wm. Lawlor & Sons, each of whom have a draw kiln at Brookville; Messrs. Stevens and Bonnell, who burn some at South Bay, and Randolph and Baker, who have not as yet engaged extensively in the business. In addition to those who are required to run the kilns, men are employed getting out the rock, others are kept busy making casks, and scowmen are required to carry the lime from the kilns. The demand for lime in the American market is good at present and the manufacturers will ship larger quantities this year than last. All the kilns are now burning and in the course of a few weeks daily shipments will be made. The greater portion of the lime is sent by the New Brunswick railway. Following are the shipments made to the United States during the past three years by quarters:- 1885 1st Qr. 2nd Qr. 3rd Qr. 4th Qr. $618.30 none $2,482.90 $3,428.65 1886 $1,195.20 $6,268.20 $9,573.55 $7,494.23 1887 $6,108.40 $8.047.50 $34,276.70 $21,575.50 During the quarter just closed the quantity exported was

S.J. Globe - Feb. 21, 1888 Lime Kilns sold. - The lime kilns, above Indiantown, formerly owned by Messrs. Armstrong & Sorell, have been sold to Messrs. Warner and Ketchum. Mr. Armstrong, it is understood, will manage the kilns for the new

S.J. Globe - Feb. 22, 1888 and Daily Times - Feb. 23, 1888 It is estimated that between 125 and 140 persons are employed in the manufacture of lime at the various kilns at the mouth of the St. John river. The business last year suffered greatly by reason of the freshets which prevented manufacturers from shipping, the vessels being unable to get through the falls. When the freshet subsided larger vessels than those usually employed in the business were engaged and the result proved that a number of vessels arrived in New York about the same time, causing almost a glut in the market. Prices, as might be expected, went down and the margins of profits were, in consequence, reduced to almost nothing. But the outlook for this season is good and extensive preparations for an increased output are being made and a boom in the business generally is expected."

Moncton Daily Transcript - Jan. 18, 1888 Mr. Sorell, of the firm of Armstrong & Co., while going to the lime kilns at Cedar Cliff, near St. John, on Monday last, slipped on the ice and fell over a precipice and his coat caught on an old stump which saved him from going down about 50 feet. He was badly injured."
Royal Gazette - Jul. 18, 1888 Notice of Granting Letters Patent.Public Notice is hereby given, that under The New Brunswick Joint Stock Companies' Letters Patent Act, Letters Patent have been issued under the Great Seal of the Province of New Brunswick, bearing date the seventeenth day of July, A.D. 1888, incorporating Darius B. Warner, of the City of Saint John, Mill Owner; Ezeckiel B. Ketchum, of the City of Portland, Manufacturer; James R. Warner, of the City of Saint John, Mill Owner; J. Henry Leonard, of the City of Saint John, Accountant, and William C. Purves, of the City of Portland, Manufacturer; all in the City and County of Saint John, and Province of New Brunswick; for the purpose of the manufacture and sale of Lime, Marble, Lime and other Stone, and the leasing and owning of real estate, vessels or other property in connexion with said business, by the name of the Portland Lime Company, with a total capital of thirty thousand dollars to be divided into three hundred shares of one hundred dollars each. Dated at the office of the Provincial Secretary, at Fredericton, this seventeenth day of July, A.D. 1888 R.W.L. Tibbits, Deputy Provincial Secretary."

S.J. Daily Sun - Jul. 20, 1888 Portland Lime Company. - Letters patent have been issued incorporating Darius B. Warner, of the city of St. John, mill owner; Ezekiel B. Ketchum, of the city of Portland, manufacturer; James R. Warner, of the city of St. John, mill owner; J. Henry Leonard, of the city of St. John, accountant, and Wm. C. Purves, of the city of Portland, manufacturer, for the purpose of the manufacture and sale of lime, marble, lime or other stones, and the leasing and owning of real estate, vessels or other property in connection with the said business, by the name of the Portland Lime Company, with a total capital of $30,000, to be divided into three hundred shares of $100 each."

Codes: LIME / IDX_Names: Lime - General;
Daily Telegraph - Mar. 15, 1888 Messrs. Purdy and Green's new lime kiln was started last Monday."

S.J. Globe - Mar. 22, 1888 The Lime Trade. - What the Maine Manufacturers Ask of Congress. - Washington, March 20. - Mr. Dingley has presented to the House of Representatives and had referred to the committee on ways and means, the remonstrances of all the lime manufacturers of Knox county, without distinction of party, protesting against the proposition to place lime on the free list, and asking that the same duty (20 per cent) may be placed on lime imported from Canada that Canada places on our lime. The memorial states that about $3,000,000 is invested in the lime manufacturing and quarries in Knox county, and about 2,000,000 casks of lime are made per annum, valued at nearly as many dollars in the markets. Nearly the whole cost of making this lime is labor, i.e., including cost of wood, cask and transportation. This labor, says the memorial, costs only $1.12« cents per day in New Brunswick, and $2.00 in Rockland, Thomaston and Camden. At the present time this makes the cost of making a cask of lime in Knox county about 23 cents more than it costs to make lime on the St. John river in New Brunswick. The duty is only 10 per cent which with the undervaluation of imported lime and exclusion of cost of cask from the valuation according to decision of the treasury department, leaves now practically only about 4 or 5 cents protection on each cask, when it was equal to about 10 cents at the time the duty was originally fixed. In addition to this, the New Brunswick people have within a few years, under the invitation caused by a practical reduction of duty, gone into the business extensively, and will soon drive our lime manufacturers out of our markets unless the duty is made at least 20 per cent or 15 cents per cask. With lime on the free list, we should be reduced to the New Brunswick standard. The memorial states that the Canadian manufacturers shipped to New York in 1883 less than 5,000 casks, and in 1887 the shipment increased to 138,000 casks. This year it is estimated 200,000 casks will be shipped. When the bill gets into the House, the friends of the men engaged in the lime industry will make the best fight they can to prevent lime from going on the free list, and to place on imported lime a duty large enough to cover the difference in cost of labour in the two countries. The lime manufacturers of the United States are thoroughly alarmed at the situation."

S.J. Globe - May 17, 1888 The Lime Business. - New Brunswick Lime Found Superior to the American Article. - A Globe reporter found Mr. F. Stetson, the well known lumber and lime manufacturer, at his office in Indiantown, yesterday afternoon, and learned from him some interesting facts connected with that rapidly increasing business, the lime industry. A short time ago Mr. Stetson procured from a Boston dealer specimens of what are known as the best, medium and poorest qualities of Rockland and Rockport lime. These specimens were put to a chemical and a practical test in conjunction with six samples of the New Brunswick lime, and it was ascertained that the native article was much superior to that from the far famed quarries of Rockland and Rockport. In the practical test it was found that the lime from here was from 25 to 50 per cent stronger than the American article, that it is the New Brunswick lime in mixing for mortar would absorb much more sand than the other. In the chemical test, the lime from Messrs. Stetson & Co.,'s kiln, at Indiantown, proved 96 1/4 per cent pure. Two of the American specimens stood this test very well, but on the whole the home article made a better average here, as in the other test, than did its competitors. It is much easier and cheaper to manufacture the lime here than at Rockland, as in St. John the stone is all found above the surface, and in no case is it necessary to haul it any great distance to the kilns. In fact the only cost here is the labor of making barrels, cutting wood, etc. In Rockland the lime is all got by mining, which makes the cost of production much more expensive, as it is necessary to run pumping machines and other appliances of an extensive nature. In Rockland it is also necessary to carry the stone by teams distances varying from two to three miles which adds materially to the cost. The export from St. John last year amounted to about 150,000 barrels. The lime wherever introduced met with great favor and the demand for it has been growing continually, so that, the export this year, will, it is thought, reach about 500,000 barrels, or nearly twice the amount of last year's trade. This would be equal to 200 schooner loads. Mr. Stetson expects that his six kilns alone will turn out one hundred thousand barrels. The prospects for prices are good as compared with last year. Mr. Stetson is having an improvement put on his kilns at Indiantown, by which it is hop[ed to burn mill waste instead of cordwood as heretofore. Should the venture prove a success it will be of great benefit to both lime merchants and mill men as it will materially lessen the cost of fuel for the kilns and will provide a sale for an article which in the past the mill owners have been forced to burn. The only new kiln built at St. John this year is the one erected recently by General D.B. Warner, on the property purchased by him from the Messrs. Armstrong."

Moncton Daily Times - May 22, 1888 The Lime Industry. - Mr. F. Stetson, one of the leading lime burners in St. John, expects to turn out a hundred thousand barrels this season. He estimates the total product of the quarries above St. John will be this year three hundred thousand barrels, which will be double the sales of last year."

S.J. Globe - May 31 1888 Proposed New Company. - D.B. Warner, E.B. Ketchum, J.R. Warner, J. Henry Leonard and W.C. Purves, have applied for incorporation as the Portland Lime Co., capital $30,000, in three hundred shares of $100

Daily Telegraph - Nov. 26, 1888 That Lime Laden Brig. - The brig laden with lime, which has been on fire lately, has been towed to Stetson's wharf in Carleton where the cargo is being unloaded. It is estimated that about 200 barrels of lime are destroyed. The remainder will be rebarrelled and is not seriously injured. The interior of the vessel is badly burned."

Codes: LIME / IDX_Names: Lime - General;
S.J. Daily Sun - Apr. 3, 1889 The Lime Business. - Its Beginnings, Development and Future Prospects. - The Firms Engaged, - The Output. - The Export Trade. - The Comparative Value of the Industry. - There is something more than mere picturesque beauty in the heights that make the ruggedness of St. John scenery. Locked in the bosom of the hills are stores of wealth. Her limestone beds offer to enterprise a limitless field that only recently has been brought into prominence as the centre of a large and growing industry. The limestones of St. John county are in heavy beds, enclosed in quartzites and slates and with adjoining masses of gneissic rock. The principal quarries have been opened in the great central band which crosses the Narrows of the St. John river and extends eastwardly past Drury's Cove and Torryburn inland into the hills south of Rothesay. On the west side of the Narrows they cross Green Head and show themselves on the west side of South Bay. From this point they extend westerly in the direction of the Musquash river, but do not reach that stream. There are two outer bands of limestone rock, one on the south side of the main or central band; this runs from Douglas road, past Lily Lake and along the north side of the marsh; the other is found north of the great central band in the islands of the Kennebecasis river. This great body of limestone is not confined to St. John county, but in its extension eastward passes into Kings county and crosses the Hammond River between the Hampton post road and Beatty's ferry, and extending on to the eastward may be seen in the hills south of Hampton. In so great an extent of lime-bearing rock there is of course a considerable diversity in the quality; some varieties are decidedly earthy and impure, others pass into a fine quality of crystalline marble; but this is of little value as an ornamental stone owing to its highly fractured condition. There are two principal varieties which have been burned for lime. One is light colored and grey, or yellowish, and more or less magnesian; the other of a dark grey color, and is a purer lime, except that it contains a considerable amount of bituminous matter or carbon. This, however, disappears in the process of burning, and the resulting lime comes out white and pure. This is the variety which seems to be most prized by the lime burners, as giving a pure, strong lime. Of both varieties the supply is simply inexhaustible. Development of the Industry. - Although but lately worked to a large extent, the value of the limestone beds has long been known. There was a kiln started at Green Head in 1815. In 1842, according to Dr. Gesner, there were 19 quarries in operation in St. John county, the output of which was 6,000 hhds. (about 12,000 bbls.), valued at œ2,400. According to the census returns the output of the county was in 1851 about 56,000 bbls.; in 1861, about 41,000; in 1871, to the value of $37,385 (representing at the then ruling price less than as many bbls.); and in 1881 to the value of $39,664 - in the vicinity of 50,000 bbls. In 1871 there were 15 kilns, employing 66 hands and paying in wages $10,529. In 1881 there were 13 kilns, employing 75 hands, and paying $13,235 in wages. Prior to 1881, therefore, the industry had not developed to any large extent. There was as yet practically no export trade, for, though as early as 1823 schooners cleared for New York with lime, the trade did not develop. It is only within the last few years that the business has assumed large proportions. That in the last six years the export trade has gone from nothing up to nearly $100,000, and made St. John a formidable competitor of Rockland in Maine and in New York and Boston markets illustrates the capabilities of St. John and the marvelous development of the industry in that time. The following figures, taken from the records in the customs house, tell the tale: Year Value export 1884 … $2,033 1885 … 9,774 1886 ... 25,208 1887 ... 68,873 1888 ... 97,318 This is a remarkable development. But to appreciate the full extent of the industry it is necessary to remember that, while the export trade has so greatly increased, the maritime

province market has also been supplied in increasing quantities. Some of the lime sent to Nova Scotia has found its way from Halifax to Newfoundland, and some small quantities have been sent to Quebec. Another illustration of the progress made is the fact that a single draw kiln, as operated today, will turn out more lime in a season than the amount reported for the whole 19 quarries in Gesner's time. And this leads us to consider the development of method in lime production. The old-fashioned round kiln, with a capacity of 150 barrels, or thereabouts, was the first used. Old settlers tell us how the stone was laboriously got out and carried in a handbarrow to the kiln, and how, when it was filled, two men and a keg of Jamaica rum would on a Monday morning begin together the burning process, for both stone and burners had to be warmed up in those days. When after four or five days burning (according to the quantity of the stone, for some burns more quickly than other kinds) the fire would be allowed to go down, the lime would be removed, and the handbarrow resorted to once more. A tedious process this, and offering sufficient explanation of the smallness of the output in early times. But in 1852, Joseph Armstrong, returning from a visit to Rockland, introduced the square kiln. He built one at Green Head, the first one built in this region. The square kiln, with a capacity of from 400 to 450 barrels, was a great advance on the old method. On an average the daily output of the square kiln would be about double that of the round kiln. It is alleged, though not positively asserted, that about this time the wheelbarrow replaced the ancient hand barrow. At all events, square kilns and better methods of quarrying were gradually adopted. But there were several objections common to the square and round kilns. There was unnecessary waste of time, fuel and material. For after the stone had been placed in the kiln and burned, it was necessary to let the fire go down in order to remove the lime. This involved loss of time and a greater comparative consumption of fuel. The loss in material resulted from the imperfect combustion of the stone at the top of the kiln, which was thus rendered worthless. The step in advance which obviated all these difficulties at once was the adoption of the perpetual or draw kiln, the first of which made its appearance here in 1878. In it the fire burns continually, the stone going in above and the lime being taken out below without any cessation in the process of combustion. There is no loss of time, the combustion is complete, the output is about double that of the square kiln, and there is a comparative saving of fuel of about one third. A draw kiln will turn out from 100 to 125 barrels per day throughout the season, and there are now 14 of them in this locality. The Lime Kilns Of Today - Here is a list of the draw kilns, with owners, and date of erection: Draw kiln Date W. Lawlor & Son, Brookville 1 1878 Drury Cove Lime Co. 1 1878 Chas. Miller, Pokiok 3 1883 Purdy & Green, Adelaide road 1 1884 J. Hornbrook, Torryburn 1 1884 J. & F. Armstrong, Green Head 1 1886 Armstrong & Co. (now Portland Lime Co.), Pokiok 1 1887 Stetson, Cutler & Co., Indiantown and Glencoe 3 1887 W.D. Morrow, Adelaide road 1 1888 The above dates show the year in which the first draw kiln was erected by each person or firm. More than half of the whole number have been built within the last three years. But there are also a large number of square kilns, a few of which have been built in recent years, as those of Stetson, Cutler & Co., since 1887, but most of them of older date than any of the draw kilns. Here is the list: Square kilns Stetson, Cutler & Co., Indiantown 3 J. & F. Armstrong, Green Head 3 Chas. Miller, Pokiok 2 Drury Cove Lime Co. 2 Randolph & Baker, Randolph 2 Portland Lime Co., Pokiok 1 Purdy & Green, Adelaide road 1 W.D. Morrow, Adelaide road 1 W. Lawlor & Son, Brookville 1 J. Hornbrook, Torryburn 1 Bonnell Bros., Grand Bay 1 Geo. Raines & Son, Randolph 1 ---- Total 19 A number of the above kilns are not operated, and the tendency is to abandon them for the draw kilns. Stetson, Cutler & Co., Chas. Miller and Randolph & Baker, who burn mill wood, operate their square kilns for that purpose, but it is found that this wood supplies the draw kiln just as well. There are still some round kilns in operation. They are as follows: Round kilns Isaac Stevens, South Bay 1 F. Stevens, South Bay 1 Mr. Lowrey, South Bay 1 --- Total 3 The output of these and of the square kilns of Bonnell Bros. and Geo. Raines & Sons, all operating on a very small scale comparatively, is shipped up river for the most part for the supply of Fredericton and other points. New Kilns. - But the industry has not reached its limit of development. Stetson, Cutler & Co., who last year turned out in round numbers about 80,000 barrels, will by July next have two more draw kilns in operation, giving them altogether a capacity of from 600 to 650 barrels per day. This firm only began to operate in the lime business in 1887. Randolph & Baker, who began the erection of a draw kiln last summer, will have it in operation this year. J. & F. Armstrong will also erect another draw kiln this year, and there is every reason to look forward to a continued and prosperous development of the industry for years to come. As the supply of raw material is so abundant, there is practically no limit to the industry except in the supply of fuel or the difficulty of finding a market for the lime. Estimate of the Output. - It is extremely difficult to get at the exact output of all the kilns, but an approximate estimate can be made that will give a fairly accurate idea of the amount. If we suppose the 14 draw kilns now existing to be in uninterrupted operation for a season of 200 days (which is a fair estimate), and average the output at 100 barrels per day each we would have from these alone an output of 280,000 barrels. The output of the square kilns operated last year would probably swell this amount to 350,000 barrels, representing a value at current prices of not less than $200,000. This estimate is not extravagant, for had all the kilns been in operation last year the output would have been very considerably in excess of the amount given above. Men and Materials. - A draw kiln gives direct employment to about 13 men throughout the season of burning. There must, therefore, have been in the vicinity of 300 men directly employed in the kilns in this locality last season. In addition to this there is the employment indirectly furnished to the men who supply wood, to the mills that saw barrel stuff, to the hoop makers, and to the various agencies by which these are placed at the kilns and the product carried to market. The barrel industry is in itself an important one. The cooper work is done at the kilns, but the sawing of staves and heads and the making of hoops in the woods in winter gives a good deal of employment and causes the expenditure of considerable money. A barrel is estimated to cost when completed about 18 or 19 cents. Three hundred and fifty thousand at the lower estimate would cost $63,000 - a very snug sum to be put in circulation by one branch of the industry. Then there is the wood supply. A draw kiln will burn four cords a day. The fact that Stetson, Cutler & Co., Chas. Miller and Randolph & Baker burn mill wood, reduces the estimate for cordwood, but the amount of the latter required is by no means small. Apart from these, probably 10,000 or 12,000 cords were required last season, representing a value of between $20,000 and $25,000. This means a good deal of work for axemen and teams, for train and woodboat. The Markets. - The attempt to gain a footing in the American market had to meet and overcome much prejudice. That the prejudice has been overcome is proved by the wonderful development of the trade as shown in the customs figures already quoted. The New York market, until the last year or two, received the largest shipments, but Boston and adjacent towns now receive large quantities. Maine also affords a market. The Aroostook county is almost wholly supplied and shipments are made to Bangor and other points. Cheaper labor, cheaper wood and much less labor required to quarry the raw material and place it in the kiln enable the operators here to compete successfully with Rockland in the New England market. The lime here is also claimed to be of superior quality. Stetson, Cutler & Co., the Drury Cove Lime Co. export nearly all, and Chas. Miller about two thirds of his entire output. The others export in smaller proportion. The local or maritime trade is of course large. Purdy & Green ship largely to Nova Scotia; J. Hornbrook and W. Lawlor & Son have a large New Brunswick trade, being conveniently situated near the railway. Five-sixths of the output of J. & F. Armstrong, at Green Head, goes outside the province. In connection with the export trade it is worthy of note that, in addition to their lime shipments, Stetson, Cutler & Co. shipped 675 tons of limestone to the state of Maine last year. A bill to increase the duty on lime has been introduced in congress and has passed the senate, but the dealers here are of opinion that it will not become law. It is extremely unlikely that the duty will be raised to a point that will close the New England market to our lime. Rockland, it will be remembered, depends on the provinces for its wood supply. The fact that the firms here are enlarging their business proves their confidence in the permanency of the demand for their product. Comparative Value of the Industry. - It is quite clear, from the facts already given, that the lime business is now an industry which furnishes employment to very many persons, and it is equally clear that there is ample room for its further development. The supply of raw material is practically inexhaustible; there is abundance of wood, and the supply need only therefore be limited by the demand for the product. To realize the value of such an industry to the country it is only necessary to institute a comparison. Take the cotton business, for example: The two St. John factories last year gave employment to a large number of persons and paid out a large amount in wages. But before it was possible to do that the raw material had to be procured. For that purpose - for the mere purchase of raw material for the two factories last year - the sum of $267,665 had to be sent out of the country. The material enters free of duty. Another way of making clear the comparison aimed at is simply to point out that in the coarser manufactured product of the cotton factory nearly half the value is represented by the raw material, for the purchase of which the money goes out of the country. Now in the lime business there is no such expenditure for raw material. The business is wholly centred in the country. Here lies the raw material in immense quantities, adjacent to rail and river. Here is the wood for burning and the material for barrels - even the nails being procurable here. If provincial craft, manned by provincial sailors, convey the product to market, it may be said that the lime business from native quarry to foreign market spends all its money here. And the money is spent. Competition is so keen that large profits are not possible. When the cost of the barrel, of the wood, the wages and the freight are paid out there is not a large margin of profit on a barrel of lime. It would only be with a boom in prices and very large operations that a firm or individual could acquire sudden wealth in the lime business of today. That there is a good working profit the extension of the business proves; but, as before pointed out, the balance is money that goes to the workmen in quarry and kiln and copper shop, in the woods, on the vessels and to the railways. It is all spent in the country. The industry is therefore one that directly or indirectly benefits a great many of our own people. General Notes. - The oldest centre of the industry is that of J. & F. Armstrong at Green Head. A Mr. Dallon began operations there about 1815, with a kiln that would hold perhaps 200 barrels. He was succeeded by a man named Chisholm, who worked in a small way. The demand was small, but Mr. Chisholm made money and was able to purchase a farm on Washademoak. In 1825 Robert Robertson got control of the business. He sold out to Joseph Armstrong and others about 1840. In 1852 the new firm built the first square kiln erected in this locality. In 1854 William Rogers left the firm and began business for himself at the quarry now operated by Purdy & Green. In 1864 George Robertson retired from the firm at Green Head since which time the present firm has carried on the business. The annual output from 1865 to 1886, when a draw kiln was added, was from 13,000 to 15,000 barrels. In 1887 it had gone up to 18,000 barrels, and last year the output was largely in excess of that amount. This year, as before stated, another draw kiln will be erected. Their kilns are on the face of a picturesque bluff overlooking the water. The limestone is conveyed by a short tramway from the quarry to the top of the kiln, and from the bottom the barrels are rolled out on the wharf ready for shipment. No horses are needed in their business. Stetson, Cutler & Co. have to haul the lime for their Indiantown kilns a considerable distance. Purdy & Green have a contract to place the stone at the kilns, and employ four teams hauling all the year round. The latter firm have a steam drill in the quarry, the only one employed here. They estimate their own output last year at 27,000 barrels. Those kilns situated near the river or the I.C.R. have the advantage of position in being able to get their wood and ship their product at less expense for hauling. Of course the first remark does not apply to those kilns burning mill wood. The immediate vicinity of the kilns is practically stripped of wood, though Purdy & Green, whose kiln and that of W.D. Morrow are situated inland between the railway and the river, get most of their wood hauled in by teams during the winter. Woodboat and train, however, are the chief vehicles of supply. It will be noted that a large proportion of the operators are Americans. Stetson, Cutler & Co., Chas. Miller and Randolph and Baker are Americans and Americans are interested in the Portland Lime Co. These, as the figures show, control a large share of the business. The price of lime has dropped a good deal of late years. Time was when a cask (about two barrels) cost $3. From 1870 to 1872 the price was about $2.50. In 1877 it had dropped to $1.60. Then after the fire it went up to $1.75. Since then it has gradually come down to the present price, $1.00 per cask, or 60 cents by the barrel. The apparent difference comparatively between cask and barrel is accounted for by the extra cost of making the two barrels instead of one cask. There was more money in lime in the old days, for while the price was high both the labor and wood were much cheaper than at present. But the processes were much slower and were less economical. As an incident showing the opposition to our lime in the American market, Mr. Purdy tells of a man interested in Rockland lime who endeavored to persuade an American dealer in St. John lime that the latter was of poor quality. He asked for a sample to have it analyzed. The dealer quietly sent instead a sample of Rockland lime. He promptly received the information that analysis proved it to be lime of a very poor quality indeed. The alleged analyst of course thought he was talking about the St. John article. After the fire of 1877 a large quantity of Rockland lime was sent here on speculation. The venture was not a complete success, as the last of the lot had to be sold out at auction. The making of hoops for the barrels is quite an industry. They are made on the ground where the material is cut. Several groups of men are now engaged in various parts of the province getting out hoops for this year's supply. The present supply of lime in St. John is by no means large. Dealers say they never have to go outside to seek an order. The difficulty is to keep the supply up to the demand. A draw kiln is said to cost about $2,500.

S.J. Evening Gazette - Apr. 6, 1889 The Dorcas is loading lime for New York."

S. J. Daily Sun - Apr. 27, 1889 More Lime Kilns. - Hayford & Stetson are having two additional lime kilns constructed just above their mills. Messrs. Rankine and Kilpatrick of Rockland, Me., are doing the work."

S.J. Daily Sun - Aug. 3, 1889 More Lime Kilns. - Messrs. Rankine & Kilpatrick, lime kiln builders of Rockland, Me., have completed two more patent draw kilns for Messrs. Stetson, Cutler & Co. This makes six of these kilns that have been built near Indiantown for Stetson, Cutler & Co. by the Rockland men. Four of them are near the mill, so that the wood used in them can easily be obtained. A large shed is being built around the kilns to store the lime in."

Evening Gazette - Aug. 8, 1889 Lime Stone. - Messrs. Stetson & Cutler & Co., have shipped about 60 tons of lime stone by rail this week, to Oldtown, Me."

S.J. Evening Gazette - Dec. 11, 1889 Lime Kilns. - Mr. Charles Miller's lime kilns at Pokiok and the Portland lime company's kilns have been shut down for the season. Messrs. Stetson, Cutler & Co. are at present running only one kiln, but will soon start another and run the two all winter. Messrs. Randolph & Baker will shut down their kilns in a few days. Messrs. Stetson, Cutler & Co. are opening a new quarry at Pokiok."

S.J. Globe - Feb. 19, 1889 Thomas Earle, who was working at the top of the quarry at Miller's lime kiln, Pokiok, on Monday, missed his footing and tumbled down the precipice, a distance of twenty-five feet. When picked up it was thought he was dead, but he soon afterwards recovered consciousness. His right leg was injured at the knee, his face considerably cut, and his head and body bruised. It is thought he will pull through. His escape from death was almost a
Evening Gazette - Jul. 3, 1889 Lime Schooner Burnt. - The schr. Grey Parrot, Capt. O'Connor, from this port for New York, caught fire on the 26th ult. off the coast of Maine near Martinique. The crew were obliged to abandon the vessel and arrived here this afternoon in the schr. Lady Ellen. The Grey Parrot was 97 tons and sailed hence June 21 st with a cargo of 1115 bbls lime and deck load of lumber shipped by Randolph & Baker. The vessel was owned by Hugh Nealis and Capt. O'Connor. She is insured for $1,000 by Mr. Nealis. The Capt. and crew lost all their clothes and barely escaped with

Codes: LIME / IDX_Names: Lime - General;
S.J. Globe - Jul. 30, 1889 A Williams, employed at Messrs. Stetson, Gutler & Co.'s lime kilns, had a narrow escape from being suffocated on Monday. He lost his balance and fell into a lime kiln and was unconscious from the fumes when

Evening Gazette - Jul. 30, 1889 A Williams, an employee of Stetson & Cutler's mill, had a narrow escape from being burned up yesterday morning by falling on a burning lime kiln. He was unloading limestone, and gas from the kiln strangled him, and losing his balance he fell downward. He was picked up and taken to his home on Victoria Street and Dr. March summoned, who rendered medical aid."

Evening Gazette - Jun. 14, 1889 Hurt in a Quarry. - Yesterday afternoon OliverTaylor, one of the quarrymen at Morrow's lime kilns off Adelaide Road fell down the cliff some 25 or 30 feet and received several painful bruises about the body, and also cuts on his face, Dr. McLean dressed the wounds."

Evening Gazette - Jun. 20, 1889 New Lime Kiln. - One of Messrs. Stetson & Cutler's new circular lime kilns has been completed and the work on the other is well advanced. The sheds will be erected at once, so that the new kilns can begin burning in about two weeks."

S.J. Globe - Jun. 29, 1889 Lime Contract. - Messrs. Stetson, Cutler & Co. have contracted to furnish the Penobscot Chemical Fibre company's mill at Great Works, with 45,000 barrels of lime this season. It will be of a superior quality and will come from their St. John kilns, which are producing great quantities. - Bangor Commercial."

Evening Gazette - May 27, 1889 New Kilns. - Work is progressing favorably on Messrs. Stetson, Cutler & Co.'s new lime kilns at Indiantown. These will be draw top kilns built circular inside, as the circular shape allows the fire to get round the stone better than in the square shaped kilns; and the lime is much more evenly burned. These new kilns will be between the present kilns, owned by the firm and their mill."

S.J. Globe - Nov. 2, 1889 Lime Exportation. - The lime business is assuming large proportions. During the three months ending September 30 lime to the value of $44,625 was exported and during last month $11,163, making a total for the four months of $55,788. The value of this trade to our county is far more important than it appears, from the fact that we have the 'raw material' and an abundance of cheap fuel to manufacture the lime."

S.J. Evening Gazette - Nov. 11, 1889 Lime Shipments. - About eight thousand barrels of lime for the United States markets formed the cargoes of some of the vessels that cleared from here today."

S.J. Evening Gazette - Oct. 9, 1889 More Lime Kilns. - It is understood that during the winter 4 or 5 new draw kilns are to be added to the large number now in operation between Indiantown and Green Head. Messrs. Stetson, Cutler & Co. are to build two or three; Randolph & Baker, one, and Mr. Armstrong, one."

S.J. Globe - Oct. 29, 1889 The Lime Business. - Mr. Charles H. Ames, of Boston, is in the city making arrangements to commence work again at the Drury Cove lime kilns. These kilns were formerly managed by the Drury Cove Lime Company, and had only been running a few months when they were closed down, pending the winding up of the estate of Mr. Ames's father, who was the principal stockholder. In conversation with a Globe reporter today, Mr. Ames said that he had bought out the other heirs and intended commencing operations at once. Mr. Acorn, the former superintendent, will manage the works. He is now looking for wood, and if enough can be secured the kiln now at the Cove will be started at burning at once, Mr. Ames said they had the foundation for one new kiln already laid and another will be finished in a few days. The kilns will be built at once. They are to be round and of the most approved pattern and it is expected they will burn from one hundred to one hundred and twenty barrels a day. A cooper shop, sheds and other necessary buildings will also be built. A contract has been given for a million staves for lime barrels. Mr. Ames spoke most hopefully of the prospects for New Brunswick lime. He said he is also engaged in the Rockland trade and it is his opinion the lime from here is of a better quality than that from the other point. If the business turns out as well as he expects, other kilns will be built and better arrangements made for the carrying on of this important industry."

Daily Telegraph - Oct. 30, 1889 Drury Cove Lime Kilns. - The Drury Cove lime kilns, which have not been worked for some time, it is expected will soon be put in operation by Mr. Charles H. Ames, of Boston. Mr. Ames is now here and is making arrangements to have the kilns burning soon. He expects to have two new kilns of the latest pattern in operation

S.J. Evening Gazette - Oct. 30, 1889 Lime Kilns. - The Drury Cove Lime Company are making preparations for building two new draw kilns at their fine quarries, Drury Cove."

S.J. Evening Gazette - Sep. 13, 1889 L'Etang Harbor - This limestone deposit is on the East side of the harbor near the head and is so rich in some places that there is a yield of ninety per cent of lime."

Codes: LIME / IDX_Names: Lime - General;
S.J. Globe - Sep. 25, 1889 The coopers at Messrs. Stetson, Cutler & Co.'s and Miller's lime kilns are now on strike because they have been cut down from 6 to 5 cents per barrel."

S.J. Globe - Sep. 26, 1889 The strike among the coopers in Messrs. Stetson, Cutler & Co.,'s and Chas. Miller's lime kilns still continues. In conversation with a Globe reporter today, Mr. Miller said he did not intend to acede to the coopers' demands, as he considered five cents a barrel good pay, and if the men do not soon resume work he will import others to take their places. When asked if the coopers in his employ could earn sufficient wages to live on by making barrels at five cents a piece, he replied that working nine hours a day, at that rate, they could earn two dollars a day."

Daily Telegraph - Sep. 27, 1889 The Striking Coopers. - The difficulty between the coopers and Messrs. Stetson, Cutler & Co. and Charles Miller still exists. The employers say they will not pay six cents per barrel, the sum demanded, while on the other hand the men refuse to work for five cents per barrel, the figure offered them. To a newspaper reporter, yesterday, Mr. Miller said that working nine hours per day at five cents per barrel the men could make $2 a day. To this statement the men demur. One of them in conversation with a Telegraph reporter last night said that there were one or two men who might be skilful and quick enough to make this wage, but that the ordinary workman could not do it. The majority of the men he said could not make $2 a day at 6 cents per barrel. But while a great number of the men refuse to go to work unless their demand is acceded to, some few have gone back while the places of others are being filled by men who have been employed at other occupations around the kilns. Those who are still out say that the men who went back at the employers' figure were the first to make trouble and they condemn their action in no mild terms. They instance the case of a cooper who is to return to work this morning. At the time the strike took place he was confined to his house by a slight illness, and visited by some of the strikers he approved of the stand which they had taken and avowed his determination to stay out. On being told that his father, who is a cooper, also refused to strike, it is stated that he said his worthy parent was dirty mean. But he has forgiven his determination and is to go to work this morning. At present the kilns are working along under difficulties and it is impossible to tell as yet whether the employers or employees will win. There is some talk of importing men from the states, but this will hardly be resorted to."

Evening Gazette - Apr. 3, 1890 The Lime Industry. - Maine Manufacturers Much Excited. - They Claim That St. John Competition is Ruining Their Business. - A Rockland despatch to the Boston Advertiser says: The people in this city and Rockland, and in fact in all Knox County, are stirred up about the duty on lime. It is a serious, not to say vital, matter to Knox County, whether or not the increasing competition from St. John, N.B., lime burners is to be checked or not. The existing duty, which is practically 3 cents per barrel, is wholly inadequate, and so far as protection from it is concerned, lime might as well be on the free list. The ways and means committee have been made to see the situation in its real light, and they propose to make the duty equivalent to 13 « cents per barrel. What disturbs the people here is the attempt being made by the agents of the St. John concerns in Boston and New York to defeat the proposed increase. The people of Knox County are greatly in earnest about the increased duty. Lime manufacturing, or burning, as it is called, is the only productive industry here, and it is gradually slipping away from the control of Rockland and Rockport manufacturers under existing circumstances. The business employs several hundred hands, and over $3,000,000 is invested in it. The 40 or more firms turn out about 2,000,000 casks per year, and have a capacity greatly in excess of that amount. The campaign against Knox County interests is being made upon an unfair and incorrect basis, and proceeds directly from St. John. It is being said, wherever the statement can hope to influence anyone, that the increase of duty is sought by the manufacturers who are in combination and are already overprotected, and that the object of the increased duty is to permit the combination to increase prices. The circulation of a petition setting forth these untrue statements and protesting against the increase in duty has received many signatures which would not have been granted had the facts been known. A nominal combination has existed for several years. A committee of nine issues a circular from time to time advising as to production. Lime air-slacks and is a perishable commodity, and an over-production is a bad thing, as the experience of 1887 proved. There is no pool, no forfeitures, no penalties and no dividends. The manufacturers have capacity for double the consumption of the whole country, and some arrangement as to production is necessary. The price of lime is nominally maintained by the combination, but not actually, and the claim that prices are now maintained by the combination and are to be increased if the duty is increased is …?... Knox County lime burners are not fighting for higher prices but for existence. Here is the situation. A few years ago parties from Maine began lime burning in St. John. Prior to that time, American lime had been exported to some extent to the provinces, but the American capitalists who had begun business in St. John, including a leading Maine republican, a strong protectionist and member of the state committee, soon revolutionized the business there by the introduction of the best improved American type kilns. Owing to cheap labor and cheap fuel, but chiefly owing to the labor item, because the cost of lime is over 90 per cent in labor, the St. John manufacturers began to compete in all American markets with Knox County lime, and the competition has become so great that, as has been said, the fight of the Knox County manufacturers is for existence. Here is a statement of the cost per barrel of manufacturing lime, and laying it down in Boston, from Knox County and St. John:- Knox County St. John Cask …18 .15 Rock on the kiln … .22 .13 Labor in manufacturing .11 « .06 Fuel …16 .08 Repair of kiln … .03 .02 Freight … .15 .20 Insurance … .01 .01 « Duty ... –.03 — Total ... .86 « .66 « The net price of domestic lime in Boston in cargo lots is 91 cents, which would leave a margin of 4 « cents per barrel to the manufacturers, but as there must be deducted from this 1 « cents for interest, inasmuch as fully six months is required to turn the money, there is really left a margin of only 3 cents. This would be $60,000 on a production of 3,000,000 casks, equivalent to 3 per cent on the $3,000,000 invested. This is the exorbitant profit which people are being told about in order to defeat the proposed increase of duty! It will be observed that the cost of St. John's lime in Boston, duty paid is 15 cents less than Knox County lime. The proposed new duty is only 13 « cents, leaving to the St. John manufacturers still an advantage of 4 « cents, which must be overcome in some way by the Rockland lime burners. To put the situation in a nutshell, the cost of lime must be decreased at least 4 « cents in Knox County, even if the new duty is levied, and if nothing is done the industry will be destroyed. This is why Knox County people are excited over the efforts of St. John parties, through their

Codes: LIME / IDX_Names: Lime - General;

S.J. Daily Sun - Apr. 10, 1890 The Lime Duty. - A Washington despatch of the 7th inst. says: A.F. Crockett and H.L. Shepherd, representing the Maine limeburners, were before the ways and means committee today and set forth the necessity for more protection than has been given under the law now in force. The present duty amounts to about three cents a cask. This is not enough to enable them to compete with the New Brunswick lime burners, who get labor for from $1 to $1.25 per day, while in Knox County the rate of wages is from $2 to $2.50. For the last three years the Knox county burners have been losing business at the rate of a hundred thousand barrels a year. There are $3,000,000 invested in the business in Maine, and Messrs. Crockett and Shepherd emphasized the claims of the industry to a protection of six cents a hundred pounds, about 13 1/2 cents a barrel. The Maine men are not here alone. There are lime burners in 22 states, and all of them are working together. The New York men came this afternoon. The ways and means committee, as Gov. Dingley and others of the committee gave assurances, will stick to the recommendation for the protection asked. The danger is when the tariff comes into the house. There has been quite a movement for free lime in some of the Massachusetts cities and many petitions have come in from these sources."

St. Croix Courier - Dec. 4, 1890 and S.J. Globe - Dec. 5, 1890 St. George. - Mr. J. Sutton, our enterprising druggist, has bought the White property at LeTang and intends to commence burning lime early in the spring. It is a very large and valuable property and includes nearly all the wharf privileges of the beautiful harbor which, some day in the near future, will take the precedence, as a winter port and terminus, of both St. John and St. Andrews. We trust Mr. Clark may demonstrate the value of his property as speedily as possible."

S.J. Evening Gazette - Dec. 15, 1890 To Load Lime. - Schooner Alberta has been chartered to load lime here for New York. She is a schooner of about 600 tons register and belongs to Windsor. She cleared from New York for this port on

S.J. Globe - Feb. 1, 1890 The Lime Trade. - The value of lime exported during the month of January was $4,151. In January, 1889, the value of lime exported was $1,673, and in 1888, the value was $1,077. The lime trade is a growing industry, and should be encouraged."

S.J. Daily Sun - Feb. 6, 1890 The Lime Business. - The Drury Cove Lime company are building two new draw kilns at Drury cove. They have one draw kiln and two old-fashioned kilns which will enable them to manufacture a great quantity of lime this year. The company will have a shed 100x250 feet in which to store their lime, and the I.C.R. authorities have promised to build a siding leading to their kilns. This will give them much better facilities than they now have. Chas. H. Ames of Boston, the principal man of the company, told the Sun reporter yesterday that they would manufacture about

Chignecto Post - Feb. 6, 1890 The lime industry of St. John is a growing one. In January 1888, $1,078 worth was exported from the city. In 1889, $1,673, and this year the exports reached $4,151. This is a small fraction of what was produced."

S.J. Daily Sun - Feb. 25, 1890 Parliament. - The Duty on Lime to be Reduced, as Asked for by New Brunswick Members. - (Special to the Sun). - Ottawa, Feb. 24. - ... The application of Mr. Skinner to the government in regard to diminishing the duty on lime has been favorably entertained. It has been decided therefore to decrease the duty on the article to 20 cents per barrel to 10 cents per barrel, thereby making the duty the same as the American. This important industry has largely increased of late years in the Dominion, New Brunswick alone manufacturing over 300,000 barrels per annum, and owing to the fact that in Rockland the lime burners have agitated to have the authorities at Washington increase this duty to the same figure as the Dominion government were charging the American article imported into the Dominion, the government have deemed it a wise policy to lower duty as above mentioned."

S.J. Globe - Jul. 3, 1890 Lime to the value of $17,930 was exported during the month of June, against $17,082 exported during the same month last year. For the quarter ending June 30, 1890, the value of lime exported was $43,988 and for the quarter ending June 30, 1889, the value was $45,297."

S.J. Daily Sun - Jun. 3, 1890 The value of lime exported during the month of May was $16,254, against $14,972 in the same period last year, and $9,679 in May, 1888."

S.J. Globe - Mar. 4, 1890 A Rockland Complaint. - Bangor News. - The Rockland men complain of the competition of St. John lime in Boston and New York markets. They say 225,000 casks of St. John lime were sold in the States in 1888, and that at the present rate of duty, ten per cent ad valorum, and the lime being invoiced at thirty-five cents per cask, the actual duty paid was only three and one half cents per cask. They further claim that they pay $5.52 on an average for the same amount of wood that cost the St. John lime burners $2 to $2.25. They also average that to quarry and place their lime rock at the kiln costs twenty-two cents per cask, against ten cents in St. John, and that labor is twenty-five per

Codes: LIME / IDX_Names: Lime - General;

S.J. Evening Gazette - Mar. 21, 1890 The Lime Kilns are being started again for the season's burning, and the output this year will probably be even larger than that of last year. Messrs. Stetson, Cutler & Co., already have two of their draw kilns at Indiantown in operation and one at Glencoe. Mr. Charles Miller has all of his large kilns at Pokiok burning, and one at Drury Cove has been started."

Daily Telegraph - Mar. 22, 1890 The Lime Duty. - Private despatches received today state that the house of representatives tariff committee recommend that the duty on lime be increased to 6 cents per cwt., equivalent to about 12 cents per bbl. The duty at present is about 3 cents per bbl. - [Globe 21st."

S.J. Daily Sun - Mar. 26, 1890 The Tax on Lime. - A petition in opposition tothe proposed increase in the duty on lime is in circulation in and around this city, and is receiving a large number of signatures from those representing the building, contracting and manufacturing interests. The petition sets forth that considerable quantities of lime are now imported from Canada; that the rest, and by far the greater part of the lime sold in this market, comes from the vicinity of Rockland, Me., the price of which is controlled by a combination which includes nearly all of the Rockland manufacturers. The only competition in lime, so far as this section of the country is concerned, is that which comes from Canada. The present duty on lime is 10 per cent., which, with the higher freight charges which Canadian lime has to pay, amounts to a protection in the gross of about 27 per cent. ad valorem. If this is increased, our builders have good reason to believe that the advantage of the Rockland lime combination to advance its price so as to secure the entire benefit of the increased tax. To this those interested - and the number includes all of those who own or occupy buildings - should enter a protest. The building trade is first concerned, from master builders to masons, carpenters, printers, etc., for everything which unnecessarily adds to the cost of construction tends to decease the amount of construction. -[Boston Herald"

Evening Gazette - Nov. 4, 1890 The Manufacture of Iron in St. John. - At a meeting of the Board of Trade yesterday, among other things the facilities offered by this city and its surroundings for the manufacture of charcoal iron were discussed. Among others who were present were Major Markham and Messrs. G.F. Matthew and Edward Jack. It seems that application was made last spring by certain parties feeling the necessity for information of a practical character respecting the iron ores of New Brunswick and the shores of the Bay of Fundy in Nova Scotia, to the Hon. Mr. Dewdney for the employment of W.E. Sjostedt, M.E., chemist and metallurgist, a graduateof the School of Mines in Stockholm, in Sweden. This gentleman was lately superintendent of the Katahdin iron works, where he has been for five years, the five preceeding years having been spent by him in making charcoal iron in Alabama, for the purpose of examining these deposits as well as of making a report of a practical character on the quality and extent of these ores and the cost of their manufacture. Mr. Dewdney declined to recommend the appropriation for such a purpose. Gentlemen making the application, however, determined to pay for Mr. Sjostedt's services themselves, and are now in possession of a most exhaustive and valuable report from him. At the meeting of the Board of Trade, above referred to, Mr. Jack stated that, as the result of Mr. Sjostedt's investigations by using ores from the shores of the Bay of Fundy, and fluxes from Saint John, in the shape of limestone, and also by using charcoal made from hardwood on the New Brunswick railway, charcoal pig iron can be made here for $15.50 per ton. This is based on a bonus of $2 per ton, which is granted by the Dominion, and the estimate includes an allowance of $1 per ton for depreciation of plant, and for repairs. He says, that iron can be made in Saint John equal to the best Swedish by a proper preparation and mixture of ores; known to occur in New Brunswick, and on the shores of the Bay of Fundy. One of the speakers, at this meeting, called the attention of the Board of Trade to the necessity that there was for a careful examination of the iron, coal and other mineral deposits in New Brunswick, by a practical man having the necessary theoretical knowledge to determine as well the chemical constitutions, as the economic uses to which these minerals could be put, and all other information necessary for the miner, or manufacturer's purposes. The result of these examinations should be embodied in a report, which should be accompanied by a map on a sufficiently large scale to enable the localities of all ores and minerals to be marked thereon in such a manner as would readily strike the eye."

Evening Gazette - Nov. 4, 1890 Board of Trade. - The Possibility of Making St. John a Great Iron Manufacturing Centre Discussed. - At the special meeting of the Board of Trade held yesterday afternoon, the possibility of making St. John a great iron manufacturing centre was discussed. George Robertson said that having coal, iron and limestone within easy reach he was sure there was a good reason to believe that this city would in time become the centre of a great iron shipbuilding industry. Edward Jack, C.E., speaking of a bog iron ore deposit below Fredericton, said it would make good car wheel iron and could be delivered at St. John for about $2 to $2.50 per ton. It was better than that at Woodstock or Nictaux and probably as good as Katahdin. There was adeposit of magnetite on Bartholomew's river of probable great value, and a less valuable one in Gloucester county. But the most important statement Mr. Jack had to make was that using iron ores from the Bay of Fundy, fluxes from St. John, and charcoal from points along the N.B. Railway, charcoal pig iron could be manufactured here for $15.50 per ton. This allowed $1 for depreciation of plant and for repairs, and including the bounty of $2. And by mixing ores that are known to exist the product equal the best Swedish. William Greig said that there would be money in it for ordinary iron at Mr. Jack's figures. Mr. Markham remarked that ordinary pig iron cost $21 a ton. G.F. Matthew said there are fair indications of an iron deposit at Quispamsis. There are some largeboulders on the surface and exploration would probably reveal a bed of ore lower down. As to limestone, St. John had great deposits. There were also easy facilities for securing coal, and while perhaps not as favorably situated as Londonderry for the reduction of ores, the business could probably be carried on successfully. St. John was a good place for the establishment of smelting furnaces for the second process in iron manufacture. Andrew Cushing believed St. John had fine facilities for iron manufacture. As a seaport we had fine chances for securing scrap iron now so much used in manufacture. A. Markham showed that St. John was a most desirable place for carrying on the manufacture of iron."

Codes: LIME / IDX_Names: Lime - General;
Moncton Daily Times - Nov. 4, 1890 Says the Globe: The value of lime exported (from S.J.) during the month of October was $10.,045."

S.J. Daily Sun - Nov. 11, 1890 The lumber cut by Stetson, Cutler & Co. this season will be in the vicinity of 30,000,000 feet of spruce and pine lumber and 30,000,000 shingles. In their two mills and ten lime kilns this firm employ about 450

Evening Gazette - Nov. 22, 1890 The Lime On Fire. - The schooner Second arrived at Eatonville, N.S., yesterday morning with a bad fire making its way through her. The Second left St. John on Thursday for Parrsboro with the intention, however, of calling at several ports. She had a large cargo, including 150 barrels of lime shipped by the Messrs.

Armstrong. The lime caught fire and Capt. Smith stated in his telegram that the cargo was destroyed and that the vessel would be a total loss. The Second had on board a large consignment of goods shipped by J. Willard Smith to the Messrs. Eaton of Eatonville. The vessel is owned by Capt. Smith, and it is said is not insured. There was no insurance on the

Evening Gazette - Nov. 24, 1890 The Lime Burners. - A Good Year's Work Notwithstanding Low Prices. - The lime burning season is about over for the year, and all but a few of the large number of kilns in the vicinity of the city have been shut down for the winter. The prices of lime this year in the United States markets have been lower than usual owing to the demand for that article being smaller. But St. John lime has won a name for itself and, despite the opposition to its use from some quarters, those who want lime of first class quality now look for the St. John article. The export of lime from St. John since the business began to assume large proportions has gone mostly to the New York market, and with the exception of small shipments by rail the New England states got very little of it. This season, however, there has been a large increase in the shipments to the eastern states and quite a footing has been gained in the Boston markets. The business on the whole, however, has not grown quite as rapidly as has been the case in some recent years. The lime exports from St. John to the United States market during the year from the 1st of November 1887 to the same date in 1888 were valued at $99,080. From Nov. 1st, 1888 to Nov. 1st., 1889, $137,877 worth of lime was exported showing an increase in that year over the previous one of $38,687. This year ending Nov. 1st. the total lime export was valued at $146,447. Owing to the low prices and the dull condition of the market many persons had an idea that this year's shipments would be smaller than those of last but these figures show an increase of $8,570. In anticipation of the increased duty on lime under the McKinley bill the shipments were heavier than usual, $48,867 worth having been shipped in the July, August and September quarters, or over $400 worth more than was reported during the same months of the year previous, and $8000 worth more than in July, August and September of 1888. When the McKinley bill went into effect, putting a duty of 6 cents per hundred pounds on lime, equal to about 13 or 14 cents per barrel, there was a slight falling off in the shipments, the amount for October being $10,049 worth this year as compared with $11,163 worth in October of last year. It is not known just to what extent this increased duty will affect the business, but there are those who think that what has been the case in regard to potatoes will apply to the lime business, as well. When the Yankees want good potatoes and haven't enough of them on their own side of the line they will come to this side for them, pay the market price in their own market. This is being done right along this fall. But others contend that the Americans should be met with retaliation in the way of an export duty on wood. Said a lime burner the other day, Put a good export duty on the kiln wood taken to Rockland. They must have it. Then we would have the best of it in spite of them."

S.J. Evening Gazette - Oct. 17, 1890 Mckinley Hard on the Lime Burners. - The duty on lime exported to the United States having been increased to about 14 cents per barrel under the McKinley tariff will affect our lime burners here to a considerable degree. To compete for the trade they have found it necessary to lessen expenses by cutting down the wages of the men employed about the kilns 15 cents a day. A reduction of 1 cent a barrel has been made in the wages of

S.J. Evening Gazette - Oct. 18, 1890 Lime Export. - The amount of lime exported from St. John to the United States market this year shows quite an increase over last year's export. From October 1888 to the same date 1889 228,633 barrels, valued at $114,316.38 was exported; while from October 1889 to the 1st of the present month, the amount was about 315,339 barrels, or $157,669.60 worth, showing an increase in the export of this article of 86,706 barrels or

S.J. Daily Sun - Sep. 17, 1890 The lime business. - This has been an off year in lime shipments to the States. The strikes of brick layers, stone masons, brick makers and carpenters paralyzed the building business, and contracts that were let had to be abandoned till next year. There is not much anticipation of any large shipments during the rest of the season."

Evening Gazette - Sep. 17, 1890 On Kennebecasis Bay. - ... Near Chapel Grove, about midway between Summerville and Moss Glen, a little brook wimples down from the hills, crosses the road and empties into the bay. Near its banks and close by the road stand the ruins of a kiln where lime was burned for the use of the neighborhood fifty or sixty years ago. But to this day, it is said, of a summer night when the clocks are striking twelve, blue flames are seen rising over the heap of stones where the kiln formerly stood, and the ghosts of the lime burners of more than a generation ago are seen and heard, busy at their work, while one of a facetious turn of mind walks up and down the road with his head under his arm, winking with blazing eyes at any belated wayfarer that he may chance to meet in his saunterings. ..."

Codes: LIME / IDX_Names: Lime - General;

S.J. Daily Sun - Apr. 4, 1891 Lime Business. - A large draw kiln is being built near St. George by Mr. Jackson of this city and J. Sutton Clark which will be put in operation very soon. There is an abundant supply of limestone there and the manufacturers have an excellent chance to ship their lime by vessel. A wharf is now being put up with sheds in which to store the lime. This will be a big thing for the place."

Evening Gazette - Apr. 9, 1891 Lime Kilns Closing Down. - Some of the Indiantown lime kilns are being shut down, in consequence of the low price of lime in the States."

Evening Gazette - Aug. 3, 1891 A Dynamite Accident. - A young son of John Doherty of Bridge Street found some dynamite on Friday near Messrs. Stetson, Cutler & Co.'s lime kilns. He and another boy exploded it by pounding it with stones and both are now suffering considerable from the injuries received."

S.J. Globe - Aug. 22, 1891 The Lime Business. - [Bangor News]. - About 20,000 barrels of Maine lime were received in New York the past week, and were disposed of without any difficulty whatever. The demand for it was very good, and no trouble was experienced in obtaining full prices. Some 5,000 barrels of St. John lime also arrived and were sold quickly at ruling prices. Very little Maine lime is on the way. Stocks in the Rockland, Rockport, and Thomaston districts are so light that vessels are obliged to wait until the lime is burned. Ruling quotations are as follows: Rockland, common and finishing, $1 per bbl. State lime (Glen Falls) 90c. St. John lime, common, 85 c.; finishing $1."

St. Andrews Beacon - Jan. 22, 1891 and St. Croix Courier - Jan. 29, 1891 At the Lime Kilns.- Mr. J. Sutton Clark, of St.George, who recently acquired the valuable lime property at Letang Harbor, is making preparations for developing it on a large scale. He has contracted with Mr. Wm. Austin, of St. George, to erect an immense storehouse, as well as a number of buildings for workmen, and he is also arranging for placing a number of modern kilns at the quarry. Mr. Clark's enterprise is deserving of success, and we have no doubt that he will succeed."

S.J. Globe - Jul. 28, 1891 Probate Court. - Administration of the estate of Maynard Sumner, late of Rockland, in the State of Maine, banker, was this day granted by the probate court of the county of Saint John. The application for letters of administration was made in order to complete the title to the Drury Cove Lime Company property. Mr. Arthur C. Fairweather is acting as solicitor for the estate and for the purchasers of the property."

Evening Gazette - Nov. 27, 1891 The lime business has been very dull during the past season and a number of the kilns have not been used at all. The few above Indiantown which were in operation are now closing down for the season. Messrs. Stetson, Cutler & Co's kilns have been shut down for a week or two. Mr. Miller's and the Green Head kilns have been shut down within the past few days, and Messrs. Randolph & Baker's will probably stop burning this week."

Evening Gazette - Sep. 18, 1891 The Lime Business. - A slight improvement is noted in the lime business and a larger number of the kilns about St. John are burning than at any other time of the year. Besides the kilns at Drury Cove, Torryburn and those of Messrs. Purdy & Green of Adelaide Road, there are seven of the large kilns on the river banks above Indiantown now in operation. Messrs. Stetson, Cutler & Co. are running two, Mr. Charles Miller two, Messrs. Randolph & Baker two, and Messrs. Armstrong at Green Head one. The improvement in the business is principally due to

St. Andrews Beacon - Sep. 24, 1891 The Lime Kilns, Letang ... thanks to the enterprise of Messrs Clark & Jackson, is becoming quite a thriving place. They have erected a number of buildings, and are fitting up their kilns with the most approved appliances. They contemplate having telephone communication with St. George."

S.J. Daily Sun - Jul. 30, 1892 A vessel is discharging one thousand tons of Irish limestone at Chatham for the pulp mill. It is said that New Brunswick limestone will not work well in pulp making, though some chemists say the fault lies with the pulp mill plant."

Daily Telegraph - May 3, 1892 At the Green Head lime kiln there is a cave through the lime rock about 100 yards long and about 6x4 feet, in the centre of which is a cavern about 20 feet square. The cave is a watercourse and was discovered in 1845. This kiln has been worked about 60 years. It is at present managed by J. & F. Armstrong, and they yearly sent about 30,000 bbls. of lime over the maritime provinces. They employ about 15 men at the kiln, and are at work from

Codes: LIME / IDX_Names: Lime - General;
Daily Sun - Apr. 12, 1893 Brookville Lime Kilns. - The Property in the Possession of Messrs. Morse and Rokes, of Maine. - McKinlay Law Against the Business, but the Lime Burners Hope for Relief. - Yesterday a Sun reporter boarded the Halifax morning express and went as far as Brookville, and having two or three hours to spare walked over to the Drury Cove lime kilns, which are situated about a quarter of a mile north of the I.C.R. The scenery in and around the kilns is quite grand. The lime rock appears to be unlimited. Hills of nearly pure rock rise from 150 to perhaps 250 feet above the level and cover a very large area, so practically speaking these kilns are inexhaustible. Springs of clear, pure water can be found almost anywhere, and the Sun man was informed that persons who have not only never been ill, but have actually never had a serious cold. The Drury Cove property, which embraces the lime kilns, a number of residences, several shops and buildings and a large tract of land, is now owned by Messrs. Morse and Rokes. Both gentlemen are natives of Knox county, Maine, and took possession of the Drury Cove kilns nearly two years ago. Previous to this date these kilns had several owners, having been first opened up in 1864 by Sheriff Drury. After carrying on the business for a few years, Mr. Drury sold out to his brother Charles. Shortly after this it was leased by a Mr. Gillmore. About the year 1868 E.L. Jewett purchased the property and erected a large steam mill on what is now called Drury Cove, an arm of the Kennebecasis River. This cove is several hundred yards broad and the depth of the water is sufficient for a schooner of 100 tons burden. In 1881 the mill was destroyed by fire. It was not again rebuilt and the kilns were not worked to any extent for several years. Mr. Rokes, the senior member of the firm, greeted the Sun reporter very cordially and seemed very willing to talk about his business. In answer to an enquiry, Mr. Rokes said their business was not at present yielding

good returns. They being a new firm, their local trade was very small. In fact, it was not their intention to [illegible] those who supply the local trade; they wish to ship to Boston, but on account of the McKinley Bill they are unable to do so and receive even a fair profit. The duty before the McKinley bill came into force was about three cents a barrel, and the freight on an average about twenty cents per barrel. Now the freight is just the same, but the duty for a single barrel is a fraction over thirteen cents. The lime sells for from seventy to eighty cents a barrel, so it can easily be seen that the manufacturer's profit is, to say the least, very small. If the American government would reduce the duty on lime just one half, making it seven cents on the barrel, we could make our business pay, remarked Mr. Rokes. We could make it pay with a profit of five cents on the barrel and we would open several other kilns at once. An ordinary kiln will turn out over one hundred and fifty barrels per day. At five cents a barrel net, it will be seen that the profits from several kilns would be large. Mr. Rokes read several letters from American gentlemen, all testifying to the excellence of Drury Cove lime. The Sun has learned that the lime burners in Rockland, Rockford, Thomaston and several other towns within proximity of those mentioned, used last year not less than 70,000 cords of maritime provinces wood to burn their lime. The greater part of this was cut in New Brunswick and sold last year as low as $3.50 per cord, although it has sold for $4.50. The lime burners can do better by buying our wood at $4.50, and even at $4.75, than by patronizing their own wood market. This wood, of course, goes into the states free of duty. It has been suggested to the Sun that a duty of say $1 might be imposed on this wood, and thus the price of American lime would rise about five cents per barrel. This would give the maritime provinces men a chance. Mr. Rokes informed the Sun reporter that if the present duty were removed, even in part, it was their intention to go into the business on a large scale. They would erect a stave factory, a saw, shingle and lath mill. They could easily secure sufficient lumber as it came down the St. John river, as do other mill owners. They would ship by schooner, which could load at their wharves without any difficulty. With a good market, a great industry could be worked up here. It is stated that a session of Congress is likely to be held in September when Mr. Rokes thinks something may be done in the way of removing obstacles in the way of the lime business. The firm is making

S.J. Daily Sun - Apr. 21, 1893 Stetson, Cutler & Co. .... They have seven lime kilns in the vicinity, only one of which is being utilized. They burn this with wood from the mill. It would not pay them to but cord wood to burn the others."

S.J. Daily Sun - Dec. 2, 1893 The Boston men who undertake to syndicate the limestone district of the maritime provinces have their work cut out for them. The St. John limestone beds are probably the most available, but these alone are too extensive to be easily brought or kept into one organization. If a syndicate acquired the whole block on the east bank from Indiantown to the Kennebecasis and up the latter river for ten or even twenty miles, including the whole lime region to the Bay of Fundy, it would have a great property and would have spent much money. But on the other bank of the St. John, properties would be left probably equally extensive and productive. There are large deposits on the other side of the Kennebecasis. There is lime in Kings, Victoria, Charlotte and Albert counties, and on the north shore. Cape Breton has lime in each of its four counties. Pictou, Colchester and half the counties of Nova Scotia are partly made of limestone. There is, however, no doubt that the lime at the mouth of the St. John river is the most conveniently located. It is indeed impossible to conceive of a greater combination of advantages for the production of lime for export in barrels. The rock is brought by gravitation to the kiln, which is supplied by the cheapest fuel in the world, and is situated where the produce may be loaded directly on the ship for export. Many of the quarries are so situated that the produce is carried by its own weight all the way from its natural bed to the hold of the ship."

St. Andrews Beacon - Dec. 7, 1893 St. George.- It is rumored that in view of limebeing on the free list, Clark and Jackson, of Letang, will in the near future open up their quarries, the lime of which is said to be of good quality and unlimited in
St. Andrews Beacon - Dec. 7, 1893 A Boston syndicate are said to be after the limestone quarries of the Maritime

Codes: LIME / IDX_Names: Lime - General;
St. Croix Courier - Jan. 26, 1893 and St. Andrews Beacon - Jan. 26, 1893 St. George.- We heard yesterday of the death of James White, Esq., of Gardiner, Me. He used to own the Lime Kilns at Letang Harbor, and was well and favorably known in St. George. He was a brother of Mrs. Benjamin Randall, who formerly lived here."

S.J. Daily Sun - Jun. 7, 1893 St. John Limestone Good Enough. - It has been stated in connection with the talked of smelting works that the proposal is to bring limestone as well as the ores from Nova Scotia. When Ernest Sjostedt was superintendent of the Katahdin Iron Works, Me., he took all his limestone for fluxes from St. John. Much of the St. John limestone is of excellent quality for the purpose, some of it running as high as 98 per cent. of carbon to lime."

Evening Gazette - Mar. 11, 1893 Struck by a Stone. - John Sarah, a workman in Messrs. Purdy and Green's lime quarry at Indiantown, received a serious scalp wound yesterday afternoon by being struck by a flying stone from a blast. Dr. McInerney rendered medical aid."

Evening Gazette - Mar. 29, 1893 Lime Kiln. - Purdy & Green's lime kiln situated near Adelaide road, is having the old wooden covering replaced by a new iron topping with smoke-stack attached. This is one of the latest inventions and will greatly facilitate the work of the kiln."

S.J. Daily Sun - Nov. 28, 1893 Lime, St. John's Greatest Hope. - To The Editor of the Sun: Sir. - A correspondent of the Evening Globe of the 22nd calls attention to a subject that has not received the notice its importance demands. The correspondent is J.M. Taylor, and the Globe, in its characteristic spirit, has dammed his effort with faint commendation and a rigamarole of preface, ending with the observation: One difficulty about this kind of thing is that no one knows, once it begins, where it will stop. This reference is to what it is pleased to call reprisals against the lime manufacturers of Rockland. Changing a word in its correspondent's first sentence, it makes him talk about free trade instead of fair trade; and, dropping a figure from the rate of duty established by the McKinley bill, it breaks the point of the next sentence. These last, we may suppose, are printer's errors, but they come in very awkwardly, to put it mildly. But to the subject. It would seem a ludicrous statement to most people to say that the lime business may some day be of more importance in St. John than the lumber business; but nevertheless it is a very live fact. The one was an infant industry before the passage of the McKinley bill, but doubling its proportions year by year, and in such case one does not need a prophet's eye to see an immense future while the other is a waning industry, that must grow less with a sickening influence if there is no other industry to take its place. After the passage of the McKinley bill one firm in St. John dropped its payrolls from 800 to 1,000 men who had been employed in connection with the lime trade. business; in a few years there might easily have been half a dozen firms pushing the with equal energy, meaning an army of 5,000 to 6,000 men. I think it will be found that the Rockland lime burners got the duty raised from 4c. to 14c. per barrel to shut out St. John lime. They succeeded, and are laughing over our discomfiture. But have we the remedy? Yes. The Rockland people get five-sixth of their cordwood from Canada. They have killed out the Canadian demand for that kind of wood, and now they but it at pretty nearly any price they like. It is sacrificed to them, giving them an added advantage over any of our people who might try to enter their market. The added duty on 25 bbls. of lime amounts to $2.50, and it takes just about a cord of wood to burn 25 bbls.; but an export duty of even $1.50 per cord would give our people a chance and bring the Rockland people to terms. What can be said against it? It is a matter that does not probably affect any part of Canada except New Brunswick and Nova Scotia and no part of the United States but the district of Maine about Rockland. Were our kilns in operation again those having cordwood to sell could more easily dispose of it near home, and the competition would probably raise the price. Our coasters can make more money in carrying lime to New York and Boston than in carrying cordwood to Rockland. As to the bugbear of reprisals , what is there in it? The United States is going to make its tariff to suit itself. In this we have the whip hand, and our members should see that this matter is not lightly shelved. Our government, which is supposed to work for the greatest good to the greatest number of its own subjects, should at least give this the most careful consideration. It may be well to put kilnwood in a category by itself; pulpwood and ordinary fire wood may be discussed on their own merits. J.S. Armstrong, C.E. Nov. 25"

Gazette - Nov. 30, 1893 The Lime Business. - Should the duty be taken off lime in the United States there is no question that a great revival of that trade will take place here. The lime burners in St. John are hopeful that the bill will pass the Senate. But should the bill become law the shipments for some time to come will not be large. This is owing to the distressed state of the market in New York and other places. As it is, the business in Rockland and Rockport, Me., is almost at a standstill, many of the kilns are not burning. Another feature of the business is the demand for kiln wood, of which the exports to the American market have been very large during the past few years. Should the kilns in St. John be burning, a large portion of the kiln wood would be consumed here. Cargoes exported to Rockland and adjacent ports lately have brought very small returns both for vessel freight and to the shipper of the wood. Some of our lime burners think that should the trade revive, the price of lime will be very low as strong competition will be met by the American

S.J. Daily Sun - Sep. 9, 1893 The Lime Industry. - A gentleman engaged in the manufacture of lime told a Sun reporter yesterday that his sales in the provinces had been larger this year than last. He also said the price obtainable for lime in the United States at present was lower than early in the season."

Codes: LIME / IDX_Names: Lime - General;
St. Andrews Beacon - Aug. 2, 1894 Sketches at Magaguadavic.- ....L'Etang ....On the site of the town there are extensive beds of limestone, which only required McKinleyism to be wiped away in order to give new life to that magnificent sheet of water, L'Etang Harbor, destined by nature some day to be the Sebastapol of the Bay of Fundy. In a sketch of the harbor published by the Telegraph is a view of the lime rocks; in the distance is Frye's Island embracing 900 acres. The highest point is Cailiff, 183 feet above the level of the sea; to the left is part of Bliss Harbor, with western end of McCann's Island, which belongs to the British government. ...."

S.J. Daily Sun - Aug. 7, 1894Light Demand for Lime. - Vessels taking lime to New York find it almost impossible to get rid of their cargoes, the demand for lime being light. A St. John vessel with lime on board has been detained there three weeks, while Rockland cargoes remain on vessels which arrived there six or seven weeks since."

S.J. Daily Sun - Aug. 7, 1894 and Moncton Daily Times - Aug. 8, 1894The Lime Business. - The lime business in the United States is dead. In these provinces it is different. J. Willard Smith told a Sun reporter yesterday that he had sold 6,000 barrels of lime to people in New Brunswick and Nova Scotia this year. If this means anything it means that building operations on this side of the line are not as near at a stand still as they are in the great republic."

S.J. Daily Sun - Jan. 16, 1894 The tariff debate at Washington is becoming personal. Congressman Payne of New York has been charging the democratic tariff framers with personal interest. He charged that the duty on lime had been reduced at the request of Hon. Frank Jones of Portsmouth, N.H., a former member of the democratic national committee, who happened to be one of those patriotic American citizens who had invested in the town of St. John, N.B., a lime producing town. He had actually told the committee that the tariff of 1890 had proved disastrous to his town of St. John, and has been a boon to the town of Rockland and other localities in Maine."

S.J. Gazette - Mar. 10, 1894 Another Started. - Mr. Charles Miller has started his lime kiln at Pokiok."

S.J. Daily Sun - Mar. 23, 1894The Lime Duty. - As the Wilson bill now stands the duty on lime is placed at fifteen per cent. on the value of lime and package. This is something higher than the rate which prevailed before the McKinley bill, and is much lower than the present rate. If the tariff is adopted it will afford to the United States lime producers a reasonable protection, and will enable the producers on the St. John river to enter into the competition. This will be for the benefit of the building trades in the Atlantic cities, which under the present conditions are practically under a monopoly. The present tariff is some forty to fifty per cent. on the value of the article at the point of shipment, which is a very large duty to levy on goods of primary production, that are also raw material for building. The proposed reduction would not crush out the Rockland industries, but would leave the Maine producer a substantial advantage. From the point of view of the Canadian exporter a reasonable duty on lime will not be distasteful. Such a tariff would have some guarantee of permanence, and would prevent too great a rush of speculators into a business which, like many others, is capable of being overdone. But if the senate should reduce the lime duty to ten per cent. or make lime free altogether the consumer would obtain his material much cheaper, for competition would soon cut the profits down to the living point."

N.B. Reporter - May 28, 1894 A woodboat load of limestone for the Presbyterian church arrived on Monday."

S.J. Daily Sun - Nov. 21, 1894 The majority of the limeburning establishments in the vicinity of St. John have closed down for the season. W.D. Morrow says the season has been a fair one, all things considered. His sales have been very large, but prices have been rather low."

Carleton Sentinel - Oct. 6, 1894 Tobique. - There is a large quantity of limestone in this vicinity. This week Mr. Chas. Harris is burning a large kiln which is expected to produce several hundred barrels. The illumination it makes in the evenings renders it very attractive to the young people of the neighborhood. LAZURUS"

Daily Sun - Jul. 26, 1896 I have sold 7,651 csaks of lime up to date, said J.W. Smith to a Sun man yesterday, or nearly 2,000 casks over and above my sales for the same period last year. And now I have orders that I cannot fill. Not a single cask of it went to the United States, it was all sold in the maritime provinces. Miller & Morrow were the burners."

Codes: LIME / IDX_Names: Lime - General;
S.J. Daily Sun - Oct. 4, 1895 Green Head Lime. - Wm. Murdoch, C.E., has on exhibition several barrels of lime from the celebrated Green Head kilns on the St. John river. When Claude Latour constructed fortifications near Annapolis Royal about the year 1630 the lime he used was the product of the Narrows, and from this neighborhood lime was shipped to Boston by Jas. Simonds before the declaration of American independence. The quarries on both sides of the river have been worked ever since, and the towering cliffs of limestone give promise of boundless resources for ages to come. This lime is considered to be superior in many ways to that manufactured in any other part of the province. Plasterers are always delighted when they get this lime. Not only has the product of these kilns had a great local sale, but it has found a market in all parts of eastern Canada and has found a ready sale in the United States. Probably Joseph Armstrong did

more than any other man to bring these kilns into prominence. He was at the head of the Green Head firm for about a half a century. The most prominent buildings in St. John have been cemented together with this famous lime, and so great was its reputation that the British government, when extending the accommodation for troops in Halifax in the year 1868, allowed no other lime than the Green Head to be used. The Nova Scotia provincial buildings and the Merchant's Bank of Halifax were built with Green Head lime. The Roman Catholic Cathedral in the city of St. John, which has stood the test of forty years, and been the pride of its parishioners during all of that time, was laid in Armstrong's lime. Perched upon one of the many beautiful and commanding sites at the mouth of the River St. John stands the lunatic asylum. The main structure was erected in the year 1853 by the famous contractors, Crosby & Small, a firm who used Green Head lime and no other. St. John's handsome passenger depot and substantial freight houses serenely rest where was erst while a filthy pond, whose disagreeable odor and wretched surroundings made York Point in the last generation a bye-word. It is needless to say that all the mortar used in these structures was made with Green Head lime. The government of a country always demands the best in any undertaking. With this end in view, when the dominion government erected the two handsome post offices (one which was destroyed by fire in 1877, and the other which stands today) at the corner of Prince William and Princess streets, the lime used in their construction was ordered at Green Head. In like manner, the most important structure of all, and by far the most expensive and magnificent of the federal buildings in the province, was built with Green Head lime. The present owners comprise the Armstrong Lime Co. Ltd. The officers of the company are Wm. Murdoch, president; Francis Armstrong, vice-president; Frederick W. Armstrong, managing director; Andrew D. Armstrong, secretary treasurer."

Gazette - Oct. 6, 1896 Lime Lost. - In the Market Slip this morning Charles Miller lime manufacturer, lost a quantity of lime. It appears one of his scows which had piled on it at the inshore end a quantity of barrel staves and on the other end somewhere about thirty casks of lime was grounded in the slip. The barrel staves were first removed and when the tide made this morning, the laden end of the scow failed to float and the rising tide flowed over the end of the scow and set fire to the lime. The accident is an unusual one."

Gazette - Jan. 26, 1897 Tariff Enquiry. - ....The lime burners next appeared. They were represented by Ald. Purdy and L. Rokes. The latter said there were in and about St. John 23 improved kilns, how many old ones he did not know. He gave figures of lime export for some years. From Canada as a whole in 1891, the export was $153,000 of this New Brunswick sent $101,894. In 1893 Canada sent $106,000 of which $61,000 was from New Brunswick. In 1896 New Brunswick sent but $18,362.45. In these cases New Brunswick really meant St. John said Mr. Purdy. The duty on lime was 40 percent ad valorem. Each kiln employed directly or indirectly about 41 men. Four kilns were enough to supply the local trade. This would leave 19 for export purposes. These would employ 780 men. To export to Boston and New York there would be employed 47 vessels, of 100 to 125 tone. The cost of the kilns was about $125,000. They felt reciprocity should be had if possible. A specific duty was not equitable. Mr. Purdy said if we came to the duty even in force before the McKinley bill we could export. We would be satisfied if we got back to the old duty. Reciprocity with the United States was needed for that was our market. Mr. Rokes said that two of the framers of the McKinley bill were in favor of lime coming free from Canada."

Codes: LIME / IDX_Names: Lime - General;
Daily Sun - Jan. 27, 1897 Tariff Enquiry. - ....The Lime Burners. - D.J. Purdy and L. Rokes were the spokesmen. Mr. Rokes said that what they wanted was reciprocity with the United States, so that they could export to that market, as was done before the McKinley tariff. In 1889 the lime exported from Canada was valued at $131,230.55; in 1890 at $141,708.91; in 1891 at $153,000, of which $101, 834 was from New Brunswick; in 1893 at $106,000, of which $61,000 was from New Brunswick. Practically the whole quantity from New Brunswick was from St. John. Last year the total value of the exports was only $18,362.45. The United States duty is about 40 per cent ad valorem, package included. Each kiln employs in burning, coopering, exporting, etc., about 41 men. There are in and around St. John 23 improved kilns. Four of these could supply the local market, leaving 19 to burn lime for export. These 19 would employ 780 men, and to export the product to Boston and New York would employ 47 vessels of 100 to 125 tons. The value of the kilns now existing is about $125,000. The owners want reciprocity, even if the Canadian duty on lime had to be removed. Sir Richard - What are the possibilities for extending the industry? Mr. Rokes - Unlimited. An old Knox county, Me. burner told me there was as much lime rock in the Drury's Cove property alone as had been manufactured altogether in Knox county. Mr. Rokes also pointed out that the Maine burners get three-fourths of their fuel from New Brunswick and Nova Scotia. This wood is free, but the Canadian lime must pay 40 per cent. A specific duty is not an equitable one on lime. For instance, lump lime brings 10 cents per bbl. more in New York than the common lime. Yet a barrel of it weighs only 200 to 212 lbs., compared with 250 lbs. in a barrel of common lime. Thus the lime of smallest value pays the largest specific duty. Mr. Purdy said that even if the United States duty were 10 per cent., as before the McKinley tariff, the St. John firms could export. Sir Richard - What are your special advantages here? Mr. Rokes - The natural advantages. Wages are not lower here. In Knox county three burners are paid $1.75 each per day, and a fourth for two hours work. Here there are four men at $1.30 full time. But there the quarries are back from the water, and deep. One is 250 feet deep. Here we are near the water and the stone is above the level. In 1895 there were 82,300 (?) cords of wood shipped to Knox county. This paid no stumpage and was sold cheap. We burn wood. They burn both coal and wood. Mr. Purdy - The lime business would be the heaviest business in St. John, not excluding lumber, if we had a free market. The kilns beside the water could ship for

export, and those inland supply the local trade. Mr. Rokes - Prior to the introduction of provincial wood, the cost of fuel in Knox county was $5.50 per cord. This year the average was not above $3.75. Mr. Purdy - Prior to the McKinley tariff, the burners here advised the Canadian government to reduce the duty from 20 to 10 per cent., and if that had been done I don't believe the American rate would have been advanced. We would be fairly well satisfied with a return to the old United States duty of 10 per cent. Mr. Rokes - If that cannot be done, or reciprocity secured, we would advise that an export duty be placed on kiln wood, which would make the Knox county lime cost 5 cents per barrel more. In reply to a question by Mr. Ellis, M.P., Mr. Rokes said lime was made in other states as well as Maine, but the provincial competition was not felt west of New York. The duty was to the interest of the Maine burners."

Gazette - Jul. 31, 1897 The Equity Court. - The case of Frye vs Frye which came on before His Honor Mr. Justice Barker in the Equity Court room at three o'clock yesterday afternoon was finished as the case was presented by affidavit. The court took the matter into consideration and will give judgment on Tuesday next. The facts of the case appear to be that Henry Frye, the owner of Frye's Island, so called in Charlotte is seeking an injunction against Charles Frye, his nephew, who for some time past has been managing the plaintiff's property, Mr. Henry Frye has been living with his daughter in this city for some time past and the nephew sets up a claim that he took control by request of his uncle. Henry Frye has executed a power of Attorney in favor of James A. Belyea of this city who demanded possession thereunder from the nephew who refused to surrender upon the ground that he had vested right in the property and also because of his doubts as to his uncle's capacity to make a power of attorney. The injunction is now sought to restrain Charles Frye from managing or in any way interfering with the property or its revenues which are said to net $4000 to $5000 annually. The counsel are J.A. Belyea and Allen O. Earle, Q.C., for plaintiff and M.N. Cockburn of St. Andrews and L.A. Currey, Q.C. for the defendant."

Daily Sun - Mar. 19, 1898 The Rate on Lime. - The Sun was called up by telephone yesterday afternoon from the I.C.R. divisional freight agent's office, and informed that the rate on lime to Halifax, as stated on Thursday by Mr. Harris, has been ten cents per 100 lbs. since March 1st, and that J. Willard Smith had called up the wrong office. The Sun called up Mr. Smith. That gentleman replied that he had called up the same office he always called up. He further added that he had himself been called up yesterday and was informed that the rate on lime had been fixed at ten cents. It would therefore appear that if the rate has been ten cents since March 1st, the fact has been concealed with great skill, not only from the public, but from some of those who ought to know."

St. Andrews Beacon - Oct. 5, 1899A Big Enterprise. - St. George Falls to beFurther Utilized. - Power Purchased for a Plant to Manufacture Carbide and Carbon. - Mr. John McCallum, at one time deputy crown surveyor of this province, and Mr. Henry McGrattan, of St. George, were in St. Andrews last week closing up the deal for the acquirement of certain water rights in the Magaguadavic Falls, St. George. The rights that they particularly sought, and for which a three months' option had been given, were those controlled by the Stevenson estate, and known as the Berry property. They include a large part of the shore on both sides of the river and falls. It is understood that"

Woodstock Dispatch - Oct. 17, 1899 Another drop in price of lime - C.M. Sherwood islanding a quantity of best Green Head lime, including the favorite brands of Marrow, and Purdy and Green. He will sell for $1.50 at Centreville."

S.J. Daily Sun - Apr. 18, 1900 A lot of lime is now being shipped from St. John to Sydney. It goes forward by rail."

Codes: LIME / IDX_Names: Lime - General;
Daily Sun - Apr. 19, 1901 Stetson, Cutler & Co. are shipping large quantities of lime to the United States. They recently received an order from a firm in Maine for twenty carloads of pulp lime, to be shipped at the rate of five carloads per week. Owing to the height of the water it has been found impossible to load the casks on slovens at the mill, so it is being sent to Indiantown on barges. Each barge carries ninety casks of lime, weighing four hundred and eighty pounds each. At Indiantown the limestone is loaded on slovens, hauled across to Fairville and dumped into boxcars, the teamsters bringing back with them the empty casks, which are taken to the mill on the barges. The loading and unloading of these casks causes Indiantown to present quite a busy appearance."

S.J. Daily Sun - Nov. 26, 1901 Hopewell Hill. - Capt. Albert Stiles, while quarrying limestone from a bank near the salt marsh lastweek, unearthed what is considered a fine specimen of fossil oyster. The fossil is about nine inches in length and is in two parts. The captain, says he expects to bring up a mastodon before he is through."

S.J. Star - Dec. 6, 1902 F. Stetson intends to build a large shed inconnection with his lime kilns, north end, about January 1st. It will be made so as to allow teams to drive in at one end, load, and go out at the other end."

Daily Sun - Mar. 4, 1902 Advance in Lime. - The St. John lime burners have formed a combination and advanced the retail price of lime in barrels to 75c. and casks to $1.20. The wholesale price for carloads or over, is 65c. for barrels and $1.10 for casks, compared with 55c. and 95c. last year."

St. Andrews Beacon - Mar. 24, 1904 It is reported that large deposits of the commodities entering into the manufacture of cement have been discovered to the eastern section of the county and that a syndicate recently incorporated will develop the business. Another industry added to Charlotte county would be very welcome."

St. Croix Courier - Feb. 28, 1907 and St. Andrews Beacon - Feb. 28, 1907 Develop Letang Cement Industry. - Mr. J. Sutton Clark says that one of the main objects in building a railway from L'Etang Harbor to a pint in York county is for the purpose of developing the immense cement areas at L'Etang, which are considered the best in America, and the industry will be most successful. Sydney now boasts he only cement industry in the Maritime Provinces. Cement will be used extensively to build the new railway from L'Etang. The cement output today in the United States is estimated at over three million barrels per year, and the outlook for the L'Etang cement is very bright, and L'Etang ere long may boast one of the greatest industries of eastern Canada. - Sun"

Evening Times and Star - May 26, 1910 New Company for Lime Business at Brookville. - Under the name of the Drury Cove Lime Co. Ltd., the following have applied for incorporation: L. Rokes, W.B. Tennant, Misses Z.A. and L.A. Rokes and Mrs. C.M. Tennant, off of Simonds (N.B.). The purpose of the company is to acquire and operate the business lately conducted by L. Rokes, and B.J. Morse at Brookville."

Campbellton Graphic - Jul. 14, 1911 Injured in Quarry. - John Black was severely injured in the Indiantown quarries on Saturday, being caught in the fall of a large stone and his right arm was badly crushed at the elbow and his leg also injured. Dr. McManus was summoned and the injured man was brought by train to Hotel Dieu. The injured arm can

Granite Town Greetings - Jun. 2, 1911Big Cement Company Seeking Incorporation. - Application has been made to Ottawa for incorporation of the New Brunswick Cement Company, Ltd. Capital $1,000,000. Head office, Hillsboro, Albert county, N.B. Capacity, 1,500 bbls. per day. These works, in addition to the large and increasing demand for high grade Portland Cement in the Maritime Provinces, where no cement works exist, will have the advantage of the requirements of the government works in Courtenay Bay. The duty on cement is 45 cents per bbl; freight from Europe added makes the cost from $1.65 to $1.85 per bbl. The freight from the upper provinces would prevent competition to any extent. The local position labor and material will go a long way to ensure success and the development of a new industry in Albert county will help the farmers and surrounding country irrespective profits to the company. - X"

S.J. Standard - Oct. 7, 1911 Will Have Industry on Green Head Site. - English Company May Establish Cement Plant There With Capacity of 2000 Barrels Per Day. - R. Max McCarty, who acting for an English company has been granted an option to purchase the Green Head property for $26,200, within ten months, stated last evening that he expected an English engineer would come out in a short time to examine the property. One engineer has already made an inspection of the property, and reported that it would make a first class site for a cement plant, as all the necessary materials are found on the lots in abundance. On the strength of this report the company put up $1,200 for an option on the property, but decided to have their own engineer examine the property and report before purchasing. Mr. Guernesy, who was here some time ago and made arrangements for securing an option, has been on a trip through the Canadian west and only recently returned to England. The company intend to put up a plant capable of turning out 2,000 barrels of cement a day. As an indication of the possibilities of this industry it may be mentioned that the Sydney Cement company which started in a small way has recently made arrangements to increase its output to 1,200 barrels a day."

Codes: LIME / IDX_Names: Lime - General;
S.J. Globe - Sep. 6, 1911 Important Discovery. - The New Brunswick Portland Cement Corporation, now working with steam drills to open up the limestone deposits in Albert County, have discovered another immense deposit of high grade rock on which they will at once put a further gang of men to develop. At present they have two gangs working. A telephone service has been arranged to the manager's house at the Albert mines and will be in operation by the end of the present week. This new industry is attracting much local interest, as it means the employment of a considerable amount of labor now, and in the future hundreds of miners and others. Things are being rushed in order to have cement ready for

S.J. Globe - Jul. 8, 1912 The Green Head Purchase. - On Saturday night the city commissioners ratified the transfer of the Green Head property to Mr. A.H. Hanington, the option price of $25,000 having been paid. It is understood a cement plant will be established there in a short time by the new company to be formed of parties closely identified with the Partington Pulp Mill Project. The property Mr. Hanington has secured comprises 224 acres and while the City Council order says it is to be used for the purposes of a cement industry it is said there is no binding time, so that the new owners can delay the establishment of such an industry for years if so inclined."

S.J. Globe - Jul. 25, 1912 Cement Company Is Seeking a Charter. - Messrs. N.M. Jones, Thomas McAvity, A.H. Hanington, Harry W. Schofield and Charles S. Hanington are seeking incorporation as the New Brunswick Lime & Cement Co., Ltd., with a capital of $500,000. This is the same syndicate as that which operates and manages the Partington pulp mills. It will take over the Green Head property recently purchased from the city and develop a lime and cement industry. The company is seeking authority to carry on such a business with head office in Lancaster, also the right to operate tramways, motors, barges, scows, boats, dredges, etc., to carry lumber and merchandise; to operate works for the sale of power, and generally to carry on a commercial business. The Green Head property, which the company has acquired, was sold under a general order of the City Council that it is to be used for the cement business, but this order of sale is not a particularly binding one and the company can probably take its own good time about getting to work."

S.J. Globe - May 2, 1912 The Cement Industry and The Merger. - Some Rumors of a Very Interesting Nature. - There are rumors that the Canada Cement Company, Ltd., does not look with favor on the proposed establishment here of a big cement industry, that will be independent of the merger. It is even intimated that an effort will be made to prevent the industry being established. A gentleman who is known to be an official of the Canadian concern, has been in the city for the last six weeks watching the course of events, and it is said has made some overtures to those behind the project that if accepted may result in the project being abandoned. A reason so many cement manufacturers are now turning their eyes to St. John is found in the great demand which the Courtenay Bay works will cause for the material. The importance of having a plant on the ground seems to be realized both by English and Canadian manufacturers. The property the city owns at Green Head and which Mr. Guernsey's company wants is supposed to revert to the city unless used in connection with a cement industry. Future developments will be watched with interest."
Kings County Record - Oct. 31, 1912 The government have purchased a plot of land at Havelock on which there is a large lime stone deposit that is to be used for conducting experiments in alfalfa growing. C.W. McDougal arrived home on the C.P.R. Wednesday from Sydney where he spent several days investigating machinery that is in use for grinding lime stone to be used for agricultural purposes."

S.J. Standard - Sep. 6, 1912 The Green Head Property. - The difficulty between the city and the Partington interests over the purchase of the Green Head property has been satisfactorily adjusted and it now only remains for the council on Monday to ratify the agreement that has been reached. It is understood the Partington interests will pay the city several thousand dollars more than was at first agreed on and will get full possession of the property without any restrictions as to its use. This means by paying the extra amount they will not be required to construct a cement industry, but can use the property for any purpose desired. The new deal is regarded as very satisfactory to the city in view of the circumstances."

S.J. Standard - Sep. 7, 1912 The Green Head Property Sale. - City Receives $12,500 Additional, But There Are No Restrictions. - Twelve thousand five hundred dollars is the additional sum that the Partington interests will pay for the Green Head property in view of the city waiving any restrictions as to the future use of the land. The purchase is a very important one. For the sum of $38,500 the pulp mill people have acquired a tract of land of more than 100 with valuable water front privileges and said to have great possibilities in connection with the lime industry. The old city council agreed to sell this property for $26,000 on condition that it be used for a cement industry. Unfortunately they neglected to put into the option they gave necessary restrictions. When the option expired the holder of it had sold out to the pulp mill people who paid the price and demanded their deed. Then the new rulers at City Hall sought to put in the conditions, and the buyers objected. The city had their money and they wanted their land, subject of course to the general provision in the agreement that it should be used for a cement industry, which in reality meant nothing at all. The pulp company was not unwilling for some conditions, but what it would accede to did not suit the commissioners and finally the compromise to accept $12,500 and sell the property outright was agreed on, so there is now no prospect of a cement industry unless the company find it to their advantage to establish one. They have secured a most valuable piece of city property, a a piece with a potential value almost unlimited and what for several years past has been regarded as the site for an industry of great importance. The new owners are a progressive corporation that has already done much and it may be that the future of the land will be better than if it had been sold with the restrictions that were contemplated."

Codes: LIME / IDX_Names: Lime - General;
St. Andrews Beacon - Oct. 2, 1913 New Industry at Letang. - The Pulverizing of Stone for Fertilizer Purposes. - A new industry is to be added to those at present in existence at Letang. This industry is to be installed at once by Mr. J. Sutton Clark, who has been very active in promoting the interests of Letang. It will be in the nature of a fertilizer plant, which will grind to a powder certain varieties of lime rock which exist in abundance at Letang. The product of this plant will be utilized by the Dominion Fertilizer Company of St. Stephen. The mill will grind about fifty tons of rock per day."

Kings County Record - Oct. 17, 1913 Benefits of New United States Tariff. - Gives anImpetus to New Brunswick Industries and Means much to Farmers and Other Producers - Of Very Great Benefit to Lime Industry. - That the United States tariff, which was signed by President Wilson last Friday will be of very great benefit to the manufacturers and farmers in the province is the declaration of all interested, many of whom have already begun to take advantage of the wider market offered. The people who will reap the greater benefits from the new arrangements will be the lime manufacturers, lumber dealers, produce merchants, and farmers, the duty on whose productions has been most noticeably lessened and in many cases entirely eliminated. The duty on lime entering the United States was formerly computed on the weight, but an ad valorem tax is now assessed. The old rate was five cents per hundred pounds, while under the new tariff it will be five per cent on the value. The weight of the package was formerly included in figuring the duty and with this eliminated and the rate taken only on the lime itself, the difference in the tax will be considerable. The opening of the extensive market should tend to increase the production of lime in New Brunswick, as the limestone deposits here are very large and the quality of the product is considered excellent. ...."

Kings County Record - Apr. 16, 1915 The lime pulver is working on the Foshay property at Fox Hill, and a large quantity of lime rock is being pulverized which will be used by farmers to sweeten the soil with. About two hundred tons will be ground. The machine is in charge of Mr. Rawson. It will go from here to Petitcodiac, where it will be put to work on the property of John Hughes."

Kings County Record - Mar. 19, 1915 Pulverized Limestone for Farmers. - Terms in which Provincial Governments Limestone Crusher May be Had - Charge Made Just Sufficient to Cover the Operation of the Machine. - The deficiency of lime in many of our New Brunswick soils is serious enough to constitute an important problem. Since pulverized limestone has been found just as effective as burnt lime, as well as a cheaper and more advantageous form to use, and limestone deposits are widely distributed over the province, the department of agriculture has purchased a first class portable pulverizing plant, which will be used to make demonstrations in the production of this material in as many localities as possible during 1915. A charge will be made just sufficient to cover the operation of the machine during the actual process of pulverizing. The machine has a stated capacity of tow or three tons per hour, depending upon the hardness of the stone and the size of the pieces. The feed opening will take pieces of rock five inches thick, eleven inches wide, and any length, but pieces larger than this must be broken before being fed. An elevator attachment makes it possible to bag the material or load directly into a wagon or a sled box. Terms and Conditions: 1. Any agricultural society or group of ten or more farmers may apply for a demonstration. 2. An application from an agricultural society must be signed by the president or secretary. 3. An application form a group of farmers must be signed by at least ten bona fide farmers who intend to use the material upon their own land, and who must appoint one of their number to make the necessary arrangements with the department of agriculture. 4. The amount of stone prepared for pulverizing must not be less than fifty tons, nor more than 200 tons, and in no case more than ten tons for any individual farmer of a society or group for which the demonstration is made. Applicants must agree to the following conditions: (a) To quarry the stone and have it ready before the machine arrives, pieces too large a size being previously broken. (b) To provide horses for the transportation of the pulverizing outfit to and from the nearest railway station, and assist the operator in loading and unloading at the station. (c) To provide the necessary labour to keep the operator supplied with stone and to remove the pulverized product; also to give the operator any incidental help required, such as transportation of gasoline or of water for the cooler on the engine. (d) To pay seventy-five cents per ton for the pulverizing of the material, and to make a settlement within thirty days of the completion of the work. (e) To refrain from selling any of the material, except by special arrangement, authorized by the department of agriculture. Note - Conditions (a) (b) and (c) are to be fulfilled free of cost to the department of agriculture. Applications: Write for application forms to the Soils and Crops Division,

Kings County Record - Nov. 11, 1921 ADVERTISEMENT: $3.00 Per Ton F.O.B. Brookville ----- Powdered Agricultural Limestone 96% Combined Carbonates ---- Order your supply now, while the hauling is good. The Fall is the best time to put lime on the ground. For information and to order apply to B.J. Sharp, Sussex, or write direct to Brookville Manufacturing Co. Ltd. Brookville, N.B. Operators Provincial Government lime plant."

Codes: LIME / IDX_Names: Lime - General;

Kings County Record - Apr. 27, 1928 Dolomite Development to Mean Manufacture of Magnesia Products in N.B. - Development of dolomite deposits on the lower reaches of the Saint John river which will result in the manufacture of magnesia products by a new corporation which will establish plants at or near the city of Saint John, is forecast in an announcement made from the Bureau of Provincial Information, Fredericton, N.B. Magnesian limestone which is present in large quantities near lime burning plants on the outskirts of the city of Saint John, has been found to contain as much as 42 per cent magnesia, making it evident that there is huge wastage in burning it in lime kilns. This situation having been investigated by H.G. Wildman, mineralogist of the Natural Resources Department, Canadian National Railways who has been actively cooperating with the Department of Lands and Mines, in the activities of the last few months, in connection with mineral development in New Brunswick, means have been suggested by this expert whereby through the introduction of modern methods the magnesia may be profitably separated from the lime and magnesium carbonate may also be recovered. Magnesia is in great demand in the world markets at the present time because of the new uses to which it is being put in connection with modern building construction operations. It is rapidly taking the place of asbestos in heating insulations and it is used extensively in the manufacture of fireproof flooring and wallboards in up to date building construction. Large quantities are also used in connection with the linen trade, Canada's imports for this purpose alone amounting to $300,000 annually, while in the manufacture of medicinal products further large quantities are required. There is therefore a large market in the Dominion for products manufactured from dolomite and it is understood that one of the largest mineral products marketing concerns in the world stand ready to take the entire product that is available. Plants which are now being worked out, for the development of the magnesian limestone or dolomite deposits call for the linking up of the interests owning the property and who are at present engaged in lime burning with other interests which have been engaged in gypsum manufacturing and the establishment of a plant which will be equipped with the most modern machinery and apparatus and will be located at or near the city of Saint John. The quarrying and separation plants at the scene of the dolomite deposits will employ at least fifty men, according to those interested in the project, and the number to be employed in the manufacturing process will depend upon the extent and variety of products being turned out.

Meanwhile New Brunswick is certain to reap rich benefits from the revelations which have followed discovery that magnesian limestone was being burned as ordinary limestone. The fact that New Brunswick has dolomite deposits has been known for some years, although little has been published regarding their existence. However, for some years the Fraser Companies have been operating a dolomite deposit and have now been using the product in connection with the manufacture of sulphite pulp at their plants in this province and the expansion of the pulp and paper industry now taking place in this province will thus afford a further home market for dolomite in New Brunswick."

St. Croix Courier - Nov. 29, 1929 Hydrated Lime Now Made In Maritimes. - Snowflake Lime, Limited, Erect First Hydrate Plant in Atlantic Provinces; Lump Lime Being Displaced. - Snowflake Lime Successors To Restigouche Company. - Snowflake Lime is not a new product, having been marketed continuously since 1885, but this is the first year that this well known lime has been available to the contractors of the Maritime Provinces in Hydrated form. About a year ago work was commenced on the installation of a Schulthess Hydrate Plant, the last word in hydrators, and the first to be erected in the Maritimes. Operation of the complete plant began in March this year and has continued day and night since then, turning out Snowflake Lime at the rate of two tons per hour in the various grades for use for industrial, constructional and agricultural purposes. There is no question but that hydrated lime will eventually replace lump lime entirely as it has elsewhere and as its many advantages become known. First of all it is free from grit and core, being air separated after a natural breakdown without preliminary crushing. It is uniform in quality, will not deteriorate and is very easy to handle, packed as it is in convenient 50 lb. multi- wall valve paper bags. But it is a saver of labor and time, is less expensive than lime in lump form, and very much cheaper than hydrated lime which up until this year had to be imported from Upper Canada. Snowflake Lime, Ltd., was organized in Dec. 1928, to take over, develop, and expand the lime business carried on for so many years by Stetson, Cutler & Co. Ltd. (later Restigouche Co. Ltd.) and commenced functioning on Jan. 1st this year. Archibald Fraser is president, Donald Fraser, vice president and C. Allan Beatteay, sec.-treas. and manager. Snowflake Lime in lump form is still manufactured, also Magnesia lime and out up in wood casks and barrels which are made in the plant cooper shop, so that all requirements for lime can be met and mixed cars supplied to the many dealers handling Snowflake products in various parts of the Maritime Provinces and also in Quebec and Maine."

Kings County Record - Jan. 3, 1930 Havelock. - The lime crushing business was the only one of importance to change hands during the year, being transferred from Mr. Downey to B. Keith. The usual number of orders were filled here also."

Codes: LIME / IDX_Names: Lime - General;

Kings County Record - Dec. 7, 1950 Blasting At Havelock Site Marks Preparation of Land For Plant's Main Building. - New Equipment Arrives to Speed Construction of Canada Cement Project. - Station Opened. - Officials and Employees of Company Guests of Residents at Welcome Party. - Work to prepare the site of the main building of the Canada Cement Company's manufacturing plant near Havelock is being carried out this week, with indications actual construction will be started within a short time, it was learned yesterday. Blasting is being done, and new, heavy equipment to prepare the land is arriving at Havelock. The heavy rains of the past two weeks have delayed progress to some extent. The dining room for employees, one of the first buildings erected on the company's 1,200 acre holdings, is expected to be in use for the first time this week. It is understood the Parsons Construction Company of Moncton has been awarded a contract for constructing a machine shop and the main office building. Property Changes. - Several properties along Havelock's Main Street have changed hands recently, it is reported, as the Kings County community prepares for the business expansion and housing demands expected to be associated with the new cement industry. Reports are current at Havelock a theatre is to be erected there. The C.N.R. station at Havelock, which has been handled by a caretaker, now is open at regular hours with a station agent in charge. No permanent appointment has been made yet, it was said. Havelock is connected with Petitcodiac by a branch line. Residents of Havelock held a welcoming party for officials and employees of the Canada Cement Company and its subsidiary, Maritime Cement Limited, and other newcomers to the area in the Memorial Hall last Thursday evening. Upwards of 150 persons attended."

Kings County Record - Nov. 16, 1950 Cement Company Begins Occupancy of New Buildings. - Men and Equipment Added to Working Force at Havelock Site. - Work on four buildings of the Canada Cement Company's new plant near Havelock is expected to be completed this week, it was learned yesterday, a few hours after a company representative had asked the Westmorland Municipal Council for tax concessions in the first official admission of the location of the industry. An office building, stores, dining-room-kitchen and living quarters, construction of which started only two weeks ago, either are finished now or will be ready within a day or so. Office furniture and equipment was being moved into the building yesterday. Temporary offices had been established in Havelock. The number of men employed on the project has been increased from about 50 two weeks ago to an estimated 150. It is not thought the number will be increased, at least until construction of the main plant is commenced. More Equipment. - New mechanical shovels have been brought in to prepare the ground for erecting the big building where, within a hear, production is expected to start with an output of approximately 800,000 barrels of cement a year. Levelling and filling are in progress. Construction of a railway spur from Havelock to the plant site, a distance of about one and one half miles, is progressing under contract to the Raynor Construction Company. M.A. Hoey, executive assistant to the general manager of Canada Cement, appeared before the Westmorland Council at Dorchester Tuesday and said the plant would be almost entirely within Westmorland County, at Butternut Ridge, with a small portion of land in Kings County. Fixed Tax. - The Council set the tax bill at $18,000 for the next 10 years, beginning when production starts. If production exceeds 800,000 barrels a year, the tax will be increased over the figure. Usual land and building taxes will be paid during 1951. Mr. Hoey said the plant would be beneficial to the province as a whole. He said factors entering into production costs included coal, of which about 30,000 tons is needed each year; comparatively small production with correspondingly high labor costs, and the New Brunswick provincial sales tax."

Kings County Record - Nov. 23, 1950 Couldn't Buy Lime For Farm, So Roy M. Alward Purchases Production Plant. - PHOTO. By J. Louis McKenna. - A young man who went to a small lime works at Springhill, near Havelock, 13 or 14 years ago to get some lime for his farm at Lower Ridge couldn't get what he wanted - so he bought the lime works. The young man was Roy M. Alward, and from that old, tractor-driven rock crusher has grown the Havelock Lime Works operated now at Havelock by Mr. Alward as the largest industry in the community at the northeast corner of Kings County. Mr. Alward, still the driving force which bought a plant when he could not get lime for his farm more than a decade ago, chuckles as he recalls how he became interested in the production of lime rather than the farming produce lime he helps to grow. 'When I couldn't get the agricultural lime I wanted, I asked the owner how much he would take for the plant. He told me, and I said 'Sold'. I started work there the next morning,' Mr. Alward explains. Small Start. - Three men were employed by him on the original site, and in the first year of operation they produced 186 tons of agricultural lime, 'and I had to go out and sell it,' Mr. Alward recounts. Today, Havelock Lime Works has a modern plant, four miles from the original site, designed by Mr. Alward to handle the lime from quarry to railway car and truck with a minimum of effort. The plant is being improved each year by the addition of new machinery. Instead of 186 tons, an annual output runs between 200 and 250 freight cars; and selling has become an easy matter. The three employees have grown to between 15 and 20. The present plant was built in 1945, opened in 1946. It sits partly atop a ridge of limestone, with a 14 car railway siding on one side and the quarry less than a quarter of a mile away on the other. What goes in one side as rough limestone, blasted by dynamite twice weekly from the quarry, goes out the other as agricultural limestone or crushed rock of various graded sizes, for distribution to all parts of New Brunswick. Larger facilities became necessary when Mr. Alward's selling powers, developed during the first year of business when customers were few, resulted in demand exceeding supply. The Springhill plant fell far behind in its orders. Much of the plant's output is distributed by trucks, which operate over a radius of 35 miles and deliver agricultural lime direct to the farm. The bulk, however, is shipped by railway; and that traffic has been a main source of revenue for the Petitcodiac-Havelock branch of the C.N.R. To meet the demands of his customers, Mr. Alward kept the plant operating 18 hours a day last summer. He acquired the mining rights to 360 acres of land when the Canada Cement Company, which had held them for years, relinquished the rights during the Second Great War. This year, Mr. Alward sold to Canada Cement the rights to 120 acres of the land. The new plant of Canada Cement is being erected about one mile east of the Havelock Lime Works. At the quarry, I saw a small crew of men operating a jack hammer, for which air is pumped 1,000 feet from an engine located near the main plant. The men were preparing the rock for dynamiting. Other men were breaking off loose bits of limestone, and a combined bulldozer and mechanical shovel was pushing broken rocks into piles and loading trucks for the journey to the rock crusher. Something Wrong. - We had just started an inspection of the plant, now operated by power supplied by the New Brunswick Electric Power Commission instead of the diesel engine in use earlier, when Mr. Alward excused himself and dashed to another direction. His trained ear had picked up a noise which shouldn't have been coming from one of the machines. He was back again in a couple of minutes, and the machine sounded, to me, more like a smooth-running machine should sound. a system of conveyor belts minimizes the amount of manual handling required to change the big pieces of rock into powder fine agricultural lime and graded limestone. After the once-big pieces leave the crusher, they pass through the screening machine, which deposits them in their proper bins. The oversize pieces continue to the pulverizer to become agricultural lime. Three Ways. - Disposition of the latter is made easy by a chute which can be turned to a bin, from where the lime is ed to a bagger, to the car waiting on the railway siding, or to a truck which can be backed into the plant. Latest piece of equipment to be added is a movable escalator which will speed up the handling of bagged agricultural lime which is to be stored. Expansion of his Havelock Lime Works, and the extra work entailed, is forcing Mr. Alward to spend less and less time on his hobby - horses. He has nearly 100 ribbons won at exhibitions and fairs throughout the Maritimes by his horses. Most famous in his Scout, which he has taught many tricks to entertain old and young. Another horse, a jumper, was sold recently after taking many top awards in horse shows. .... The Havelock Lime Works isn't much like its predecessor at Springhill, but it has been, and is, an important part of the economic life of northeastern Kings County; and there isn't too much change in the aggressive young man who bought a lime plant because he couldn't get lime, and

Codes: LIME / IDX_Names: Lime - General;
Kings County Record - May 10, 1951 Cement Plant's Construction Covers Quarter Mile Sector Along Butternut Ridge Road. - About 600 Men Employed in Push For Opening During August. - A sprawling octopus of stick and stone is spreading itself across the once quiet fields of Butternut Ridge - the old name by which postal authorities still recognize the nearby Kings County community of Havelock - just as fast as several contracting firms, machines and about 600 men can make it move. Great piles of sand and gravel lie atop the hill along the Butternut Ridge road, east of Havelock, ready to be converted into cement to fill the mile after mile of foundation for buildings which, by August, the Canada Cement Limited hopes will be the home of a great new cement manufacturing industry for New Brunswick. Production is expected to be about 800,000 barrels annually. Frameworks of many buildings, large and small, in hill and valley for a

quarter of a mile along both sides of the road, are changing in appearance daily as employees of Canada Cement, Canadian Comstock, Carter Construction Company and Parsons Construction Company rush construction to the limit supplies will allow. The shortages of materials resulting from Canada's war stockpiling have held back the progress of the construction, it is understood, by at least two months. Earlier in the development a production target of June had been established; but this has been discarded long since in favor of an August opening. Even then, reports say, the plant will not be finished completely. While most of the energy of the large crews is being expended just beyond the limits of Havelock, that community isn't being pushed completely into the background by what is happening beyond its borders. ... Watching over the development as permanent superintendent of the plant is H.W. Hamilton, an archery enthusiast whose compliance with company regulations makes it difficult, if not impossible, to obtain any information which carries with it an official blessing. One of the most colorful parts of the construction will be erection of the giant chimney which will carry smoke and fumes of the new plant far above the homes and farms of the surrounding countryside. A New York firm is said to have the contract for the smokestack, expected to reach 210 feet skyward. Already it pokes 50 or 60 feet into the air. Power for operating the plant will be tapped from the main lines of the New Brunswick Electric Power Commission as they pass at Canaan, nearly ten miles away. Poles to carry the power to the plant already have been placed. A railway spur from the C.N.R. line at Havelock is being made ready for use. The track has been laid, but extra fill is being put down to combat settling of the ground by the movement of frost after the winter. Because of this, equipment arriving almost daily is being unloaded at Havelock and trucked to the plant site. A huge furnace is at Havelock, held there until the rail line is strong enough to carry it."

Kings County Record - Mar. 6, 1952 Havelock Plant Now Operating Near Capacity. - The new plant of the Canada Cement Company at Havelock is operating at or near its full capacity of 800,000 barrels annually, J.M. Breen, president, reported at the company's recent annual meeting in Montreal. Until now, Mr. Breen said, the Maritimes have secured cement from the company's plants at Montreal East and Hull, Que., which now are expected to be able to fill demands from within Quebec province. construction of the plant at Havelock was begun about 16 months ago and was completed during the winter. It is the first cement plant to operate in the Maritime Provinces."
Kings County Record - Mar. 13, 1952 First Cement Moves From Havelock Plant. - First carload of cement to be shipped from the Canada Cement Company's new plant at Havelock was despatched Friday, according to word reaching Sussex from Havelock. The shipment was made by rail and originated along the spur line connecting the plant with Havelock. J.M. Breen, president of the company, announced recently the Havelock plant is operating at or near full capacity."
Kings County Record - Mar. 20, 1952 Welcome News From Havelock. - Two recent announcements concerning the Canada Cement Company's plant at Havelock should bring satisfaction to the people of Kings County, particularly those residing in and near the pretty community nestling along the Kings-Westmorland county line. The first announcement was made in Montreal by Mr. J.M. Breen, president of the Canada Cement company. It stated the plant at Havelock now is operating at or near full capacity. When the company requested fixed taxation about a year ago, it was indicated annual production would be about 800,000 barrels, and assessment was based on that figure. The second announcement was a news despatch from the Havelock correspondent of the Kings County Record. It was to the effect the first shipment of cement from the new factory has been made two weeks ago. Although the number of persons employed at the Havelock site will not touch the high levels obtaining when construction was at its peak, there is compensation in the fact those now working will be at their jobs steadily. The payroll will remain reasonably constant, to the benefit of those receiving their wages, the merchants and other business places of Havelock, and Kings County as a whole. Cement is a product which is liable to be in great demand for many years, whether we have peace or war. If peace lies in the future, there are numerous projects planned which will provide a ready market for cement. If war should come, there will be heavy demand for the product to be used for defence. No industry should be assured more of markets in the forseeable future. The people of Kings County will wish the Canada Cement Company well in its Havelock venture."

St. Croix Courier - Sep. 11, 1952 The Development of Our Natural Wealth. - The development of our natural wealth will do a great deal to broaden the economy of the Province and of the mining industry which for many years has been confined to coal and gypsum. Highlight of industrial development in the pastyear was construction of a cement plant by Maritime Cement Co. Ltd. subsidiary of Canada Cement Co. With an installed capacity of 600,000 barrels annually this plant fills a long felt need in the Maritime area. Expansion in the pulp and paper industry has continued and a new mill at Newcastle (Fraser companies Ltd.) has been brought into full production of sulphate pulp. Saint John Sulphate Co. has announced a $26 million expansion programme and work on it is now under way."

Codes: LIME / IDX_Names: Lime - General;
St. Croix Courier - Sep. 11, 1952 New Brunswick Forges Ahead. - New Base Metal Discoveries to Strengthen Forest, Farm, Fish Economy. - Rich resources in forest, farm, sea and mines - these are the basis on which the Liberal Government builds for the future of New Brunswick. New Brunswick can boast solid achievements and sturdy growths in the development of her primary industries. The long established industries - pulp and paper, lumbering, fishing, farming and others - have shown steady, healthy expansion in recent years and production is now at a much higher level than has ever before been experienced in peacetime history of the Province. New industries are coming to the Province. British industrialists are showing an interest in New Brunswick and among the new industries established is a large, modern printing and publishing business in Fredericton, involving a substantial investment of British capital. The new cement plant

at Havelock has provided much employment in that district. In the drive for new industry, provision of new sources of electric power is the major concern of the Liberal Government and special emphasis is now being placed on an intensive development of hydro resources on the St. John River and its tributaries. -- Lead, Zinc and Copper. - Great interest is being shown in the discovery of important base metal deposits near Bathurst in the northern part of the Province. Lead, zinc and copper of commercial grade have already been located and development work, initiated bylocal capital, has attracted some of the largest mining companies in Canada which are now actively engaged in further exploration. Minerals have long been known to exist in various parts of the Province. The Bathurst find has focused attention on the Province's over-all mineral possibilities and a large number of mining companies are now working in various areas. The outlook for development is very encouraging."

Kings County Record - Sep. 18, 1952 and North Shore Leader - Sep. 21, 1952 McNair Advertisement: New Brunswick Forges Ahead. - New Base Metal Discoveries To Strengthen Forest, Farm, Fish Economy. - ... The new cement plant at Havelock has provided much employment in that district. ..."

Kings County Record - Nov. 4, 1954 Big Cement Plant Boon To Havelock and Maritimes. - Since its establishment near Havelock more than two years ago the Maritimes' only cement manufacturing plant has been a boon to that Kings county village and cement users in the three provinces. Developments due to the sprawling $5,000,000 facilities of Canada Cement Co. Ltd., include increased employment, new houses, a bank branch, dial telephone system, renovations for a new post office and daily rail service instead of the former once-a-week train. Before the plant began production in March 1952 the Maritimes paid big freight bills for importing more than 1,000,000 barrels of cement a year from Quebec and the United States. The Havelock mill has a production rate of 800,000 barrels annually. Working a 24-hour day, it employs about 130 men on three shifts, seven days a week. It has been accident free from the start. Canada Cement operates seven plants in five provinces with an annual capacity of 17,500,000 barrels. From 25 to 30 freight carloads of cement roll daily from Havelock. The plant, one and a half miles east of the village is at a site containing a big deposit of limestone. Shale and gypsum, two other necessary raw materials are available a few miles away. ..."

Codes: LIME / IDX_Names: Lime - General;
Kings County Record - Apr. 11, 1963New Farm Produce and Marble Industries Seen For Kings County. - .... negotiations have been carried on for the last seven months with a large European firm interested in locating in Kings County to develop large- scale marble deposits in this county, with some Canadian capital also invested. .... As to the marble industry project, it was stated that a group of consultants and geologists has been investigating these deposits, and the related chemicals used, for the last 14 months, 'and investigations show a vast resource of chemical derivatives useful in the pulp and paper industries, rubber, cosmetics, fertilizer and building products.' At present, marble is being imported into Canada from Ireland, Belgium, Italy and Georgia, and marketing investigations by the consultants indicate a market across Canada, as well as in the United States, for marble building products, terrazzo tile chips and chemical components. Investigations also show; it was stated, a market for a steady supply of ground marble for the smelting operations in northern New Brunswick in the near future. Could Employ Thousands. - The employment potential in this industry would be several thousand men when operations are at full scale, and, as well, a large number of trucks operating full-time in moving the materials to market. It was stated that, as negotiations progress,drilling in the areas of Hampton, Norton, Upham, Southfield and Quispamsis will be done to 'prove up' the depth and determine the proper locations for opening quarries; and other locations, in relation to the quarries, for the removal of other materials for chemicals processing, according to the analysis of materials in each area. Deposits of silica clay are also being investigated, and reports on the quality of this material are expected to be available in the near future. The announcement noted that there is an interesting history concerning this area and the materials now being investigated - in the days before the First World War drilling was carried out in the lower part of Kings County in a search for suitable materials for cement manufacturing, but most of the records of the work have been lost. The reports of geologists show, however, that the marble is Precambrian, of fine grain, with large areas and blocks of pure white. In areas further east in Kings county, colors are varied; and near Rothesay the marble becomes slightly more coarse in grain and runs to pink in color. Marble is crystalized grains of calcite and dolomite, or a mixture of the two. Marble has the same chemical components as limestone and dolomite, the major difference being the components of particles of calcium or magnesium. Carbonates in limestone are granular and non-crystaline. Marble is regarded as a metamorphic rock resulting from recrystallization of limestone. At present most of the marble used in Canada is imported. Imports of building stone into Canada in 1959 were valued at $2,750,000, and in 1960 $2,850,000, of which marble accounted for about 44 per cent. Many Uses. - A survey of leading architects in Canada shows markets for marble for the following uses: Marble sawn and rubbed, marble building blocks, panels, fireplace hearths, pillars and planters, pre-fabricated shower units, wall tiles, marble sheathing, air raid shelters, furniture tops, and a large potential use in public buildings, when a source of material is available in Canada. There is said to be a vast market potential in Canada and the United States for marble, as terrazzo tile chips, largely imported from Italy at present (not included in the figures above). Several buildings in the Atlantic provinces already feature terrazzo chips from New Brunswick deposits. One major use for silica clay is in the manufacture of building materials similar to 'angel stone' in various colors. The material lends itself to retort baking. A large Atlantic Provinces manufacturer of bricks has expressed deep interest in this material, the announcement said; and it concluded with 'the development of these resources could be even larger in employment potential and sales than the mineral developments in northern New Brunswick.'"

Kings County Record - Nov. 23, 1967 3 pages of photos of Havelock Lime Works..."

Kings County Record - Dec. 31, 1968 Havelock Lime Works To Operate All Winter. - Havelock Lime Works, Ltd., an active and steadily expanding Havelock industry, will continue its operations throughout the winter, it has been announced by Roy M. Alward, the firm's president. In the past the plant had closed down for the winter season. Mr. Alward has now pointed out that some orders must be filled, and 20 to 25 men will be on the job through the winter months to complete the work. Officials of Maritime Cement Co. Ltd. have announced that the production facilities at the Havelock Canada Cement Co., Ltd., plant will shut down for the first time since operations began in 1953. The shutdown will come Jan. 1, continuing through the winter months. A company spokesman said that a large cement inventory and a lower volume of construction necessitated the temporary curtailment of production. During the shut down period, the packing and shipping departments will continue to operate and serve customers in the Maritime Provinces. In addition to unemployment insurance, the employees affected by the layoff will receive supplementary weekly benefits through a trust fund established for this purpose, the spokesman added. He said that approximately 70 to 75 workers will be affected by the winter shutdown."

Codes: LIME / IDX_Names: Lime - General;
Kings County Record - Mar. 26, 1970 $1,000,000 New Plant At Havelock. - Premier Louis J. Robichaud; Hon. H.H. Williamson, minister of economic growth, and Roy M. Alward, president of Havelock Processing Ltd., announced jointly today that a new $1,000,000 lime-processing plant will be constructed at Havelock. The project is the result of extensive development work by the company and the New Brunswick Development Corporation over the last two years. Construction will start on the site in April and the plant is expected to be in production by December of this year. Premier Robichaud said he warmly welcomed the new industry. 'The establishment of this industry,' the premier stated, 'is a clear indication of the effectiveness of government action to ensure the economic progress of all parts of New Brunswick.' The new plant will produce high quality calcined lime (quick lime) and hydrated lime for use by pulp and paper industries, pollution control agencies and miscellaneous construction purposes in the Atlantic Provinces area. PHOTO.- Caption. - Energetic founder and president of Havelock Lime Works, Ltd., is Roy M. Alward (above). He is president also of Havelock Processing Ltd. Completely Modern. - The plant will be modern in every respect, embodying the latest design and processing techniques, and will have a capacity of 120 tons per day of finished lime products. Storage facilities for 1,100 tons of finished lime will be installed, along with unloading equipment for placing the finished lime in rail cars or in pressurized road transport vehicles as required for delivery to the consumer. The minister of economic growth, Mr. Williamson, said 'this new viable industry should strengthen the economy of Kings County and create numerous jobs associated with the new plant.' Crushed limestone for the new plant will be supplied by Havelock Lime Works, Ltd., from its modern crushing plant which was installed in 1967. The plant currently provides crushed stone, fertilizer filler, agricultural lime and mineral supplement for livestock and poultry feed to consumers in the Atlantic region. The high calcium limestone will be quarried from the company's extensive reserves at Samphill, approximately four miles from the new processing plant. Roy M. Alward, who is also the founder and president of Havelock Lime Works, Ltd., said that 'in our negotiations over the last several months, the provincial government and the Development Corporation have been most co-operative and helpful in making this industrial undertaking possible.' Will Add To Employment. - The new project will create fulltime employment for an additional 20 people in the two companies as well as additional part-time work for residents of the area. The combined full-time staff by 1971 is expected to exceed 50. Arnold E. Alward is a vice-president of both companies and responsible for production. A.D.I., Ltd., Fredericton, are engineering and financial consultants for the project. SKETCH of Plant. - Caption - An Artist's sketch of the million-dollar lime-processing plant to be built at Havelock. Joint announcement of the large-scale project was made by Premier Robichaud. Economic Growth Minister Williamson and President Roy M. Alward of Havelock Processing Ltd. Construction is scheduled to start in April, and the plant is expected to be in production by December."

Kings County Record - Aug. 24, 1972 Havelock Plant Will Be Expanded. - The New Brunswick Development Corporation has made a $300,000 loan to Havelock Processing Ltd., for expansion of the company's facilities at Havelock. The Company produces crushed limestone for industrial and agricultural applications and as a raw material for hydrated lime. The expansion is under way and should provide 12 additional jobs by 1973-74. A new limestone processing plant is being installed to replace two of the old plants. It should be in production by Dec,. 1, 1972, according to company president Roy. M. Alward. Estimated cost of the modernization is $444,700. The new facility will allow the crushing of a broader range of marketable sizes. Havelock Processing is wholly owned by Havelock Lime Works, Ltd., which operates quarrying and crushing facilities and supplies crushed limestone, agricultural lime and poultry grit to Atlantic Province markets. The new plant, with its higher percentage of industrial markets, is expected to greatly stabilize the limestone processing operations and thereby provide steady employment for a large number of employees. Mr. Alward is president of both Havelock Processing and Havelock Lime Works. His son, Arnold E. Alward, is vice president and general manager."

Kings County Record - Nov. 30, 1972 To Expand Havelock Plant. - Canada Cement Lafarge Ltd., has announced a multi million dollar modernization of its Havelock plant. Built in 1951, this was the company's first modern plant using the dry process method of production. A second kiln was added in 1966 to meet the cement requirements of the Mactaquac power dam construction. Present plans entail the enlargement of cement and clinker storage facilities and the installation of increased grinding capacity. Considerable expenditures will also be made for dust collection equipment. The present capacity of the plant will be increased by 100,000 tons of cement per year to ensure sufficient production for the rising Maritime market. Construction will begin in the spring of 1973, it was stated."

Codes: LIME / A2 / IDX_Names: Lime - General; Albert / Kings County Oil Shales;
S.J. Standard - Aug. 14, 1911 To Work The Shale Deposits In Albert. - New Brunswick Portland Cement Corporation, Ltd., Will Be Organized Here in a Few Days. - A meeting of local capitalists will be held in a few days for the purpose of furthering the organization of the New Brunswick Portland Cement Corporation Limited. Application for incorporation has been made to the Federal Government, and it is intended to raise $1,000,000 to carry on the enterprise. Senator Domville is actively interested in the organization of the company. It is intended to utilize the oil shales at the Albert county mines for the purpose of manufacturing cement, and it is said that the company will be able to produce cement at a cost of 50 cents a barrel. The company will not need coal as the gas in the rock will provide the necessary fuel. Experiments have shown that a ton of shale will give 16,400 British thermal units, while a ton of coal only gives 13,400 units."

Codes: LIME / A2 / IDX_Names: Lime - General; Albert / Kings County Oil Shales;
S.J. Standard - Sep. 11, 1911 The Development in Albert County. - Senator Domville returned on Saturday from Albert county, where he has been inspecting the progress of the developments in connection with the project to establish a cement plant. 'Quite a force of men have been at work testingthe extent of the limestone deposits, and everything is going ahead in a satisfactory manner,' he said to the Standard. 'Near Demoiselle Creek they have discovered an immense are of limestone, and the analysis made from borings is entirely satisfactory. 'We have an inexhaustible supply of all the materials necessary for manufacturing cement, and we will go ahead with the development of our plant as soon as possible. Our plant will be erected on the main road between Hopewell and Albert Mines, and will give employment to a large number of men. 'We will be able to use the oil in the shale deposits for fuel and will manufacture the best kind of cement at a cost which will enable us to meet any possible competition.'"

Codes: LIME / E2 / IDX_Names: Lime - General; Oil and Gas - Kings Co.;
Kings County Record - Aug. 12, 1921 New Brunswick in Line For Big Development. - Kings County Will Get a Big Boost if Cement Works Are Established. - Understood That Options on Properties Will be Taken Up. - Outlook Good. - For some months representatives of the Canada Cement Company have been looking over the lime deposits of the parish of Havelock with a view to determining the quality of the rock at that place. Borings have been made in many directions and it is understood that the investigations have been most encouraging. The lime formations of Kings are very extensive and cover a very wide section. Several years ago, while boring for gas at Sussex, the drills were forced through limestone for over 1000 feet. This is the same reef which extends across the county from St. John to Westmorland. The quality of the limestone in the parish of Havelock, however, is said to be particularly good and it is this part of the great bed that the cement people have their eye on. In addition to extensive lime deposits, there also large bodies of oil shales in evidence. The drills located these to a depth of 150 feet in some places and had then not reached the limit. When it is stated that the promoters of the big Albert oil shale deposits have been assured that the refuse remaining after the oil is extracted provides one very necessary ingredient for the manufacture of cement, the presence of large bodies of shales near the limestone of Havelock, makes the proposition a most attractive one. Clay and marl are the two essentials for good cement, and Havelock is said to have them not only in quantity but in quality. For some time past the promoters of the big cement proposition have had options on a number of properties which they will require to give effect to their plans. Having satisfied themselves that the raw materials are available, it is understood that they are now taking up such land as they require and that the negotiations are now being closed, with every likelihood of a big cement proposition being put through sooner or later. A big cement plant at or near Havelock would give that section of the county a big boost. The cost of construction alone would run into millions of dollars and the wages paid out each year would reach high figures. One of the best plants in the chain run by the Canada Cement Company is at Hull, opposite the Dominion Parliament Buildings. There the company found an ideal condition, with an endless deposit of marl and across the C.P.R. tracks, which skirt the property, acres of the finest clay. At other cement plants it is found necessary to haul one or the other of the ingredients considerable distances by rail, thus adding to the cost of production. At Havelock, it is understood that this element in boosting the cost charges will be eliminated. Quite apart from the benefits which will follow to Havelock, should the big plant be located there, the Maritime Provinces should reap advantages as a whole. The big transportation charges on cement brought from Upper Canada would be cut off, and result in cheaper cement."

1764 In ""The River St. John"", by W.O. Raymond, 1950, Keystone Press, Saint John, p. 154-155. Simonds and White... Company ... The first year's experience was in some aspects phenomenal. On the 30th of September, 1764, a very severe shock of an earthquake occurred at St. John about 12 o'clock, noon... The business was then in an experimental stage, and Mr. Simonds in this letter writes: ""...If the lime answers well we shall want 150 hogsheads with hoops and boards for heads... We can work at burning lime, catching fish ... Next winter we can employ the oxen at sleding wood and Novascotian - Aug. 22, 1832 Windsor earthquake..."

Codes: LIME / F7 / GEOL / IDX_Names: Lime - General; Restigouche County Coal; Geology - General;

Royal Gazette - Nov. 12, 1842 To His Excellency Sir William MacBean George Colebrooke, K.H., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency, In compliance with Your Excellency's instructions, I haveproceeded to explore the Restigouche River, with some of its tributaries, and the surrounding country, a full account of which will be contained in the general report on the settlement lands. My son ascended the St. John to Madawaska, where he procured provisions, canoe and guides, to enable him to cross the waters of that River, to those of the Restigouche. Having ascended Grand River, and one of its branches to the distance of twenty miles, the canoe was carried across a portage of three miles, and launched in the Waagan, a tributary of the Restigouche, one hundred and thirty miles from its mouth. A Canal might be opened at a moderate expense in this quarter, to connect the waters of the St. John with those of the Bay Chaleur. I ascended the Restigouche and examined the country on each of its sides, and met the expedition from above a short distance below the mouth of the Upsalquitch. The difficulties of descending from the sources of the river at the present time of the year, are very considerable; as the season has been very dry we were compelled to drag our canoes nine miles along the bed of the upper part of the stream, and so great is the difference of climate in the wilderness, that ice was frozen half an inch in thickness in the upper part of the stream on the 12th of September, while at the mouth of the river no frost had been seen, and luxuriant crops of wheat were in full harvest. We were surprised to observe that the stream which has been generally understood to be the Restigouche, and is so called by the English inhibitants, is only a branch of the Main river. The Main River on some of the maps is called the Cadamkiewa, and Tom Kedgewick. The Indian name in the Micmac language is Pee-tam-kedge-wee. The southwesterly branch of the river above its junction with the larger stream is called by the Micmacs A-waan-jeet. The former stream is one third larger than the latter, and is eighty yards wide where it meets its chief tributary. It may be remarked here that where a river is forked, the Indians give a distinct name to each branch without reference to the name of the stream below. One of the sources of the main Restigouche or Pe-tam-kedge-wee, is near Tamisquata Lake, another approaches the Metis Lake very nearly. If the main Restigouche be the boundary between the Provinces, it will be seen by the reference to a good map, that a large tract of country will fall to New Brunswick, which has heretofore been considered to be on the Canada side; and it will also be seen that the outline of both Provinces will be very irregular and by no means convenient. On the Peninsula separating the River St. Lawrence from the Bay Chaleur, there is a lofty mountainous ridge - a branch of a chain called the Alleghenies, which extend through the United States. It was up to this ridge that the American Government laid their claim before the question of the Disputed Territory was settled, and until that period, the Restigouche formed a temporary boundary between Canada and New Brunswick; but since the happy terminations of that dispute, the range of Mountains separating the rivers that flow into the St. Lawrence, from those that flow into the Bay Chaleur, the Restigouche, and St. John, will in my opinion, form the best divisional line between the Provinces. Such a line would give to each Province all the rivers that flow and open into their respective districts, and would agree with the physical geography of the Country. The Restigouche forms an inconvenient boundary between the Provinces; all the timber cut upon the tributaries of that stream is shipped from Dalhousie and Campbellton on the New Brunswick side. The only land communication between the districts of Gaspe and Quebec, is along the Kempt or Metis Road, where a mail passes once a week. This road has never been opened and improved to any great extent. The Mail carrier rides about sixty miles on horseback, from the Restigouche to the Matapedia Lakes, where he feeds his horse on wild hay, and walks upwards of forty miles, to the mouth of the Metis River. This line of road runs through a very mountainous and broken tract of Country. The opening of a road from Fredericton to some part of the Restigouche is a matter of much importance to the Province. The lower part of the Restigouche is fit for cultivation, and southward of the Pee-tam-kedge-wee, or upper part of the Restigouche, the land becomes level. The soil on the Restigouche is of a good quality and produces excellent crops of all kinds of grain. The Restigouche is navigable for tow-boats andcanoes one hundred and twenty miles from its mouth. The Matapedia is then navigable fifty miles, and the Upsalquitch seventy miles. The district abounds inlimestone and marl, and there is a coal field near Campbellton. In bringing this communication to a close I beg to assure Your Excellency that I shall take the earliest opportunity to make up the general report of the Restigouche, which will include a full account of its minerals and other natural resources. I have the honor to be, Your Excellency's most obedient and very humble servant, A. Gesner, Provincial Geologist. Fredericton, 29th

Codes: LIME / G3 / IDX_Names: Lime - General; Granite;

St. Croix Courier - Apr. 30, 1874 and Eastport Sentinel - May 13, 1874 L' Etang Harbor.- ... Along the shores of the harbor are inexhaustible beds of Lime, portions of which will take a polish, and would make an excellent substitute for marble, and the Lime for other purposes is second to none. St. George, also the West Isles, adjoining, are rich in iron and copper. The red, or Scotch Granite formations - of world-wide reputation - are situated within six miles of L'Etang harbor and within three miles of the shipping port at the village of St. George. There are at present two companies operating in Granite, one an American and one a St. John Company, both of which have erected quite extensive polishing works, and are turning off work of a very satisfactory kind; but still, the present companies cannot supply the demand, and although the rock is being monopolized, still there is room, and inexhaustible quantities of it, which should be worked by capitalists; at least,

Codes: LIME / G3 / IDX_Names: Lime - General; Granite;
Daily Telegraph - May 1, 1891 Some Maine Industries. - The report of the Bureau of Industrial Statistics of the State of Maine furnishes food for thought to the people of New Brunswick. For instance there is the granite industry, which, in Maine employs 4,000 men directly, and gives employment to 500 more engaged in sailing vessels that are almost constantly employed in freighting the granite to different centers of trade. Those 4,500 men are the bread winners for nearly as many families, and it is safe to say that upwards of 20,000 people live by this one industry. What is also of consequence from our standpoint is that nearly all of the 44 granite operations employ more or less of Canadian labor. Some of them employ 10 or 12, and, as we learn from the report, which gives the nationality of the workmen in each concern, the Sullivan Quarry Company, out of a total of 155, has 27 Canadians in its employ. Why is it that in New Brunswick, with the best granite in the world, this industry is not a growing and a prosperous one! The province is close beside the state; we have equal advantages of water carriage, but our one large operator is removing his works across the border. The one only answer to the question is that Maine has the large market of the United States free to her granite while New Brunswick is shut up by tariff walls within such narrow limits that the business cannot be carried on at a profit. And so our strong young men cross the border in hundreds to quarry and dress the granite which Maine produces, leaving our own rich store of raw material undisturbed in its bed. What is true of granite is also in a largemeasure true of lime. No country in the world is better prepared in natural resources for a great lime industry than in New Brunswick. We have stores of limestone throughout the province and mountains of it lying alongside of navigable waters almost in the harbor of St. John. We have abundant fuel, and a large and profitable industry already developed, till the McKinley tariff destroyed the profits. While such is the condition on this side of the line, Knox county, Maine, employs 3,000 men in producing lime, and over 800 sea-faring men in its shipment. Some $200,000 a year is paid for kiln wood from the provinces, mainly from St. John river, which wood is carried directly past the immense and inexhaustible supplies of New Brunswick limestone. Knox county has the great free market of 60 millions from which St. John lime burners are almost shut out by a hostile tariff. There would be practically no limit to the expansion and development of the lime business in New Brunswick had we the market which reciprocity would give us."

S.J. Daily Sun - Mar. 21, 1893 S.J. exports. - By Sea per steamer New Brunswick, by C.E. Laechler ... 2 cs. granite .. Per steamer Heather Bell, for Boston, by Stetson, Cutler& Co. ... 1,272 bbls. lime ..."

St. Croix Courier - Oct. 30, 1952 Board of Trade at Waweig. - Granite Industry May be Revived at St. George. - Discussion ranging over a wide variety of topics formed the program at the fall meeting of the Charlotte Board of Trade, which has become a fixture of the harvest season at Waweig. In the absence of President H.W. Welch, Deer Island, Vice-President Boyd Merrill of St. Andrews presided... Granite Revival. - H.B. Robinson, St. Andrews, outlined plans to revive the granite industry in St. George if negotiations can be carried through successfully. An importer brought to Charlotte County to examine the black granite here pronounced it just as good as the Swedish product which commands a premium price, and is definitely interested in handling it. Mr. Robinson briefly sketched the history of this industry, which was founded by an artist who discovered the red granite and formed the New York & Bay of Fundy Red Granite Company, from which about six companies developed. None of the quarries ever went to any great depth, he said, and the history of granite is that the deeper you go the better it is. W.C. Hawker, St. George, quoted an experienced worker in granite as saying the St. George product is the finest he had ever handled. ..... May Be Developed. - Mr. Doyle expressed confidence that the deposits of red granite around St. George will be used and hinted at important developmentsbased on the large deposits of high-grade limestone at L'Etang."

St. Andrews Standard - Jan. 12, 1839 Geological Society. - The first annual meeting of the Geological and Mineralogical Society took place at their Hall, the President, Dr. Frye, ..?.. The following is the First Annual Report of thePresident and Committee of the Saint Andrews Geological and Mineralogical Society. Geology and Mineralogy as a study possesses ..?... [first 4 paragraphs unreadable] ...And it is due to Dr. Gesner ..?.. that the specimens presented by him were very fine, and that the interest and kindness ..?.. by him for the welfare and prosperity of the Institution entitle him to theconsideration of the Society. Here it may not be out of place to observe that the discovery of marble during his survey of this county is one of great importance to Agriculture and extremely interesting as a geological fact of a peculiar character indicative of a later formation than the new red sandstone and analagous to, but in some respect differing from the usual marl groups overlying similar formations the greater part of which has yielded to the approaches of the sea. Subsequently to the announcement of this valuable discovery, several members of this Institution have devoted much time and attention to it, and have been fortunate to meet with good beds of marl in various detached situations along the coast and had also made no inconsiderable progress in enquiring a knowledge of the general character the different formations in our neighborhood. This may be regarded as the first trust of our labour, and holds out simple encouragement for perseverance. It is thought, however, that a detail of these ..?.. investigations would be premature especially as an able report embracing a more extended and systematic view of the geology and mineralogy of the County may shortly be expected from Dr. Gesner employed by the Government in a scientific survey of a part of the Province, and from whose reputation and acquirements it cannot be doubted much information will be derived. The following Office Bearers were then chosen for the ensuing year:- S. Frye, President J. Rait } J. Wilson } vice presidents J. Rodger secretary G.D. Street Treasurer C.J. Briscoe } C.V. Foster } T. Sime } Committee J.H. Whitlock } H. Frye }"

Union Advocate - Mar. 17, 1870 Our Minerals and Fossils. - Possibly the accompanying list of Mineral and Fossil localities in the County, may be of service in directing the investigations of amateur Mineralogists and Geologists. It has been compiled from the Reports of Professors Bailey and Hind, and from notes of observations made in leisure hours, by myself, during the past summer.It is only proper to say that the Limestone on the Sevogle, and Hone Stone, at the Tomogonops, occur in vast beds. I have not been able, however, to find that any of the other minerals in the list are in such quantities as to make them of any value, although more thorough examination might show this to be the case. Copper Carbonate. - N.W. Miramichi, near 4 Mullin's, Sevogle. Copper Sulphuret. - N.W. Miramichi, near Mullin's and near Allison's. Gold. - Little S.W. Miramichi, Sand feebly auriferous. Near mouth of Sevogle.(?) Iron (as Red Paint).- N.W. Miramichi, near Mullin's and near mouth of Sevogle. Iron, Oxide. - Derby. Upper Nelson. N.W. Miramichi, near Peabody's. Iron, Arsenate. - Falls of Sevogle. Iron, Bog. - S.W. Miramichi, above Boiestown. Escuminac. Iron, Hematite. - N.W. Miramichi, near mouth of Portage River. Iron, Sulphuret. - Chatham, Newcastle, Boiestown, Sevogle. Manganese, Oxide (Wad). - Derby, Upper Nelson, N.W. Miramichi, near Peabody's. Trout Brook. Hone Stone. - Tomogonops. Limestone. - Sevogle. Gypsum (Selenite). - Sevogle. Gypsum, Fibrous. - N.W. Miramichi, near Portage River. Calcite. - Sevogle. N.W. Miramichi near Allison's. Coal. - Barnaby's River. Newcastle. Mill Cove, Chatham. Boiestown. Taxes River. FOSSILS Calamites. - Newcastle. Chatham. Barnaby's River. Concretions. - N.W. Miramichi, near Allison's and near Peabody's.Daoxylon Materiarum. - Miramichi, (Dawson). Equisetum. - Derby. Ferns. - Newcastle. Barnaby's River. Slate, finely marked with Mud Cracks and Rain Drops. - N.W. Miramichi, near Allison's. Wood, petrified and Wood, silicified. - Newcastle. Derby. Baie de Vin."

City Gazette - Sep. 1834Exports include plaster and limestone"

Cap. 98, repealed. Passed 10th April, 1875 Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly:- 1. The capital stock of the Sussex Lime and Plaster Company incorporated by the Act thirty seventh Victoria, Chapter 98, shall be twenty thousand dollars, instead of fifty thousand dollars, as provided by the said Act. 2. Section twelve of the said Act is hereby repealed. 3. Unless ten per cent of the capital stock of the said Company provided by this Act shall be bona fide subscribed within one year from the passing of this Act, the operation thereof shall cease, and the existence of the said Company shall terminate."

Royal Gazette - Jul. 1, 1874 CAP. XCVIII. An Act to incorporate the Sussex Lime and Plaster Company.Sec. Sec. 1. Company incorporated. 8. Principal office, 2. Capital stock. where established. 3. First meeting, where held 9. Transmission of and by whom called. interest in share, 4. Liability of shareholder to other than ordinary Company. transfer, how made. 5. Assessments upon shares, 10. Responsibility of how ordered. shareholder for acts 6. Shares not tranferable until of Company. all calls are paid. 11. Company may borrow 7. Annual meeting to be held. money; proviso. 12. Amount to be subscribed and paid in within one year. Passed 8th April, 1874 Whereas the Parish of Sussex, in the County of King's, offers advantageous situations for the quarrying and working of lime stone, and quarrying and manufacturing of plaster; and for procuring the requisite capital it is desirable to incorporate into a body politic and corporate such persons as may be willing to advance funds for such undertaking:- Be it enacted by the Lieutenant Governor, Legislative Council, and Assembly, as follows:- 1. William Pugsley, Junior, James Christie, M.D., John M. Smith, J. Herbert Crawford, M.P.P., Robert Pugsley, and James W. Nowlan, M.P.P., their associates, successors, and assigns, shall be and they are hereby erected into a body politic and corporate, by the name of ""The Sussex Lime and Plaster Company,"" and by that name shall have a common seal, sue and be sued, plead and be impleaded, answer and be answered unto, defend and be defended, in all Courts and places whatsoever, and shall have power, right and authority to purchase, hold and enjoy lands, tenements and heriditaments for them and their successors and assigns, and all other powers and privileges now incident to a Corporation by any Act of Assembly of this Province, for the purpose of quarrying, manufacturing and trading in plaster and limestone, conveying the same to market, opening and working quarries, and other business connected therewith; and also that they the said Company, or a majority of them, shall from time to time and at all times have full power and authority to constitute, ordain, make and establish such bye laws and ordinances as may be deemed necessary for the good rule and government of the said Corporation, provided that such bye laws and ordinances be not contradictory or repugnant to the laws and statutes of this Province, and those in force within the same. 2. The capital stock of the Company shall be fifty thousand dollars, with liberty to increase the capital stock to one hundred thousand dollars, to be divided into equal shares of twenty dollars each, to be paid in at such times and instalments as the business of the said Company shall require and every person who shall be a holder of one or more shares shall be entitled to vote, either in person or by proxy, having one vote for each share as aforesaid; provided however, that it shall be lawful for the said Company, or a majority of them, to establish by their bye laws as aforesaid, the number of shares which shall be necessary to entitle the holder thereof to more than one vote; and it shall be lawful for said Corporation to grant certification of paid up stock, in whole or part payment for the consideration of lands, quarries, buildings, machinery, mining rights and privileges in the place of money subscription to said stock, at such valuation as a majority of all the stockholders present or represented at any meeting shall fix. 3. The first meeting of the said Corporation shall be held at Sussex Vale, in King's County aforesaid, and shall be called by William Pugsley, Junior, or in case of his death, neglect, or refusal, by any two of the said Company, by sending a written or printed notice to each member of the said Company, at least ten days previous to such meeting, in order to organize the said Company, and for the purpose of establishing bye laws, choosing Directors and such other officers as may be necessary, which Directors and officers so chosen shall continue in office until the the first annual meeting, or until re-election, or others are chosen in their stead; and the members of the said Company, or shareholders present or appearing by proxy, shall organize said Company, establish bye laws, and choose Directors of the said Company, by a majority of votes. 4. Each and every shareholder in the said Corporation shall be and be held liable to the said Company for each and every call or assessment made, not however to exceed in amount the stock subscribed by him, for the purpose of enabling the said Company to pay the debts and engagements of the said Corporation, or for the purpose of carrying on the operations for which the said Company is incorporated; which call or assessment may be sued for by the said Corporation, and recovered in any Court of Record within the Province. 5. The Company or the Directors, if empowered by the bye laws of the Corporation, shall have power from time to time to levy and collect assessments upon the shares, or upon such of them on which the amount subscribed has not been paid up, of such sums of money as may be necessary for carrying on the business, or for the purpose or operations of the said Company; and whenever any assessment shall be made as aforesaid, it shall be the duty of the Treasurer of the said Company to send a written or printed notice thereof to each shareholder, requiring payment of the same within thirty days, and if any stockholder shall refuse or neglect to pay to the Secretary or Treasurer the amount of such assessment upon his share or shares at the time in such notice prescribed, the same may either be sued for and recovered in the prescribed in the last preceeding Section, or the Secretary or Treasurer may advertise all such delinquent shares for sale at public auction, giving at least thirty days' notice in writing to such shareholder, of the time and place of such sale; and all shares on which the assessment or any part thereof is not then paid, with interest from the time such assessment became due, may be sold to the highest bidder; and after retaining the amount of such assessment, and all interest due thereon, and all expense of advertising and selling, the residue (if any) of the moneys paid over to the former owner or owners thereof, and a new certificate or certificates of the shares so sold shall be made out and delivered to the purchaser or purchasers thereof. 6. No shareholder shall be

entitled to transfer or vote upon any share after any call shall have been made in respect thereof, until he or she shall have paid all calls for the time being due on every share held by him or them. 7. An annual meeting of the shareholders of the Company shall be held for the transaction of general business and the election of Directors; the time and place of meeting and the number of Directors to be regulated by bye law. 8. The principal office of the Company shall be in Sussex, in the County of King's, but the Company may establish agencies or branch offices in any part of New Brunswick. 9. The transmission of the interest in any shares of the capital stock in consequence of the marriage, death, bankruptcy or insolvency of a shareholder, or by any other lawful means than an ordinary transfer, shall be authenticated and made in such form, by such proof, with such formalities, and generally in such other manner as the Directors shall from time to time require, or by any bye law may direct. 10. The shareholders of the Company shall not as such be held responsible for any act, default or liability whatsoever of the Company, or for any engagement, claim, payment, loss, injury, transaction, matter or thing whatsoever relating to or connected with the Company, beyond the amount of their respective shares in the capital stock thereof. 11. The Directors may from time to time, with the consent of a majority of the shareholders present or represented in a special meeting called for that purpose, borrow money on behalf of the Company; and the Directors may, for that purpose, make or cause to be made bonds, or other instruments, under the common seal of the Company, for sums of not less than one hundred dollars each, which shall be a lien and charge on the stock and property of the said Company; provided that the aggregate of the sum or sums so borrowed shall not at any one time exceed one half of the amount of the paid up capital of the Company for the time being; and no lender shall be bound to enquire into the occasion of any such loan, or into the validity of any resolution authorizing the same, or the

Royal Gazette - Apr. 8, 1840 Cap. XLIV. An Act to Incorporate the Saint George Lime Company.9 Passed 25th March, 1840. Whereas a Joint Stock Company or association hath lately been formed within this Province, which has invested considerable sums of money in the purchase of a valuable tract of Land abounding with Lime Stone at L'Etang, in the County of Charlotte, and made extensive Lime for home consumption and exportation; and whereas it hath been deemed expedient to afford protection and encouragement to the said Association by an Act of Incorporation; 1. Be it therefore enacted by the Lieutenant Governor, Legislative Council and Assembly. That William Savage, Zebedee Cook, Junior, Thomas Dexter, Joshua C. Bates, Joseph Willard, Thomas Darling, Joshua Tucker, Elijah Thayer, David A. Simmons, Josiah Reid, Thomas J. Whittimore, Jonas L. Sibley and De Vere Burr, their associates, successors and assigns, shall be and they are hereby erected into a Company for the purpose mentioned in the Preamble of this Act, and declared to ba a body Politic and Corporate by the name of The Saint George Lime Company, and by that name shall have all the great powers and privileges made incident to a Corporation by Act of Assembly of this Province. II. And be it enacted, That the first meeting of the said Corporation, shall be called by De Vere Burr, or in the case of his death, neglect or refusal, by any two of the said Company, by giving fourteen days notice previous to such meeting, which shall be holden at the time and place specified in such notice. III. And be it enacted, That the Capital Stock of the said Corporation shall consist of the sum of twenty five thousand pounds, to be paid in such money as shall at the time of the several payments herein after expressed be a legal tender in this Province, fifteen per cent. of the said Capital Stock to be paid in before the said Corporation shall be entitled to purchase any property real or personal, or incur any debts, and the remainder of the said Stock to be paid at such time and times, and in such parts or portions as the Directors for the time being shall from time to time think necessary, the whole amount of such Capital Stock to be divided into one thousand Shares of twenty five pounds each. IV. And be it enacted, That unless fifteen per cent. of the said Capital Stock shall be actually paid in for the purposes of the said Corporation, and a certificate of such payment made and verified on oath by the Directors of the said Corporation, or a majority of them (which oath any Jusice is hereby authorized to administer), shall be filed in the office of the Secretary of the Province before the expiration of three years after the passing of this Act the operation of this Act shall cease, and the existence of the said Corporation be terminated at the expiration of the said three years."

Royal Gazette - Apr. 18, 1888 Public Notice. Notice of intention to apply for incorporation by Letters Patent under and in terms of the provisions of the New Brunswick Joint Stock Companies' Letters Patent Act, of the Portland Lime Company. 1. The proposed corporate name of the Company is the Portland Lime Company. 2. The object of said Company is the manufacture and sale of Lime, Marble, Lime and other Stone, and the leasing and owning of real estate, vessels or other property in connection with said business. 3. The place of business is the City of Portland, New Brunswick. 4. The amount of Capital Stock of the Company actually subscribed is thirty thousand dollars. 5. The number of shares is three hundred, and one hundred dollars is the amount of each share. 6. The following are the names, addresses and calling of the applicants, the first three named of whom are to be the first or Provisional Directors of the Company:- Darius B. Warner, of the City of Saint John, Mill owner. Ezekiel B. Ketcham, of the City of Portland, Manufacturer. James R. Warner, of the City of Saint John, Mill owner. J. Henry Leonard, of the City of Saint John, Accountant. William C. Purves, of the City of Portland, Manufacturer. James Straton, Solicitor for Promoters."

Royal Gazette - Nov. 12, 1842 We draw attention to the extracts from two Reports of Doctor Gesner on the Tobique and RestigoucheRivers, which he was deputed to explore, with a view to ascertain the capabilities of lands for settlement. To His Excellency Sir William MacBean George Colebrooke, K.H., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency, I beg leave to lay before Your Excellency a brief report on the explorations of the Tobique River. A more particular account of which will be contained in the report on the settlement lands. The Tobique River is the largest tributary of the St. John, excepting the Restcook, to which it is very nearly equal. Its mouth is twenty miles below the Grand Falls, and two miles below the confluence of the Restook with the main stream. The main Tobique extends to the northeast, and about a hundred miles from its mouth by the courses of the River, it is divided or forked into four branches. One of these branches enters from the southeast, and is supplied with water by three lakes, the largest of which is twelve miles in length. These lakes are situated at the chief sources of the main northwest Miramichi. The Indian portage between the St. John and Miramichi waters is only one mile in length. The other branches of the Tobique extend northward and meet the heads of the Nepisiguit and Upsalquitch, whose waters descend in an opposite direction to the Bay Chaleur. The Tobique, Miramichi, Nepisiguit and Upsalquitch Rivers, all take their rise in one district, and at the bases of the highest mountains in New Brunswick. Extending across the State of Maine in a northeasterly direction, there is a chain of high lands, occasionally elevated into mountains of considerable altitude. This branch is a part of the Allegheny chain, and embraces Cataadan and other mountains in the State of Maine. After entering New Brunswick, this branch sends up Mars Hill, Moose Mountain, and Bear Mountain, on the St. John, between Woodstock and the Grand Falls. The same range extends in a northeast direction to the heads of the before mentioned rivers, where some of the mountains exceed two thousand feet in height. This mountainous district gradually subsides as it approaches the Bay Chaleur, and the north coast of the Province is remarkably level. Another alpine ridge extends through the middle of the District of Gaspe, and separates the waters that flow into the St. Lawrence from those that fall into the Bay of Chaleur, and River St. John. The Tobique, Nepisiguit, and Upsalquitch, all take their rise in the broken and mountainous termination of the New Brunswick range; and after descending from fall to fall, they sweep through the vallies and receive the tributaries of the lower grounds, until they are lost in the larger streams into which they open. As the Tobique River and its tributaries are uninhabited, a sufficient stock of provisions was procured, and three Indians, with as many light bark canoes were hired for the expedition. Accompanied by my son, and Mr. James Millidge, the ascent of the river was commenced. We started from Fredericton on the 27th of June, and reached the mouth of the Tobique with the canoes, instruments and baggage, on the 3d of July. At the entrance to the river there is a considerable tract of intervale, which with several thousand acres of excellent upland belongs to the Melicete Indians. There is here an Indian village containing two hundred souls, and as this place is a depot for Timber, upwards of three hundred men were employed in preparing rafts of Timber to descend the main stream. As these Indians scarcely cultivate their lands, and their grant occupies a most important situation, it would be advantageous if some exchange could be made, whereby they would possess equal if not greater privileges. I am confident that if these valuable lands could be obtained by other inhabitants of the country, they would be immediately settled, and a flourishing town would soon be built upon the grounds now unprofitably occupied by the Aborigines. During the rafting of the Timber, many of the Indians are employed; but their chief occupation is hunting and fishing. We observed among them a quantity of Fur, taken from Ambrose Bear and his brother, valued at œ150, among it were eighty Beaver skins, and about thirty pounds of Castor. About a mile above the Indian Village there is a dangerous rapid called the Narrows. At this place the River to the distance of a mile passes through a gorge only one hundred and fifty feet wide, and between cliffs from fifty to one hundred and fifty in height. It is evident that at some former period there has been a great fall at this place, and their evidences that the barrier to the water has been broken, and the River above gradually lowered. The water rushes through the gorge with great violence, and the projecting masses of rock produce dangerous rapids. During the freshets of Spring and Autumn, this channel is too narrow to give vent to the river; and the water from being thus partially dammed up, overflows the shores above to the distance of two miles. At such periods boats and canoes cannot pass; and such was the violence of the rapids in July, that we were compelled to draw our canoes up with tow-lines. The navigation of the River at this place, might be rendered safe and easy, by the erection of dams and locks; there is here an excellent site for Mills which might be set up, without much injury to the salmon fishery. From the mouth of the river to the Red Rapids, a distance of twelve miles, there is some good intervale, the lands are high and the soil productive. Several squatters have settled on the banks of the stream. The Tobique Mill Company built a dam across the river, and erected extensive saw mills in 1837, but before these mills were put in operation, a part of the dam was carried away. The Mills have since been taken down with the intention of moving them to the Narrows below. œ27,000 were expended by the company at this place. Three millions of logs that had been cut, have also been lost in the speculation. The establishment is now a deserted village. If a dam should be built across this stream, a free passage for salmon and other kinds of fish should be secured, as there is scarcely a better river fishery in the Province. Our third encampment was at Plaster Island about twenty five miles from the St. John, and two miles above the mouth of the stream called by the lumbermen Wapske or Wapskehegan. Between the island and the Red Rapids, the Otelloch, Otella, three brooks, and other smaller rivulets enter the Tobique. The main River here is extremely beautiful, being decorated by numerous small islands and belts of intervale, covered with elms, balsamic poplars, and other trees characteristic of a most fertile soil. The Wapskehegan is a large stream coming in from the eastward. At its sources it approaches very nearly a branch of the Miramichi, and it runs through a fine tract of intervale and excellent upland. A mile below the Red Rapids, the calcareous shales of the St. John are overlaid by a bright red sandstone, a rock that always indicates a good soil. This sandstone occupies a large tract in this quarter, and extends up the River to the base of Blue Mountain, twenty miles farther northward. At Plaster Island, on the banks of theWapskehegan, and so far as we could discover in a district of several thousand acres, there is an abundance of excellent gypsum. At the Island on the left bank of the Tobique, the gypsum occurs interstratified with the red sandstone in a cliff 135 feet high. It is of the fibrous and compact varieties, and some of the strata are of a bright red color. This gypsum may be transported from the Wapskehegan down a branch of the southwest Miramichi, and supply the country in that quarter, as well as the valley of the St. John, with excellent mineral manure. A short distance above the head of the island,there is a small brook of brackish water, it proceedsfrom a salt spring, a mile and a half from the river. There are also other indications of rock salt in this quarter.About a mile farther up the stream I discovered an immense ridge of limestone, at the side of the River. This limestone is stalactital like that found in the interior of caves. Apparently the river at this place, has broken into a cave of considerable magnitude, and stalactites are scattered along the shore. From the deep fissures and chasms concealed beneath the fallen trees and other vegetable rubbish, it is dangerous to walk over this rock; there are many good reasons for believing that the earth is cavernous at this place. Above Plaster Island the river becomes very serpentine, and where the intervale is absent, the banks on each side are from fifty to a hundred feet high. About twelve miles above the mouth of the Wapskehegan, another large stream called the Agulquac, enters from the eastward; this stream also passes through a fine tract of country. A large area here was overrun with fire a few years ago. It is probable that this was the same conflagration that destroyed the towns and villages of Miramichi, in October, 1825, but as there are no inhabitants in this quarter, the exact period of its occurrence has not been ascertained. From the mouth of the Agulquac to the base of Blue Mountain, is about eleven miles, the River here is eighty yards wide, and is skirted with fine tracts of intervale. There are also numerous alluvial islands covered with lofty and thick foliage. At the foot of the Mountain the red sandstone reposes on the transition slates. The whole country from this mountain is comparatively level; but from this point northward, it assumes new features and becomes more elevated. About eighty miles from the mouth of the Tobique, the river divides into four branches. The Little Tobique, Mamozekee, and Right Hand Branch, extend to the source of the Nepisiguit, and wind their way among naked and almost inaccessible mountains of granite and trap rock. Bald Mountain is 2,240 feet high, and is surrounded by several lofty peaks, but little inferior in altitude. It was my intention to have visited all these mountains, but the streams had become too dry for our canoes, one of our Indians had deserted, and the two that remained, refused to proceed any further into the wilderness. Our provisions were reduced almost to the choice of fish caught in the stream, and our faces and limbs were swollen and painful from the innocent stings of the insects in the forest. The whole surface of the country in the direction of the Tobique River, from its mouth to the distance of eighty miles northward, is capable of the highest degree of cultivation. The soil in general is equal to, and often surpasses the best kinds I have seen in the Provinces. I had supposed, from the accounts received from persons who had been engaged in procuring timber up the stream, that there were many places where the soil was unfit for cultivation; but such an opinion has arisen from the dreary appearance of the surface, where it has been overrun with fires. In every quarter we found a deep, rich, and strong soil. Formerly there were immense groves of white and red pine in the vicinity of this stream, but most of these have been removed or destroyed by fires. At present there is comparatively but a small quantity of pine, spruce, cedar and sometimes beech, birch and maple. Along the whole course of the stream, there are tracts of the best quality of intervale, covered with elm and balsamic poplar, ash, alder, &c. Wild hay is abundant. Besides these, we found indigenous grape, wild plums, currents, gooseberries, mint, rhubarb, and onions, with all those plants which only flourish on the richest soils. In descending the river, I counted seventy islands, all composed of alluviums. The limestone, gypsum, and salt, are very valuable in this part of the Province, and they are so situated that they may be transported over a wide extent of Country at a trifling expense. The river abounds in salmon during the season, and there is always an abundant supply of trout and whitefish in its waters. John Cahile, who lives near the mouth of the river, killed twelve barrels of salmon with a single spear last season; they were sold for œ5 per barrel. The river is navigable for canoes and tow-boats about one hundred miles from its mouth. There is only a portage of two miles between its head waters, and the Nepisiguit, and one of three miles to the Upsalquitch. The lands upon the Tobique remain ungranted. Under a due consideration of all the advantages offered by the river and for the soil of the intervales and uplands, I am fully of the opinion that this tract of country, which embraces several millions of acres, is better adapted to the circumstances of respectable Emigrants and other settlers, than any other district I have seen in New Brunswick or Nova Scotia. Much confusion has arisen in the names of places within the Province from the careless manner in which these names have been written and spoken. A great number of rivers and lakes still retain in some degree, the ancient names of the Melicete and Micmac Indians; but those names in many instances have been changed or corrupted ao that they are not now understood by the Aborigine themselves; and they are seldom written in the same manner by the inhabitants of the Province. Other names are those of the early French settlers; these also have become imperfect, and even English names are sometimes written improperly on Maps or other public documents. I have taken the liberty to insert the names of places on the Tobique, as used by the inhabitants, and opposite to them the Indian names. Tobique Naa-cootke, Otelloch Hotelle, Otella Na-me-taaps-k-waac-sis, Mamozekel Epe-ce-tus-sis, Right Hand Branch Qua-quaps, Serpentine River Wa-ca-souis, Lake Quispaam, Trowsers Lake Nee-taa-waac-paac, Sisson Branch Wa-caa-so-nee, Little Tobique Caac-seo-sic-ka-wa-ic, Bald Mountain Es-coot-naak-a-witz, Three Brooks Naa-saa-taa-gan. The present brief report has been drawn from extensive notes taken during my exploration of the Tobique, and I sincerely

Codes: LIME / P3 / Z2 / IDX_Names: Lime - General; Albert Lime, Phosphate and Brick Company; Sandstone, Building Stone, Monument Stone, etc.;

Daily Telegraph - Mar. 9, 1878 Limestone Deposit in Albert. - A correspondent of the Times says it is reported that a company is organized to manufacture lime on a large scale at Demoiselle Creek. This company have secured a limestone deposit from Beatty Steeves and James Nelson, and is now engaged in the necessary preparations, such as hauling free stone for building kilns, wood for fuel, etc. Lime made from this stone is said to be better and stronger than the Greenhead or any other lime made in the province. The rock is very easily quarried. If this deposit turns out to be as good as it is thought now to be, and considering that it is only a few hundred yards from the Albert Railway, it is no doubt very valuable. If half or even one quarter of the lime is manufactured that is talked of, say 40,000 bbls. per year, an extensive business will be done which must greatly benefit everybody in the locality. It is to be hoped that the most sanguine hopes of the promoters of the enterprise will be realized."

Codes: LIME / P7 / IDX_Names: Lime - General; Lepreau/ Pocologan Silver;

St. Croix Courier - Jul. 10, 1890 Pennfield.- Some excitement has been caused on the Ridge by the discovery of a silver deposit on the farms of Samuel McKay and George H. Tatton. Specimens of the ore have been sent to New York and pronounced good.There is also a rumor of a rich marble deposit, the secret of which is held by Mr. B. Young."

Codes: LIME / X1 / IDX_Names: Lime - General; Grand Lake Coal;

S.J. Daily Sun - Dec. 14, 1894 Grand Lake Coal. - (Fredericton Gleaner). - From twenty to thirty tons of Nova Scotia coal for the chemical pulp works at Chatham are daily passing over theCanada Eastern. Twenty dollars per day paid to the miners at Newcastle may seem a small item, but a great deal larger amount would be paid to them if the railroad from Fredericton to the Newcastle coal fields via the Canada Eastern were constructed. The latter road would use from six thousand to eight thousand tons per year, while the C.P.R. would be a good customer for steam and forge coal. Cheap coal at Fredericton, so conveniently situated as it is with respect to the other portions of the province, would mean greatly increased prosperity for this city. With better facilities for manufacture of chemical pulp than Chatham, we have the same railway which supplies the Chatham pulp manufactory to supply us with the best of pulp wood; in addition, the Canadian Pacific can bring vast quantities of wood from Keswick and other places. While Chatham has to bring its lime very often by rail, we can get it directly from St. John as a return freight for Mr. Gibson's barges. Probably no better place could be found in the dominion for the erection of the chemical pulp works than on the banks of the St. John river at Fredericton, provided only that there was connection between that place by rail with the very extensive coal fields of Newcastle. When this is done we predict a period of unexampled prosperity to Fredericton and the surrounding country. We had almost forgotten to mention that pulp mills at Fredericton would not only use up all the slabs and other waste wood resulting from the mills here, but every little mill up the St. John river could float its refuse wood to such an establishment. With the introduction of cheap fuel, many other branches of industry would spring up, such as the manufacture of tiles for drainage pipes, fertilizer works, and many other industries in which fuel is a matter of prime necessity. Just now it would be well for the city council to give this matter its attention. Let this road be commenced from the line of the Canada Eastern, instead of from Newcastle."

Carleton Sentinel - Jun. 4, 1850 Report on the Agriculture Capabilities of New Brunswick (#4) by J.F.W. Johnston, F.R.S., &c. In the Geological Map, No. 1, attached to the Report, it will be seen that, a large breadth of the province rests on what are called the Coal Measures.These strata or beds of rock are of the same general age as those in which the productive coal beds of Nova Scotia, of Prince Edward Island, of England, and of the United States occur, and they contain in various places the seams of coal which are to be seen in many parts of the Province. Attempts have been made, from time to time to work these beds, especially on the Grand Lake, the Memramcook, the Petitcodiac, the Salmon River, the Coal Creek, of the Saint Nicholas River, and in other localities; all these attempts however, owing in part to the thinness of the seams, to the impurity of the coal, and to their occasional high inclination, have failed to raise the mineral in any considerable quantity, or to yield a reasonable profit to the undertakers. The existence of available beds of coal in the Province, has hitherto been looked upon more in an exclusively manufacturing and mercantile, than in an agricultural light. Iron ore is said to be abundant, and if coal could be found to smelt it, centres of industry would spring up which would enhance the price of agricultural produce in their neighborhood. This is true, but the actual existence of the coal would render unnecessary the large growth of wood for fuel, and would thus set free a great extent of land for the exercise of rural industry and the growth of corn. On the other hand, if this iron is to be smelted with wood, the extent of the manufacture, however desirable in other respects, would greatly increase the demand for fuel, or of land to be kept in perpetual forest, and would in like proportion lessen the agricultural resources of the Province. The existence and possibility of profitably working beds of coal in New Brunswick, is as important therefore to the agricultural as it is to the other interests - to the development of the agricultural resources of the different parts of the Province, and to the formation of anything like a correct estimate of the extent of these resources. In reading over Dr. Gesner's reports in regard to the Geology of the Province, I have been struck with the labour he has felt himself obliged to expend year after year in exalting the dignity of geological science, its money value in discovering natural resources of a country, and its consequent claims upon general consideration and support; like all men whose fate is to pioneer the way to new views, new studies, and new habits of thought, he evidently writes as if he felt his work to be very much up-hill - as if he were labouring for men who did not generally understand or appreciate his task, and he was therefore induced occasionally to minister a little too strongly to the vulgar views of immediate profit from scientific enquiry, and thus to create expectations which his own labours did not realize. This was especially the case in regard to the richness of the coal fields of New Brunswick. From all I have seen or learned, the opinions he expressed and the hopes he awakened on this subject were much too sanguine and in a considerable degree exaggerated. This proved unfortunate in many ways; it has not only injured his own reputation for general accuracy, and diminished the confidence with which his Reports generally were read, but it lessened the confidence of the people in the predictions of the science generally, and probably prevented or retarded other researches which might have been undertaken in reference to the Geology and Mineralogy of the Province. With a view to placing before Your Excellency at a glance, a summary of all that is yet known of the coal deposits in New Brunswick, I have requested my friend Dr. Robb to fill up the following table, (No.1). The materials are derived chiefly from Dr. Gesner's reports, but the principal observations of Dr. Robb and myself are also included. From this table and the report annexed to it, it appears that nearly all the seams that have been discovered are very thin, that such as are thicker are represented to be poor in quality, and that very little coal has yet been extracted or is likely to be profitably obtained from them. Many of those varieties called cannel and gascoal appear to be only bituminous shales which leave an ash nearly as bulky as the original coal. The gas coal ofthe Memramcook River is of this kind, and its quality for the manufacture of gas may be judged of from the fact that a ton of it yields only a thousand pounds of gas, as tried in the Saint John gas works, while the best qualities of English and Scotch cannel, and of Behimmon's coal from the County of Durham in England, yield 12,000 cubic feet. The discovery said to have been made of a thickbed of bitumen on Frederick's Brook, in Albert County, is very interesting, and should reports not be exaggerated, will undoubtedly prove a source of profit. Fredericton, 26th Nov. 1849 Sir. - In compliance with your request that I should prepare a ""short notice of the existence of coal in New Brunswick, and its consequences in the Colony as derived from my own observations and enquiries, and the published reports of Dr. Gesner,"" I have drawn up the following Report:- More than one third of the area of New Brunswick is occupied by rocks whose composition and contents, both 3 mineral and fossil resemble those peculiar to that which as a whole has been termed the Carboniferous system of rocks. A great portion of the space occupied by them, say seven or eight thousand square miles, has been termed by Dr. Gesner the ""Great New Brunswick Coal Field."" Its area is very considerable, although it is not ""one of the largest ever discovered upon the globe."" (Rep. IV. p.64) The Illinois coal field, says Sir C. Lyell, is about as large as the whole of England, (Travels in N.A., I.28;) and the area of the Appalachian coal field, according to Prof. H. Rogers, ""upon a moderate estimate amounts to sixty three thousand square miles."" (Trans. Assoc. Am. Geology, I. 436). The carboniferous rocks of New Brunswick form but part of that series, which as a whole has been termed by Mr. Logan and others the Eastern coal field of North America. The rocks of this series first appear on the northern margin of the Bay de Chaleur, (and probably at one period occupied the whole of it,) thence pass deeply into the interior of New Brunswick and Nova Scotia, and constitute no inconsiderable portion of the Islands of Prince Edward, Cape Breton and Newfoundland. The rocks or measures which constitute this system are conglomerates, sandstones and shales of various degrees of fineness and purity, and of various colours, but all obviously deposits from water. Subordinate to these we have beds of limestone, coal and plaster, and occasionally ores of iron, copper and manganese. In many other countries there is a very exact line of demarcation recognized between the rocks of the coal series and those above and below it, but in this country there is still considerable difficulty in defining the limits of these respectively; and although I consider most of the sandstones, conglomerates and shales of New Brunswick to belong to the carboniferous system of rocks, this term must for the present be construed so as to include the true coal measures and others below them as far as the old red sandstone or Devonian series, as understood by Sir C. Lyell and other Geologists. By the observations of Lyell, Brown and Dawson, in Nova Scotia and Cape Breton it would appear that the carboniferous system of the eastern portion of North America may be divided into three groups or formations, each of which is no less than six thousand feet in thickness, - these are - 1st, an upper, consisting chiefly of reddish measures, with two thin beds of coal and one of gypsum, a middle, which consists of gray and brown sandstone with workable beds of coal and ironstone; 3rd. a lower consisting chiefly of reddish sandstones and conglomerate with a few thin seams of coal, and with much plaster and limestone. In Dr. Gesner's reports on the Geology of this Province, red rocks, or rocks accompanied with plaster, have generally been termed new red sandstone, and have been said to overlie the coal measures; but if the red rocks which contain the plaster, really underlie the productive coal measures of New Brunswick as in Nova Scotia and Cape Breton, and as I suspect they do, a revision of the matter will be required; at present there is much difficulty in making use of this data regarding the order of superposition in this part of our series of rocks. Speaking of the consequences of Coal in this Colony, Dr. Gesner says (Rep. IV, 18) - ""The immense but unexplored deposits of coal in the Province are sufficient to supply Canada and all the demands of the existing coasts of the Gulf; they are capable of sustaining manufactories, railroads and steam communication to an extent scarcely to be contemplated in the present day, and they will also support a trade with other parts of the world."" Further he adds (IV. 64) that ""when it is considered that one third part of this country contains more or less of the bituminous mineral, the quantity of coal in New Brunswick will appear inexhaustible;"" - and in another report to the Legislature, when speaking of the same subject, he says, ""when all the circumstances are duly considered, it may be seen of what importance New Brunswick is destined to become, not only to herself and her sister Colonies, but to great Britain and the United States, whose supplies of Coal must, to a great extent, be dependent on these colonial resources."" (III. 36). In order to afford more definite ideas concerning the beds of coal actually known to exist in the Province, and to enable us to estimate at its real value the ground work of the many vague assertions which from time to time have been made concerning this department of our mineral resources, I propose to bring together short notices of all the known outcroppings of coal in the different counties of the Province.York.-1. An outcropping of coal, resting on fire clay, may be seen at a side cut on the right bank of the River Nashwaak, nearly opposite Mr. McLean's farm; the coal does not seem to be more than a few inches in thickness, and could not be worked with any profit there. 2. On the Tay Creek, a branch of the Nashwaak, coal has long been known to exist. In walking up the stream, from its mouth, drift pieces are found occasionally, and then become larger and more abundant till we reach a bend in the river, under a high bank of gray sandstone, above which no more coal is observed; hence it is supposed that the outcrop is near, and as it is not in the cliffs it must be in the bed of the brook, where, however, I did not detect it. Some of the pieces found near this place were about ten inches thick, though it is possible that 5 the proper seam may have been thicker. The dip of the sandstones was easterly, and very low, so that the coal may have been connected with the seam seen on the Nashwaak. 3. I have a specimen of coal from land near McLeod's Hill, on the Royal Road; but I am informed, on good authority, that the seam from which it came is thinner than either of the above. 4. Dr. Gesner (IV. 26) considers ""it is far from being improbable that coal might be procured at the very capital of the Province, although the rocks themselves offer but few indications of its existence near the surface."" As the rocks near Fredericton have an easterly dip, and as there are no appearances of coal in the sandstones, which run out a short distance to the westward, we are hardly warranted, as yet, in supposing that coal will ever be mined at this locality. 5. I have long understood that coal has been got on Lyon's Creek, a small tributary to the Oromocto River, and that it had been used by a blacksmith near Hartt's Mills; on making further enquiry, however, I found that it was only a few inches in thickness, and therefore unavailable. I presume that this is the bed alluded to by Dr. Gesner, (I. 71) of which he says, ""the coal is only four inches thick, and appears on the bank of the river between strata of bituminous shale, where fossil remains are abundant; that there are thick beds of coal beneath, however,"" he adds ""there can be no doubt."" Enough is said to excite the imagination, but not to satisfy the reason. Sunbury. -Exploratory surveys and boring for coal were undertaken some years ago in the Parish of Burton, but in no case, I believe, was workable coal discovered. Queen's. -1. I have understood that some borings were made near Gagetown, but they were unsuccessful. Dr. Gesner (I. 73) observes that ""no doubt can be entertained that Coal may be procured in the County adjacent to Fredericton and Gagetown."" This remains still to be seen. 2. Coal has been got on the Grand Lake for upwards of forty years, but as yet there are no workings of any extent in any part of its valley. The coal occurs near the head of the Lake, and at present it is chiefly worked on the Shore Road, south of the Newcastle Creek; the workings are either open to the day, or adits run in from the side of the hill, on the rise of the measures, which dip towards the lake at an angle less than 10ø. At one of the levels the section observed by me was as follows:- Clay drift of surface 8ft. 0in. Shaly sandstone 1 6 White clay 0 8 Fire clay 4 0 Coal with pyrites 0 4 6 Black clay (sheepskin) 0 1 1/2 Coal (main seam) 1 3 Underclay (pavement rock) unknown ---------15 10 1/2 At another place, where the measures were seen at a ""stripping,"" or open digging, the appearances were as follows:- Red clay 1 ft. 1 in. Soft yellow clay 3 6 Hard yellow clay (coal rock) 3 0 Blue shale 1 6 Coal 0 4 Black clay 0 2 Coal 1 6 Underclay unknown --------11 0 As may be supposed, the mining operations are all carried on in a small and rude manner, yet, from time to time, I believe that nearly 2000 chaldrons per annum have been brought to market. Within twenty years all the coal was got by strippings, or open diggings, but since that it is chiefly got out by adits and levels; of these there are a great many on the Newcastle Creek, on Salmon River and on Coal Creek. The settlers of the vicinity used to go into these mines during the winter instead of going into the woods. Messrs. Berton Brothers of Saint John, have recently taken out mining leases and wrought the coal on a somewhat more extensive scale. The coal is bituminous, and cakes or fuses when heated, so as to form a hollow fire admirably fitted for blacksmith's use, but less for ordinary grates, without frequent stirring. The Grand Lake coal now brought to market is much better cleaned from pyrites (""sulphur"") and clay than it used to be formerly, and I believe that it is preferred by the Saint John blacksmiths to any of the imported varieties. The uniform quality, thickness and depth of the coal got at the Lake district, lead to the conclusion that one bed only has been opened as yet. Dr. Gesner says, however, (III.72) ""there can be no doubt that there are other and far richer deposits of coal beneath the one already discovered, but at what distance from the surface it is impossible to calculate, in consequence of the almost horizontal position of each stratum in the coal series."" If the outcrops of other and far richer deposits of coal had been known - if they had dipped towards the quarter alluded to - and if they had not suffered much denudation, the above expression would have been more justifiable than they appear. An exploratory boring was undertaken in 1837, by the Salmon River Coal Company, at a cost of œ2000, but 7 the returns (supposing them to be correct) gave but little promise of upwards of 400 feet, and in this Distance a few thin seams of coal were passed through, and one of bituminous shale and coal, 8 feet thick was reported; nothing further was done, and the company broke up. 3. Coal has been found on the Washademoak River near the mouth of Long's Creek - its thickness is about a foot, and according to Dr. Gesner (III. 60) ""is probably accompanied by more valuable deposits than have yet been discovered."" 4. Coal has also been reported as occurring on the New Canaan River, another branch of the Washademoak, but it is not unlikely that both this and the former may be part of the same bed as that seen at the Grand Lake. King's. -1. In Dr. Gesner's second report (p.63) it is mentionedthat the rocks of the Westmorland coal field occur at Ward's Creek, a small stream which flows from the south and joins the Salmon River at Sussex Vale. At the farm then held by Mr. A. Sheck he reports ""a stratum of impure cannel coal, about three feet in thickness, and from the qualities of this kind of coal mingled with the debris of the surface, it is evident that it exists in much greater quantities and a quality more pure in situations now concealed by beds of sand and other detrital matter."" This stratum, accompanied by a fine grained sandstone, containing remains and impressions of plants of the coal period, was observed towards Dutch Valley, and, as Dr. Gesner adds, ""although the largest and most important beds of coal remain undiscovered, yet an advancement is made towards their development."" (p. 64) In 1847 I had an opportunity of visiting the farm mentioned above, and then I found a brownish bituminous shale or slate in contact with a sandstone containing remains of what appeared to be fucoids. We made a wood fire, and got the former to burn; still there was too much earthy matter present to entitle it to be included under the head of coal. Albert. -1. In the Pollett River about fifteen miles from where it joins the Petitcodiac river, small seams of coal appear in its bed, and some drift coal is found in theneighborhood. Dr. Gesner (II.65) observes in regard to this case ""that it is abundant in the concealed strata beneath, appears very evident."" Coal may or may not be abundant underneath, although it is hardly fair to require us to admit that it is very evident that it is either one or the other. 2. In the following pages of the same Report, coal is stated to appear at the head of Turtle Creek, and ten miles N.N.W., from Shepody; it was likewise seen on Mr. Stephens' land where a stratum of coal ten feet in thickness was observed in the bed of a brook; the coal 8found in this vicinity is said to be of a much superior quality to any along the whole line of outcropping, it kindled quickly, and afforded a greater quantity of carburated hydrogen gas than any of the imported varieties. The earthy matter varied in quantity from twelve to twenty-five per cent, and the ashes contained carbonite of lime. The outcrop of this coal was within five hundred yards of trap and syenite, which form a steep and high declevity along its southern edge to the distance of ten miles. Although the proportion of ashes above stated is very large, the above mentioned stratum must be regarded as one of considerable importance, and I regret that I had not an opportunity of seeing it with you when we were in Albert county together. It ought to be tried experimentally at the Saint John gas works or elsewhere. 3. Dr. G. (III. 28) mentions the occurrence of a bed of coal at Frederick's Brook, a branch of Weldon's Creek, which flows into the Petitcodiac river, in the Parish of Hillsboro'. It exists, he says, ""in several separate strata, the largest of which is about nine feet in thickness."" The quality of this coal is stated to be superior to that of the Memramcook or Stephen's farm, mentioned above; a quantity of it was collected and fired in the bed of the stream, it ignited readily and burned with great splendour; the strata consisted of sandstone, slate, bituminous shale and coal which ran E. and W. with a southerly dip. I visited this place in October last, and found on Mr. Steeve's land, near the bend of Frederick's Brook, a good deal of brownish bituminous shale, but no coal whatever. Subsequent to the period of Dr. Gesner's Report, a boring had been made for coal by Messrs. Bryant and Sherer; we saw some of their old works near the edge of the brook where they had bored to a depth of 40 feet, but without finding any coal. Mr. Steeves showed me what had been regarded as coal, but it proved to be Mineral Pitch or hard bitumen; it had only been found, he said, in small rolled fragments in the surface drift of his fields. The occurrence of this mineral in New Brunswick is interesting, but it was impossible for me in a hurried visit to attempt to discover its proper site. 4. Coal occurs on Mr. Richardson's land, at Cape Enrage, in Chignecto Bay; you yourself visited it in October last, and informed me that it was of the common kind, about eight inches thick, and occurring with the usual shales and sandstones, which dip at a very high angle; that the coal section was very good, and that if other beds had existed, besides the above, they would have been readily seen. (II.23) 5. At Salmon River, further west, and on land belonging to Mr. Foster, coal was spoken of also, but it was said to be impure and of small extent. 6. On the south side of Grindstone Island, Dr. G. reports 9 ""several seams of soft red shale with narrow seams of coal."" The course of the strata is W., and the dip S 40ø; although there are indications of coal at several localities, no out-cropping of any practical value was discovered on the shore. (-- 25.) Westmorland. -1. On Taylor's farm on the west side of the MemramcookRiver, four miles above Dorchester, there is a good natural section of the coal measures; the dip is S.S.E. and nearly 40ø. Here occurs a bed of highly bituminous shale 4 1/2 feet thick, into which an adit has has been made by Mr. Steadman; it ran in, on the dip, for forty or fifty feet, and if followed much farther in the same direction would issue below high water mark; about 200 tons of the mineral were piled on the bank for shipment. It is easily set fire to and blazes readily, but leaves an ash nearly as bulky as the original piece. Scotch cannel leaves about 4 per cent. of ashes. I have heard that this substance has been tried at the Saint John Gas Works, but was not considered suitable there; it ought to be tried again. Dr. G.

N.B. Courier - Sep. 23, 1837 LETTER II. To His Excellency Major General Sir John Harvey, K.C.H. and C.B., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May it please your excellency; Having in a former letter, and as briefly as possible, endeavored to give an account of the rocks of the Coal Measures on the west side of Chignecto Bay, and to notice some of their most important characters, I now proceed to the examination of the deposits in the direction of the main road leading from Cumberland to Saint John. There is an inconsiderable ridge of grey sandstone extending from Fort Cumberland in a northeast direction. Along the lower grounds at the base of this eminence it was proposed to open a canal, to communicate with the Bay De Verte; and certainly the situation is most favorable for that object, for advantage may perhaps be derived from a considerable lake, and as the country is low and level, there would be but few difficulties to encounter. Leaving the boundary line between Nova Scotia and New Brunswick southward, the road passes four miles over the great Tantamarre Marsh, one of the greatest collections of marine alluvium in North America. This alluvial deposit extends from several small lakes,situated some distance in the interior of the country, to the head of Cumberland Basin. It is fourteen miles long, and averages about four miles in breadth. Through it the Tantamarre winds its way to the sea, sweeping forward both on the ebb and flood tide the talus which can no longer find a resting place on the banks of a river brought to its narrowest limits by the constant accumulation thus conveyed. Already surcharged with disintegrated sandstone, the river in times of freshet, sends back to the sea the surplus sediment which is fast accumulating at its mouth, and will in time convert Cumberland Basin itself into an extensive marsh. Had the coasts of Chignecto Bay been formed of granite or any other crystalline rock, the present site of the great marsh of Sackville would have remained unobstructed, and now cease to extend its boundaries; but the yielding sandstone giving away before the action of the elements, has not only furnished the materials of the deposit already made, but continues its steady supplies for situations still remaining open, and ready to devour each particle of siliceous and argillaceous matter as it is carried along by the influx of the sea. Large rafts of timber have been buried in these marshes, trunks and branches of trees were often observed projecting from the bank at the bottom of the river - they have been discovered twenty feet below the surface - even the bones of wild animals have met this kind or interment, and large masses of rock having been transported by the ice, have fallen into the same common grave. All these, and perchance the works of art that may have been lodged in this wide receptacle, may a thousand years hence afford matter for grave speculation to those who will not consider the changes constantly going forward upon the earth. Great numbers of white wild geese formerly frequented these places, but they have long since disappeared, and but few of the grey variety now make them a resting place in the Spring. The alluvial deposits in this part of the country are extremely valuable. The inhabitants throw up dykes and embankments against the sea, and thus convert the soil formerly submersed by every high tide, into rich meadows; notwithstanding large tracts are in a sunken and neglected condition for the want of proper draining. The tide in Cumberland Basin rises about sixty feet at spring tides, therefore it is practicable to drain even the lowest lots, and the tide can be shut out by proper floodgates. The soil in the Parish of Sackville rests generally on new red sandstone. This rock reposes on the sandstone of the coal measures, and affords plentiful supplies to its numerous inhabitants. Westcok, the residence of Judge Botsford, has the appearance of an English manor. It overlooks the great marsh, and head of Cumberland Basin, and the beautiful villages scattered along the banks of its rivers. From the beds of clay interspersed near the surface, the country is well watered. There are also collections of sand and gravel. - The farms are small, and not remarkable for neatness, notwithstanding when viewed at a distance, and with the gentle eminences over which they are spread, they form a most pleasing landscape, and the small clusters of trees still remaining - affording shelter and shade to cattle and sheep - are instances of considerable foresight and taste. From Sackville to Dorchester, a distance of nine miles, the road passes over more elevated land; the grey sandstone of the coal measures often containing the impressions of leaves, and other vegetable remains, is predominant and breaking out beneath the Court House of the latter village, forms a considerable declivity. At some places the rock is covered with a soft conglomerate and red sand, which afford a less fertile soil than the red marly rock of the lower lands. Dorchester and its river were formerly called Memramcook. The principal village stands on a slope, where several grist and saw mills are propelled by the brook descending towards the river. Looking southward, Shepody Mountains appear lifting their tops far above the rocks of the carboniferous order. Judging from their appearance at a distance they are composed of primary and transition formations; and probably like the Cobequid chain in Nova Scotia, (of which they may be said to form a part), they are the southern boundary of the vast coal district of the Province. The Memramcook river extends in a north direction until its ultimate branches meet those of the Shediac on the Straits of Northumberland. The marsh along its banks is twelve miles long, and embraces four thousand acres. The alluvium here is like that of the Tantamarre, having been derived from the same sources, and collected by the same causes. The upland farm lots all join the marsh, and are well cultivated, forming a broad band down each side of the river. From many points the view is delightful, and characteristic of the Acadian inhabitants, who still retain the French language, habits and costume. Four miles northward

of the Court House, there is a bed of limestone interstratified with the sandstone. It would be an excellent auxilliary as a manure, were it applied, and is admirably adapted to the soil of the country, where it has been deposited. Having carefully examined the alluvium of the marshes already mentioned, they were found to contain a much greater quantity of silicious, and less argillaceous matter than those of Hants and King's Counties, in Nova Scotia. These circumstances are readily explained, when it is considered that the marshes of Westmorland are composed of pulverised grey sandstone, while those of the most fertile of the other province consist of disintegrated new red sandstone, which from its containing a greater quantity of marl produces more luxuriant crops. The deficiency of calcareous matter in the extensive marshes of Tantamarre and Memramcook, might however be readily supplied by the application of lime. There are numerous blocks of granite scattered on the surface of this country; from whence they came it is difficult to determine, when so little is known of the geology of the Province. It is most probable nevertheless that they have been exiled from the primary rocks forming the Shepody Mountains, by the force of water which has evidently submerged the country at some remote period in the earth's history. From the bridge over the Memramcook to the Petitcodiac, a distance of ten miles, the sandstones of the coal measures rise to the surface. Here, as in many other situations, the frost, rain, and vicissitudes of the weather, have produced a dilapidation of their strata, and a light sandy soil is mixed with the detritus formed under the more active operations of causes which have long since subsided. The soil thus formed, principally of silicious matter, is by no means productive, and instead of the sugar maple, beech, and yellow birch, the meagre white maple and spruce have here fixed their residence. A number of French families reside on the road, and as is usual with them their farms are General;
small, and their dwellings humble. Arriving at the Petitcodiac river from the eastward, a tolerable high ridge of land will be seen to the northward, and a chain of mountains extending from Shepody appear stretching away to the southward and westward; detached boulders of granite increase in number on approaching this large stream, and collections of fine yellow sand; and beds of clay, may be seen by the road side. This beautiful river, following a serpentine course in a north east direction, turns at almost a right angle at a place called the 'Bend of Petitcodiac', from thence it extends southwest until its branches meet the forked extremities of the Kennebecasis. At the angle thus formed, there is a considerable village, with an excellent landing place for timber, deals, and other productions of the fertile and well populated country in the neighborhood. At high water the scenery is very pleasing, and bears a resemblance to some of the splendid views on the Thames and Mersey, in England; but at low water its imposing effect is lost, and the empty chasm, with its muddy banks, have a disagreeable and gloomy aspect. In this river the tide runs with great rapidity, often opening new channels and sweeping away large collections of sand, and undermining the alluvium produced by its singular powers. So great is the distance over which it must pass in the space of a few hours, that its increasing volume on the flood, particularly at Spring tides, is greater than its speed over the gently inclined 'flats', hence it rolls forward in a foaming tidal wave, sometimes six feet high, sweeping the river with a rush of water like that of a coming deluge. - The effects of such powerful causes appear obvious, in the estuaries of Shepody Bay and Cumberland Basin, where the increasing collection of sand and shingle are undergoing pulverisation to fill more quiet situations with the sinking sediment. Large trees, pieces of timber, and quantities of vegetable matter, drifted from the marshes above, lie buried in these moving sands; wrecked vessels and boats also add to the materials covered in these fearful wastes, over which at high water the largest ships may pass in safety. I have not had the opportunity of measuring accurately the height of the tides in the Petitcodiac, but am of the opinion its highest limits will exceed seventy five feet. Large quantities of marsh on the river have been rescued by dyking, and now yield a plentiful supply of fodder for cattle. The new red sandstone at Sackville, extends in a southwest direction to the ""Bend"", where it is occupied by a number of farms, sloping down the higher grounds on the borders of the marshes to which they are attached. From the Bend of Petitcodiac to Nixon's Inn, a distance of 12 miles, the road extends along the north side of the river. The soil became sandy and light; instead of birch, beech and maple; larch, white and yellow pine inhabit the surface. I have observed that the pine always selects a loose sandy soil, which not only affords it a larger growth, but allows its roots to extend to great distances, thereby affording greater security in gales of wind. The more hardy spruce will 5 send its roots in the narrow crevices of rocks, and cling to a footing where other plants would fall before the breeze. The sand along this road lies directly on the rocks of the coal measures, and often forms collections of considerable depth. On a branch of the Petitcodiac called PollettRiver, and about six miles form the main road, there isan outcropping of coal, which has been intersected by theravine giving passage to that stream. The coal has beenemployed by a blacksmith in that neighborhood, and I regret that I was unable to devote sufficient time, and expense, to ascertain the probable quantity there deposited. I observed a quantity of the argillaceous oxide of iron (clay iron stone) not far from the coal, and it is probable that there is a sufficient quantity of those valuable minerals in the vicinity of this river, at least to support an iron foundry. But considerable time and labour would be required for their full discovery and development. The subsoil in this part of Westmorland is light and sandy, having been derived from the sandstone placed beneath. Blocks of granite, syenite, and porphyry, are common on the surface, and seem to increase in Frequency as the road diverges towards the mountainous land situated a few miles from the coast of the Bay of Fundy. Among the pines I observed a number of red bellied woodpeckers, the Picus Carolinus, a rare bird in Nova Scotia. They are covered with a beautiful plummage, but are very destructive to the groves of pine, as this kind of wood offers but a feeble resistance to the horny beaks of these industrious animals. Between Nixon's and Holstead's Inns, there are some good farms, and instead of the marshes formed by the influx of the sea, The Peticodiac passes through a band of intervale formed in the course of past ages by loose soil, and decayed vegetables, swept down by torrents of rain descending from the neighboring hills. Pursuing its course in a westerly direction, the new red sandstone, four miles northwards of Holstead's Inn, forms a long belt of rising ground called ""Butternut Ridge"", on which there are several new

and flourishing settlements. The red marly rock at this place contains beds of limestone, gypsum and rock salt. Several springs take their rise, and send forth large quantities of water highly impregnated with the saliferous mineral. The importance of these deposits to agriculture should not be overlooked, and the design of the Creator of the Universe in supplying salt far from the briny waters of the ocean, and granting lime to enrich the soil are among the exalted acts of his allwise Providence. The limestone contains the remains of numerous shells belonging to the sea. These point out the relative age of the rock, and the peculiar circumstances of its original history. Most of the species of these moluscous

Codes: P3 / IDX_Names: Albert Lime, Phosphate and Brick Company;
Daily Telegraph - Aug. 9, 1878 Demoiselle Lime. - The enterprising Thomas McHenry, Esq., and associates are carrying on with vigour and success their lime manufacturing interests on Demoiselle Creek. The article is universely pronounced as being of most superior quality by competent judges, and many local inhabitants having used it, attest to its superiority. Large shipments are being made to the leading enterprising interests of the province, and to meet the demands the parties concerned are sparing no pains. A branch railway, of 400 feet in length, is now being built from the main Albert Railway line to the works. This promises to be one of the leading industries of the county if not the province."

Codes: P3 / IDX_Names: Albert Lime, Phosphate and Brick Company;
Moncton Daily Times - Feb. 1, 1878 Albert's Lime and Fire Clay. - We learn from the Post that Mr. Thomas McHenry, having secured a limestone area in the valley of Demoiselle Creek, on the line of railway, two miles below the Albert Mines, proposes to have kilns constructed and a grinding mill erected, - and the manufacture of lime commenced. Mr. McHenry also proposes to have Albert fire-clay, found on the property of Mr. Hugh Steeves, near the Albert Mines, developed. The potters of Brantford, Ont., and of New York, and by Mr. Devoe, of St. John, have tested this clay, and their report is very encouraging. It is valuable for fire-bricks, pottery, pipes, etc."

Moncton Daily Times - Nov. 16, 1878 ADVERTISEMENT: Albert Lime. -- This Lime is Superior to all Other Limes in the Market, Having peculiar Cementing qualities that are not possessed by other Limes. It has the following advantages: 1st. - It sets without hair, and is stronger than any other mortar with hair. 2nd. - It sets quickly and becomes harder than any of the ordinary Limes. It nearly equals Cement in hardness and does not crack. 3rd. - It does not granulate like other Lime mortar on being broken. 4th. - It is well adapted to use in cold weather, as it hardens before it has time to freeze. 5th. - For stone and brick work it is unequalled in strength and having hydraulic qualities it is just the thing in damp and wet situations, - requiring no addition of cement. 6th. - It will make more bulk of Lime in slacking by 25 per cent.; take more sand and make more mortar than any other Lime in the market. Try It! Received by rail direct from the Kiln in Albert and sold as low as any other Lime by A.J. Babang, Moncton, And Albert Daniels, at Railway Station, Salisbury."

Chignecto Post - Oct. 3, 1878 A company with a capital of $100,000, in shares of $100 each, called the Albert Brick, Lime, and Cement Company, and having its offices at Hopewell, has been formed for the purpose of quarrying, manufacturing, and selling of lime, hydraulic and other cement, marble, pottery, glass, fire and other brick, tiles, water and sewer pipes, and other articles from stone, rocks, clay, sands, with such other earths and things as are incident to the

Moncton Daily Times - Sep. 28, 1878 The Albert Brick, Lime and Cement Co. - In the last issue of the Royal Gazette it is officially certified that Martin B. Palmer, Thomas McHenry, F. Milton, and George Calhoun, all of Hopewell, County of Albert, and Arthur Fletcher of St. John, have filed in the Provincial Secretary's office a memorandum of Association for the incorporation of a Company to be styled The Albert Brick, Lime and Cement Company, for the purpose of quarrying, manufacturing, and selling of Lime, Hydraulic and other Cement, Marble, Pottery, Glass, Fire and other Brick, Tiles, Water and Sewer Pipes, and other articles from stone, rock, clays, sands, with such other earths and things as are incident to the attainment of those objects, with a capital of $100,000, to be divided into one thousand shares of $100 each. The Office or principal place of business of the Company will be at Hopewell."

Chignecto Post - Aug. 7, 1879 Hopewell.- Mining operations are about to be begun in two places in the parish of Alma, one up the brook road and the other on the McKinley farm. It has long been known that Alma was rich in copper deposits and the prospects now is that the parties who have leased the property mean business. Mr. McHenry has struck it at the Creek, in the discovery of immense quantities of Phosphate of Lime. Things are looking up and have good reason to hope that the long-looked better times are in the near future."

Chignecto Post - Dec. 4, 1879 ...The Albert Lime Works flooded some time ago and destroyed by fire are again in full

Daily Telegraph - Jan. 24, 1879 Albert Brick, Lime & Cement Co. -- This company having been duly organised, and the undersigned appointed Manager, Notice is hereby given that all business transactions on its account, must have his sanction before binding the Company. Orders for Lime or other business transactions will be addressed: Thomas McHenry, Manager A.B.L. & C. Co., Hillsboro, A. C. Dated the 1st day of January, A.D. 1879."

Chignecto Post - Jul. 31, 1879 Albert Notes.- … At the Lower Cape is the Hopewell Brick Yard, a new enterprise, lately entered upon by Mr. Wm. Blacker, formerly of Hillsboro' Mines. He has good clay, sand, a brook of water and every natural advantage to make a superior article of brick. He intends making his shipments at Hayden's wharf, 1 1/4 mile distant. His kiln is 24x24, 20 feet high, and 12 feet thick, made of brick. He has moulded this season, 113,000 brick, the first batch of which are still in the kiln but will be ready for shipment on 1st of August. He is making some handsome looking pressed brick. Mr. Blacker employs 10 hands. The yearly capacity of the yard he estimates at a million brick. He has been at a heavy expense, and it is hoped he will receive such encouragement and support as will render it a

Moncton Daily Times - Jun. 5, 1879 and Daily News - Jun. 6, 1879 The New Albert Lime. - We are pleased to learn that the lime manufactured by the Albert Brick, Lime and Cement Company, whose enterprise we have previously noted, is rapidly finding its way into different parts of the Province and is coming to be largely used not only for building purposes but also as a fertilizer. Containing ten per cent. of phosphate as ascertained and vouched for by undoubted authority, it needs only to be tested by agriculturalists in order that its great merit may be appreciated. Unquestionably it is destined to be regarded as the very best available fertilizer of its class in these Provinces. For architectural purposes also it ranks very high and has won the approbation of Mr. Stead, the Government architect, and other competent authorities. We are glad to know that the Company are now manufacturing on a large scale and pushing their enterprise with great energy. They must eventually find an extensive market and a profitable business. We commend this lime to the attention of both agriculturalists and builders, confident that they will find it in all respects worthy of the high character that chemists,

Daily Telegraph - Jun. 26, 1879 Albert B. & L. Co. - Mr. McHenry, manager of this company, is certainly deserving great credit for the energy and enterprise in this industry of the company. Several specimens of valued worth have been recently exhibited, of this abundant composition of superior lime and cement in this quarry. For agricultural purposes, and otherwise, orders from St. John, Sussex, Moncton, and other places are daily delivered. To farmers, builders, and masons we most sincerely commend the adoption of this highly valued product for the purposes intended."

Chignecto Post - Mar. 15, 1879 Albert Brick, Lime and Cement Co.- The following are the officers: A.E. Killam, President; George Calhoun, Secretary; Elisha Tingley, Treasurer; M.B. Palmer, Esq., Directors; T. McHenry, Manager."

Codes: P3 / IDX_Names: Albert Lime, Phosphate and Brick Company;
Moncton Daily Times - Jan. 8, 1884 Equity Court. - The Albert Brick, Lime and Cement Co. vs. James Nelson and Wife and Frank M. Steeves. - Judge Palmer gave judgement in the above case on Tuesday last, dismissing the bill with costs. It appears that defendant Nelson owned lime rock land in Albert Co., which he leased to John F. Milton for 5 years from

Dec. 8, 1877, at a rental of $15 per annum, with agreement to sell if demanded by lessee for $500. A year later deeded lease to the Albert B.L. and C. Company, with a proviso that his wife Agnes Milton should receive a royalty of 5 cents per ton on all limestone taken from the property. The Company paid the rent one or two years and then did not pay, and according to the evidence of Nelson, McHenry the managing director told him that the company did not want the property and would not pay the rent, when Nelson, in order to raise money, mortgaged it to Sir Albert Smith for $500, and afterwards conveyed the part of it east of Spring Brook to Nelson's wife, and Sir Albert assigned his mortgage to one Snow, who Nelson agreed to let quarry stone on the property. McHenry, for the company, afterwards tendered $500 and demanded a deed to the company from Steeves, Nelson and his wife. This they refused, requiring him to produce an authority from Milton to authorize them to do so. This suit was brought in October, A.D. 1882. The defence claimed that the company had no right to the deed until they carried out the condition of the assignment of the lease and that the company had no legal existence at the time the demand was made."

Moncton Daily Times - Oct. 3, 1884 Albert County. - Atkinson & Son, of Albert, shipped a carload of Albert lime from the kiln at McHenry station, for the post office and custom house at Newcastle last week. They are also supplying the post office and custom house buildings at Amherst and Moncton."

Moncton Daily Times - Jul. 17, 1885 Albert Co. - The replevin suit of Thomas McHenry vs. John F. Milton has been settled and the property returned. Mr. McHenry has sold his stock in the Brick, Lime & Cement Co. to A.E. Killam of

Moncton Daily Times - Apr. 12, 1893 The Late Thomas McHenry. - Hillsboro, April 10. - Many of your readers will, perhaps, be quite ignorant of the fact that your paper under the title of the Eastern Advocate had its birth in this village and that Thos. McHenry, who was laid to rest in the burying ground of the R. Catholic church, Albert Mines, on Friday, the 7th inst., was at one time editor. Thomas McHenry was born in Fredericton on May 10th, 1819. His father at that time was a sergeant major in H.M. troop 74th regiment, an Irishman from Antrim and his mother from Dublin, a Miss Carruthers. After his education was completed he entered commercial life, at one time owning and building ships in St. John. In 1854 he commenced a general store in that city and made hardware a specialty. 1863 found him in Salisbury managing an oil business for an English firm whose headquarters on this side of the Atlantic was Boston, Mass. In 1863 he moved to Mary's Point, Albert Co., and promoted the Salisbury and Albert railway association with C.D. Archibald. He used all his efforts by pen and voice to advocate the I.C.R. and confederation. He was a Free Mason. As editor he filled the chair of two other papers besides the one named, the Colonial Empire, published in St. John, and the Christian Visitor. He was thrice married, first to Miss Jerusha Masters of Bath, Maine, of their family, two daughters survive, Mrs. William Irvine, of Brooklyn, N.Y., and Sister Lena McHenry of St. John's Hospital, N.Y. The daughter of Rev. I.E. Bill was the second wife and six daughters are still living, Mrs. Crandall, U.S.; Mrs. William Smith, Ottawa; Mrs. James Gardner, Mass.; Mrs. Benj. Vaughan, St. Martin; Mrs. Trarte, Washington Ter.; Mrs. H.J. Olive, Carleton. What a pity he had not died rich, then his third wife, Miss Margaret O'Connor and her four sons and four daughters would have had the pleasure or reading eulogies, without number, on the checkered life of their father and husband. Jasper Cottage, Demoiselle Creek, was the home of Mr. McH. since he formed the Lime Company, that ascribed all his capital. He began life as an English church man, subsequently joined the Baptist church, and over a year ago was rebaptised and publicly admitted into the fold of the Roman Catholic church at Albert Mines, in company with his friend, Dr. Chandler. He was a most interesting talker, with a memory equalled by few, until impaired by paralysis some months ago."

Chignecto Post - Jan. 31, 1878 Mineral Development in Albert Co.- Perhaps no part of Canada displays a more varied and richer exposure of mineral ores and earths than the little county of Albert. Convulsions of nature in the earlier ages of the earth's history have tossed up the strata in every direction, placing within the reach of man the hidden treasures of the earth. Our readers are familiar with the almost fabulous wealth yielded by the bituminous deposit known as Albertite; with the Albert shales, which, though unproductive at present, will probably form a source ofwealth in the future; with the plaster quarries, which, developed by Messrs. Tompkins, is the leading industry inthe county; with the building stone, manganese and marls,which are all more or less a source of wealth. To these minerals, Albert seemed destined to have two more important additions made through the exertions of Thomas McHenry, Esq. The upheaval of Shepody Mountain has disclosed, according to geologists, the sub-carboniferous formation, the oldest of stratified rocks except the Devonian Series. During the ages when the sub-carboniferous rocks were in process of formation, the following substances were also formed in their order, viz: (1) lime, or carbonate; (2) gypsum, or sulphate; (3) gypsiferous sandstone, (4) salt; (5) bitumen, (6) bituminous shales, (7) Albertite. All these substances, except salt, have been found in the valley of Demoiselle Creek. Mr. McHenry secured some time since a limestone area on the line of railway two miles below the mines, which, from the fact of being thrown up in cliffs, seemed to offer superior facilities for quarrying. Mr. McHenry proposes to have kilns constructed, a grinding mill erected (for which purpose there is a fine water power) and the manufacture of this article on a large scale commenced early next season. Mr. McHenry also proposes to develop a large bedof clay that exists near the Albert Mines on the property of Hugh Steeves, Esq. No. 1 fine clay is imported from England. New Jersey furnishes an inferior article. It is used in fire-bricks, pottery pipes, etc., in making articles to withstand heat. The Albert fire clay has been tested at Brantford, Ont., by Devos at St. John and by potters in New York. Their report is highly encouraging. The position of these properties - their easy accessibility from all parts of the Maritime Provinces - the easy facilities for transportation by land or water - the cheapness with which they can be developed, owing to the abundance of wood and to water power, render them particularly valuable. These mineral resources will not only furnish a traffic for the railway, but will develop a wealth many times the entire cost of the railway. Such resources are a justification for the large expenditure of Government money for railway purposes."

Daily Times - Oct. 6, 1880 Exhibition. - The Geological Department. - On entering the main building the first branch of exhibits that meets the eye is that of mineral deposits found in New Brunswick. Some five glass cases are filled with this class of exhibits, and it is surprising to know what a large number of valuable mineral deposits this Province possesses. Prominent among the exhibits of this class areseveral blocks of Albertite, from the Albert Mines at Hillsboro, the great value of which may be readily seen on comparison with other species of coal. There is also apillar of polished shale, of a species resembling cannel, found at Caledonia, A.C. Besides these there may be seenspecimens of peat, St. John, granular anthracite, foundat Lepreaux Basin, Charlotte, all combustible materials, and silver and lead ores, the latter in many cases being labelled with paper, and a table given showing the relative quantities of valuable minerals to be abstracted from each. Following up the exhibits in this line, but to be found in other parts of the building, should be noticed two large blocks of Spring Hill coal, from the Spring Hill mines in Cumberland County, N.S., each block containing several square feet, and the exhibits of greyand brown freestone, quarried in Albert and Westmorland Counties. There are two separate exhibits of grey freestone and one of brown freestone. Messrs. J.M. Steeves & Co., Albert County, show four specimen blocks of grey stone quarried by them, and the Budro Company, operating at Dorchester, in Westmorland County, show a large block of grey freestone. A. Stevens & Co., whose quarry is situated at Mary's Point, Harvey, A.C., show three blocks of brown freestone, in an unpolished state, merely having the rough edges broken off."

Codes: P8 / IDX_Names: Thorn Brook Graphite;

Weekly Record - Fri., Nov. 11, 1902 The Canada Paint Company of Montreal having lately acquired the valuable graphite property at Thorne's Brook, in Kings County, some seven miles from Havelock, are getting ready to mine the ore on an extensive scale. It is a good vein 14 feet wide and 30 feet deep. No attempt has been made hitherto in the direction of the development of the property. Sheds have been erected for the cleaning and drying of the graphite. It was necessary to construct a bridge to enable the ore to be conveyed from the cliff where it is located to the sheds. It is expected large quantities of graphite will be forwarded to Montreal next year for use in the manufacture of paint. Ten men have been engaged in the preparatory operations, and it is thought quite a number will be kept on permanently. - St. John paper."

Carleton Sentinel - Aug. 4, 1852 and St. Andrews Standard - Aug. 4, 1852 MARBLE QUARRY. - We are informed that a valuable quarry of Marble, of an excellent description, has been opened near Point Le Preaux in this County, by a

Company of enterprising Americans, who have purchased the land on which the marble is quarried, from one of our townsmen at a fair price. It is said that the proprietors have reasonable prospects of doing a remunerative business. - ST. ANDREWS STANDARD."

Morning Freeman - Jun. 9, 1860 New Brunswick Marble. - We have been shown a piece of Marble taken from a quarry lately opened at Musquash, by Mr. William Campbell, Architect and Builder of this City, which is pronounced by competent judges to be equal, if not superior to any ever imported into this Province. We understand that in the quarry as now opened 15 he has three different qualities, viz., the pure white, equal in clearness and polish to the best Italian; the blue veined and mottled, a beautiful sample of which is before us, that will compare favorably with any Italian, and the green striped. We have been assured by the enterprising proprietor that he can get out and dress this Marble, suitable for fronts of buildings, as cheap as the Granite which is so much used in this city. Mr. Campbell intends entering largely into this business and has already got out a considerable quantity of very fine blocks, he is also erecting suitable machinery for cutting and polishing it. We wish him every success in his undertaking. - Nbkr."

S.J. Daily Sun - Mar. 9, 1886 Arthurette. - The Proposed Tobique Valley Railway. - ... But there is, I think, a brighter future for the Tobique Valley. The value of its great mountains of plaster is only beginning to be known. Farmers from Carleton County, Aroostook and Madawaska, haul the plaster a distance, in some instances, of 80 miles with their teams. They find it necessary to raise root crops with profit. It will pay 50 per cent. On hay crops and will pay a large percentage on grain sowed on sod land. The farmers find after experience that the Tobique plaster is possessed of greater fertilizing properties than what is known as the Nova Scotia plaster. There is also abundance of lime stone, said by masons to equal

Codes: Y1 / GYP / LIME / E5 / IDX_Names: Salt Springs Salt; Gypsum; Lime - General; Sussex/ Plumwesweep Salt;
S.J. Daily Sun - Mar. 26, 1888 House of Assembly. - ... Mitchell committed abill further relating to Mines and Mining Leases. He said the bill proposed that carbonate of lime, sulphate of lime, or gypsum shall not be subject to any royalty to the crown. The second section proposed that the governor in council, upon being satisfied on the report of a mining engineer, geologist or other competent person, that there is a reasonable probability of discovering valuable mineral deposits in any part of the province by boring, sinking shaft or other methods of exploration, may on the recommendation of the surveyor general by order-in- council, authorize an expenditure out of the public moneys of a sum not exceeding $2,500 in any one year, in and of or for the purpose of prosecuting such boring, etc., and the surveyor general's annual report, shall contain full statement of exploration if any, the expenditure therefor, and all other such information. Another section of the bill gave the governor in council power to cancel mining leases when certain conditions were not complied with. Speaker Pugsley said he was glad to see the government making a move in this important matter. During the election in Kings his colleagues and himself had promised if elected to do what they could to aid in the development of the mining interests of the country. This bill was intended to advance the mining interests not only of Kings but of the whole province. That being so he had no doubt it would meet with general approval. It had been shown that Kings county was rich in manganese and salt deposits, and there were indications of coal there in paying quantities. With proper encouragement, mining in Kings county must be attended with good results. This bill does not propose to take away the rights of those interested in mining. Its effect will be to enable the surveyor general in proper cases to go to a certain expenditure with a view to assisting the mining industry. As he had said, the bill was a move in the right direction. Tweedie said the bill did not propose anything new. The province has had an experience in this direction before. They all remembered what the diamond borer had cost and that the deepest hole it ever bored was a hole in the provincial treasury. Under this bill $2,500 would be given to some county, Kings perhaps, for nothing. The section empowering the cancelling of leases was an improper one and he instanced cases where under it an injustice might be done.Attorney General Blair said it was possible the amount named would not be advantageously expended. The Government had thought it a duty to make the experiment of aiding in mining development, and, though the sumproposed was small, the result might be very satisfactory. If the salt deposits of Kings are as great and valuable as it is said they are their development would be an immense advantage to the whole of New Brunswick, and the amount of revenue to the province would be very handsome. The bill, however, did not intend to apply only to Kings, but to any other part of the province where there was reasonable evidence to warrant an expenditure by the surveyor general. Speaker Pugsley again referred to the salt deposits of Kings County. Valuable springs coming direct from the rock have been discovered in different parts of the county. The brine from the Sussex and Upham springs contains salt of the purest character and farmers are willing to give twice as much for the salt from these springs as for Liverpool or Ontario salt. There is every evidence that these salt deposits exist over the whole area of the country from Sussex to Hammond River. If the salt rock can be discovered, its development would no doubt be attended with most satisfactory results, in which case the royalty of the province would be large. The salt deposits of Syracuse, N.Y., had given to that city a population of 50,000 and a royalty to the State of New York up to the present time of $5,000,000. There was no reason to suppose that with proper encouragement the salt mines of Kings County might not be equally valuable to that county and the whole province. Hanington said he wished the proposal to aid in the mining development of the province every success. He referred to the efforts of private individuals to develop the mines of Albert, and expressed the opinion that if properly worked the mines of New Brunswick would produce gratifying results. Heatherington said his bill reflected the highest credit upon the surveyor general. He would heartily support it,

because it was intended to help the development of the mines in Queens and other counties in the province. ..."

Union Advocate - Jun. 25, 1873 Limestone from Newcastle to P.E.I. .... Limestone from Chatham to P.E.I. .....Stone for Boston from J. Goodfellow ....."

Daily Telegraph - Oct. 3, 1874 Albert County. -... Lower Cape. - From this place the Freestone of the Hopewell Quarry Company is shipped, although the spot is not a very favorable one, and the stone has to be carted down from the quarries, a distance of three miles. ... Hopewell Quarry Company. - Three miles from Lower Cape, in a northerly direction, are the Freestone quarries which bears this name. The quarries are about a mile from Demoiselle Creek, at the mouth of which, as already stated, the stone is shipped. The company is an American one, and commenced operations June 24th, 1872, in the lower quarry on the south side of the present one, which was worked for half a year. About this time last year they begun in the upper quarry. The property includes about 400 acres, and the quarry has a face of 200 feet, with a depth of 75 feet, the working rock being 30 feet deep. At the end of the season the quarry is expected to be about 200 feet square, and they have now about 1,000 tons on hand, which they are busily engaged in shipping. They supply stone for the culverts of the railway in the section from the Albert Mines to Hopewell, of which 1200 tons have already been forwarded. The Company mainly find a market for their stone in Boston, where freestone of good quality brings $16 per ton. The quarrymen are mostly French, and are accommodated in a large boarding house, which, together with the store, is some distance off on the main road, in the Curryville settlement. This year the operations have been somewhat slack on account of the strike of the stone-cutters in Boston, and also for want of railroad transit. ...... Marble Works. - The visitor is somewhat surprised to find that marble cutting is extensively carried on here, there being two establishments, those of Mr. John C. Tingley and Mr. Josiah Tingley. Here tombstones are manufactured for the inhabitants of Albert County, and in point of workmanship, taste and originality of design, they would compare favorably with those of metropolitan establishments. ..."

Codes: Z2 / LIME / GEOL / IDX_Names: Sandstone, Building Stone, Monument Stone, etc.; Lime - General; Geology - General;
Colonial Farmer. - May. 29, 1871 Geological Report. - Continued. From the escarpment of the mountain the ground slopes tothe southeast at a low angle, probably in conformity with the dip of the underlying grey grits, which flank the narrow coping of trap. Near the bridge the river divides into three branches, and on the northeast branch, about one and a quarter miles from the Forks, occur the Falls of Nashwasis. - Here the brook, running in a picturesque gorge formed of nearly perpendicular cliffs of yellowish grey sandstone, 100 feet apart, and about the same height, falls over course silicious conglomerate rocks, forming a cascade of forty feet high and fifty feet in width. Both the cliffs above, and the conglomerate forming the bed of the stream at the fall are copiously charged with vegetable fossils, such as leaves and stems, the latter sometimes of considerable thickness, the bark being converted into coal, and the core replaced by sandstone; nodules of iron pyrites are also very abundant. Although such traces of carbonaceous matter abound, there seems to be nothing to justify the expectation, which has been entertained by some of the neighboring residents, that a workable seam of coal may be found here. Rumours were current also, when I visited the locality, of veins of manganese and even of more valuable ores having been found on McLeod's Mountain, together with great deposits of fine red ochre in the vicinity, but as they were not met with by me, I am unable to give any details. Just below the fall there is a

considerable development of a pure white siliceous conglomerate, composed entirely of large quartz pebbles, and without a grace of organic remains. From the mouth of the Keswick, northeastward as far as Tay Settlement, a distance of fifteen miles, the hardness of the outcropping edges of the grey grits and conglomerates, combined with the unequal effects of superficial denudations, produces a very marked topographical feature, forming a succession of nearly 10 parallel ridges running northeast and southwest as far as the valley of the Nashwaak, and all of very considerable elevation up to 900 feet above tide water. Most of the rock exposures observed by me in this district have been recorded on the large map, and need not be here repeated. In this intervale the red rocks are nowhere conspicuously displayed, owing to the relief of the surface, the nearly horizontal attitude of the strata, and the soft nature of these rocks themselves. In the valley of the River Tay, however, they reappear in considerable breadth, as might be expected from the fact of its cutting the formation traversely. At Beone's Mills, about eighteen miles from Fredericton, on the north branch of the Tay, and near the road between Cardigan and Tay settlement, fossiliferous and highly ferruginous grey grits occur in alternating massive and shaly beds, dipping SE 7ø, with specular iron and impressions of large and small obscure fossil vegetable remains. A little further north, at the bridge over the south branch, thin bedded micaceous red sandstones appear, dipping SE apparently 17ø; this is at the junction of the red and grey rocks. Proceeding one and a half miles northward on the road, we find at the bridge over the North Tay, the contorted and nearly perpendicular slate and quartzite of the unconformable metamorphic rocks, seamed with quartz veins, and slightly calcareous, but only so in streaks and bleaches. On descending the stream (but ascending in stratigraphical order) the slates become gradually more calcareous, arenaceous and micaceous, and assume a red colour, till at a little over half a mile below the bridge, they are covered by the unaltered bed of red marl and conglomerate, dipping SE 7ø. The section afforded in the bed and banks of the Tay is tolerable complete distinct, cutting nearly transversely to the direction of the Carboniferous rocks, extending for a distance of about ten miles from their base, and including two small seams of coal. Where coal has been found the seams themselves are concealed, and neither the quality nor conditions of occurrence of these coal seams have been accurately established; but their appears no reason to believe them to be of any economic importance, as no true underclays have been found in this section of the country, and even the continuity of the coal beyond the spot where it has been found has not been ascertained. Between Tay Settlement and Stanley, on the Nashwaak, on the land of Robert Thorburn, an interesting exposure of the red calcareous conglomerate and underlying metamorphic slate rock, in vertical section, is afforded in a small ravine or gorge. The slate rock at and for some distance below the plane of contact is also calcareous, and seamed with strings of quartz and calcspar; in the same neighborhood this rock was manyyears ago successfully burned in a kiln for lime. A similar conjunction to the last is well observed, though in horizontal exposures, in descending the River Nashwaak, where, about a mile below Stanley Bridge, the slates, reddened and rendered highly calcareous towards the contact, are overlapped by the red conglomerate, sandstone and marl, which continue uninterruptedly in descending, for a distance of one and three quarter miles, equivalent to a thickness of about 1000 feet; and terminate near the mouth of Cross Creek, there giving place to light-grey sandstone and conglomerate in massive beds. At Red Rock settlement and also at the mouth of Cross Creek, eruptive masses of trap protrude through the red conglomerate near the summit. At Nashwaak Bridge, on the Miramichi Road, thin-beddedflaggy grey grits are seen on the bed and bank of the river, dipping SE 5 deg.; and the same rocks are occasionally displayed at intervals along the Portage road to Boiestown. About ten miles from Boiestown the road skirts to a considerable extent, of red conglomerate, terminating towards the east of an eruptive mass of basalt similar to that at Clarke's Mountain, but more vesicular. It forms the height of land on the Portage, and is about three-quarters of a mile wide, terminating at Clearwater Brook, a tributary of the Taxis River; the other dimensions and precise form of the mass have not been fully ascertained. From Boiestown eastward for three or four miles, the right bank of the Southwest Miramichi is flanked by an amphitheatre of the coarse grey sandstone rising to the height of 200 feet above the river, and dipping SE 5ø; the line of this escarpment is considerably to the south of that of the bluffs at Keswick, Cardigan, etc. Near the mouth of the Taxis River, which flows into theMiramichi a little above Boiestown, a small seam of coal about three inches in thickness was reported. Four miles up the Miramichi from the mouth of the Taxis, the horizontal grey fossiliferous sandstones overlie red conglomerates and marls, dipping 67 deg. to the southeast. This high dip, of which some of the beds of the grey grits also seem to partake, may be due to a fault; in corroboration of which hypothesis the underlying metamorphic slate is usually full of veins of quartz and calcspar, as if much fractured; but on the other hand it is to be noted that with the observed horizontal breadth of the red rocks (400 yards) the thickness would closely approximate to that usually obtained for the red rocks, (1000 feet). The grey sandstones near this locality yield very fair though rather fine-grained grindstones; and some of the red

S.J. Daily Sun - Mar. 1, 1889 Hopewell. - ... (The Rocks) - The cape is best known to sailors as a conspicuous point on the coast during several hour's sail, and ashore for its interesting scenery. Though not as grand as the Giant's Causeway, Fingal's Cave, or the Palisades, yet it is easy of access, well worth seeing, and adds materially to the pleasures of a summer holiday. It is on the west side of the bay mentioned, has a water front near to low water mark of about one quarter of a mile, with a height of 100 or 150 feet. The south end is bold, the north end forming a gentle slope to low ground. This point is reached by a carriage road, and here an array of water worn columns of rock 20 to 30 feet high above a smooth, sloping beach, met the eye while the shore wall is seen to be honeycombed with caverns. Farther down shore past projecting reefs and recurring recesses, as the headland rises, the outstanding masses grow more lofty andimposing, occasionally approaching the height of themainland, with a diameter of 30 to 50 feet. Some areapparently solid and several rods away from the bluff,others parted off by a fissure a few feet wide and rifted from top to bottom, with their bases riddled by long oval shaped passages which here and there almost undermine a towering and ponderous slab. The tunnels, galleries and caves differ in size, shape and form. Here is one roomy as Dan O'Connell's acts of parliament; the next with scarcely standing room, while another has 20 feet of space between its floor of sand and pointed arch overhead. They run parallel to each other at times, or cross at right angles. Some go straight through from daylight to daylight, others by turns and surprises, or now and then end in the cliffs too far and too dark to be explored without a light. The rock at these peculiar places is chiefly a fine grained, tough, dull red, conglomerate, alternating with other layers of red sandstone, and coarser conglomerate, all containing a proportion of lime, which appears to be the cementing ingredient between the layers as well. It pounds up more readily than it splits or breaks and is an unwilling stone to give up specimens. Probably it was formed without flaws, but irregular lines of cleavage now run up and down through it at varying distances apart. These cracks have evidently marked out the isolated portions and located the caverns. Atmospheric agencies, the surf, and the beach pebbles, burrowing in the crevices have done the rest. No caves a mile long and necessarily earlier formed, of which written descriptions and traditions tell, could be found. Fractures similar to these would reasonably account for the remarked absence of living springs over a considerable area of neighboring country. Down shore at the southeast corner two regular wall like ledges of blue limestone reach under the tide and in shore rise in a precipice. Here a pile of large square blocks have ground upon each other showing the marks of the waves' tremendous force. This is the most enduring stone of the group and contains curiously worn arabesque pieces, with veins resembling bunches of grapes. The Cape rocks seem to be older than the fossil marked sandstones at St. Mary's Point and Hopewell Cape, on either hand, on the same shore, but widely separated. ... Close by Cape Demoiselle Creek empties into the bay. This stream gives its name to the country through which it flows. One branch takes its rise near the once famous Albert mine. Large deposits of gypsum, freestone and limestone, with indications of salt are found along its course; freestone and lime stone have been extensively quarried. These facts, with the name as a connecting link, seem to call reference to them. .... Though prospecting to any extent for albertite has ceased, and in view of an estimated expenditure of $100,000 by several American companies in trial pits and borings outside Albert mines limits, yet there is a lingering and quite general hope that the lustrous mineral will crop out at some unexpected place and time."

Codes: Z2 / P3 / IDX_Names: Sandstone, Building Stone, Monument Stone, etc.; Albert Lime, Phosphate and Brick Company;

S.J. Daily Telegraph - Apr. 24, 1879 Albert Co. - From Demoiselle Creek. - The stone quarry, of which Mr. Hayden is manager, is now operating with a large force of men, and likely to do a good business during the season.The lime and brick company, Mr. Thos. McHenry, manager, will doubtless give employment to a large staff, as it is rumored they are to begin operations in a few days."

S.J. Daily Sun - Oct. 18, 1881 Albert County Sketches. - Walls of Jasper - Lime Burning and Stone Quarrying - McHenry and the N.B. Freestone Co. - On the border land, between Hillsboroughand Hopewell, are the quarries and kilns of the Albert Brook Lime and Cement Co. The nearest railway station is called McHenry, in honor of the manager of the works, Mr. Thos. McHenry, one of the most widely known of Albert's prominent men, and there is a branch, a half mile long, to the kilns. The company owns 100 acres of limestone and freestone land. This is the fourth year of its operations, and it burns three or four thousand casks yearly. It has been supplying the Penitentiary, and its lime is highly spoken of for building purposes. It is also a valuable fertilizer, as it contains ten per cent. of phosphates, and half of the whole product is sold to agriculturalists. The kilns are lined with firestone, one of the products of the district, which contains so much silica that the action of the heat makes it look like glass. The N.B. Freestone Company, having slackened operations at its old quarries, at Curryville, because the color of the stone there is not of the hue most in demand at present, secured some land adjoining that of Mr. McHenry's company and opened a freestone quarry on it. The quarry is on the side of a hill which rises abruptly from the little valley in which the lime works are situated, a short distance further up the brook which winds through the narrow strip of level land between the hills. The hillside has been opened near the top, and the quarrymen are working downward, leaving a perpendicular wall of stone. This wall is the boundary between the company's land and a lot of which Mr. McHenry has a lease, with the privilege of purchase. The Freestone Company bought up a mortgage on it, but Mr. McHenry has tendered the money for the mortgage and the land and considers it as good as his. He may, therefore, go on and work his own share of the quarry, or join with the N.B. Company. The whole hill, about three acres in extent, is composed of freestone. The greater part of that which has been exposed is lavender brown, the most popular color in the United States; but there is also olive and a handsome light gray, said to be the same as that of which Paris is built, which is so soft that it may readily be carved with a knife, but gets hard after exposure to the atmosphere for a few months. The stone in this quarry is of fine texture, and free from faults and imperfections. It lies in natural benches, with the lines of cleavage distinctly marked, and it is wedged off into as large blocks as are required, some of them weighing eight tons. These are easily hauled by one horse to the foot of the hill, over a steep path along its face, on wooden drags, and an extension of the McHenry Branch Railway, twenty chains or 2,000 feet, will give access to the Albert Railway. Part of the road bed is graded, but the work upon it has been suspended in consequence of the dispute with Mr. McHenry about the mortgage on the land he holds and the company wants. The settlement of this dispute will be followed by the building of the railway extension, and then the shipment of the stone will begin. Mr. McHenry feels, as Dr. Johnson said of the brewery, that the quarry is the potentiality of wealth beyond the dreams of avarice, and he looks forward to becoming a millionaire in the future. Although not clean past his youth, as Falstaff said of the Chief Justice, he hath yet some smack of age in him, some relish of the saltness of time, and has lived an active and laborious life without reaping much reward. All who know him will be glad to see his present hopes realized. Geologically speaking, Mr. McHenry says, this region is of sub- carboniferous formation, and flanks the Huronian, which crops out above the freestone. Metals of various kinds are found at the junction between the two, and people who have been there lately prospecting have washed gold out of the sands of the brook. On one side of the brook there is freestone, and on the other side limestone. The latter is overlaid by a vein of jasper, about a foot thick, from which many beautiful specimens, suitable for jewellery, have been obtained. The stream is called Hayward's Brook, but Mr. McHenry has named it and the district Jasper Brook, and is looking forward hopefully to the time when he will be rich enough to build Jasper Cottage, and dispense therein a generous hospitality to his friends. Mr. McHenry is a man of sentiment, and will have at least the

Salt Springs Salt; Albert Mines;

S.J. Daily Sun - Oct. 22, 1880 Interest in Mining. - The increased interest which is being taken in mining matters in the Maritime Provinces is rather remarkable in its way. Some very important gold discoveries have undoubtedly been made in Nova Scotia, and in fact there is scarcely a County in that Province in which gold has not been found. The greatest practical development of recent date is probably in Halifax and Yarmouth Counties, where a good deal of mining property has changed hands and some new works are being profitably prosecuted. The oil lands of Cape Breton are now attracting the attention of capitalists, and, as already pointed out in the Sun, immense tracts of land around Lake Ainslie have been secured by Boston and Halifax capitalists, besides what has been taken up by that giant oil monopoly of this continent, the Standard Oil Company. A very large amount of machinery and labor will presently be at work in the development of these oil properties. In our own Province, there have beensome important investments by Boston capitalists in antimony mines at Prince William, York County. Mr. Hibbard, it is reported, has sold the mine in which he is interested for $200,000 cash and $50,000 stock in the new Company and a large force is at work on the property. The Lake George antimony mine is also a hopeful speculation and it is anticipated that the present managers will make a large amount of money out of it, especially as silver has been discovered in the ore. On the Tobique, gold has been discovered in sufficient quantities to warrant an expenditure for pushing forward a thorough exploration.The Woodstock iron mine, as our readers are aware, has changed hands, and large expenditures will be made in developing the property. The Queen Manganese company are not hesitating in incurring large expenditures for the development of their valuable property at Markhamville, while a manganese property in Hopewell has been bought by a local company, and efforts are being made in Boston to organize a company to take hold of the manganese mine at St. Martins. Copper has been discovered back of Dorchester, and the lands are duly bonded, and some Sussex parties have secured a copper mine at Point Wolfe. Kings County is turning out strong in the line of mineral discovery. At Wanamake's, Parish of Upham, galena, which is said to bear both silver and gold in paying quantities has been found. The extent of the vein requires to be still further tested. The Salt Springs of Campbell Settlement have come into notice and changed hands, and a Mr. Bockus, for Boston parties, is putting up the necessary machinery for salt making, and it is expected that operations of some magnitude will be carried on here. Kaolin has just been found at Hamilton's Lake, Dutch Valley, the bottom of the lake being composed of this valuable clay, which is used in making porcelain. At or near Dutch Valley, too, according to a well authenticated statement, indications of oil have been found. Dr. Goodfellow, of Sussex, has found a mineral which appears to resemble bismuth more closely than anything else, but just where it is found has not been made public. Graphite is known to exist in the Parish of Upham. It is to be hoped that through the present extraordinary revival of interest in our mineral resources some practical good may be accomplished. That the Maritime Provinces abound in valuable minerals can not be gainsaid. The trouble heretofore has been the absence of capital to fully test the extent of these resources. In the West and elsewhere it frequently happens that millions of dollars are expended in explorations and actual working before any tangible, paying result is reached. Here there are no millions to be expended in this way - nor even hundreds of thousands, and scarcely tens of thousands. Unless practical miners and geologists are entirely wrong, this very Province of New Brunswick contains all the conditions of a country in which the precious metals, as well as the ordinary minerals, should be found. Possibly the present active enquiry may stimulate to such persistent, thorough survey and exploration of our Province as may lead up to discoveries the benefits of which may be felt by our entire population."

Daily Telegraph - Jun. 15, 1881 Economic Minerals of New Brunswick. - Although New Brunswick is inferior to Nova Scotia in minerals, it still is entitled to consideration in that respect, and it is not improbable that at some not distant day we shall see some new developments in connection with the mineral wealth of this Province. A few words now, (in answer to severalcorrespondents) in regard to the useful minerals of New Brunswick which have been so far discovered. The coal areas of the Province are very extensive, and although the seams are thin, not more than 22 inches, and only worked at Grand Lake and one or twoother places, it is quite possible that they may have eventually be worked much more extensively. It is estimated the Newcastle coal basin alone contains upwards of 100,000,000 of tons, most of which could probably beobtained. When St. John becomes a great manufacturing city this coal will no doubt form an important factor in its prosperity. The Albertite has had a great history, but present appearances are unfavorable to that mining interest. There are several seams of anthracite in theDevonian strata at Point Lepreaux and also at Musquash. It has, however, not yet been determined whether these seams can be worked with profit, owing to the large amount of ash left after combustion. Copper ores have been found in many places inCharlotte, in Albert and elsewhere, but, so far, have not been worked with profit. Baryta, used for making, or rather for adulterating white lead, has been found at Frye's Island, Charlotte Co., where also galena and silver have been found. Minute quantities of gold have been found from time to time in several localities, but nothing has beendone in the way of mining. Argentiferous galena has been found in several localities. At Wannemake's, on Hammond River, the galena has been found to yield a fair proportion of silver. In 1878, on the west side ofMusquash harbor, yellow sulphuret of copper and galena were found in veins of white quartz, to the amount of $14 per ton, as was shown by actual assay. The hardness of the rock and the smallness of the vein are, however, against its profitable working. Considerable quantities of silver have been found in the same locality. Bituminous shales are found extensively inAlbert, Kings and Westmorland, capable of yielding from 65 to 90 gallons of crude oil to the ton, but they are of little value so long as petroleum is so abundant. Bog iron ores, believed to be of commercial value, have been found at Burton, in Sunbury, and also at Maryland in York. Large deposits of iron ore of very superiorquality are found at Jacksontown and other parts of Carleton County. Some of these samples have yielded as much as 48 per cent of iron. There seems to be no doubt that these mines will eventually be worked with profit. Black sand containing magnetic iron ore has been found at St. Martins, in the vicinity of St. John, and elsewhere. Antimony is found in great quantities in PrinceWilliam, York. These mines are worked with profit and the quality of antimony is excellent. It is largely used in making Babbit metal. Manganese is another profitable New Brunswick mineral. It is found at Markhamville, Kings County; in the County of St. John, on the South West Miramichi, and elsewhere. In addition to these minerals, there are manyothers more or less widely distributed. Clay fit for bricks and pottery is abundant. Granite in various colours is widely distributed in Charlotte and Queens, and red granite is largely exported to the United States and Upper Provinces. Graphite, or black lead, is foundnear St. John, and also in Queens county. Grindstones and freestones of the best quality abound, especially about the head of the Bay of Fundy. Gypsum is also abundant inAlbert and Westmorland. It also occurs in Kings and St. John Counties and on the Tobique. Kaolin fit for the manufacture of pottery is found in the granite districts of Charlotte. Limestone is abundant and is found of the best quality about St. John.Iron pyrites is found on the St. John and Miramichi. Saltsprings exist at Sussex and in the parish of Upham. There are other minerals of less value which might be named,but these we have mentioned are sufficient to show that the mineral wealth of the Province is by no means inconsiderable. A survey made with a view to practical economic results, rather than a mere scientific survey,

Daily Times - Mar. 28, 1887 New Brunswick Mining Items. - A correspondent of the Halifax Critic writes to that paper: I have been roaming considerably of late, with not much chance for corresponding. Mining matters in New Brunswick are not very brisk at present. Owners of manganese properties and other metal hope for a satisfactory boom a little later on.The developments at what is known as The Glebe manganese deposit in Dutch Valley District are still satisfactory. The owners are very much encouraged indeed. A Mr. F.J. Alley, of Bar Harbor, Maine, is the principal promoter of this mine, and the development operations have been done under the superintendency of Mr. W.N. Goold, who has had extensive mining experience in this province as well as across the line.The work at Mineral Vale, in Albert County, is progressing satisfactorily, and some English capitalists are to come out from London or Liverpool and look over the property. Messrs. Breeze and Robinson, of St. John, N.B., are largely interested in the matter. At the village of Albert, (formerly known as Hopewell Corner), mining operations have been for sometime in progress, under direction of a Mr. Sargent, of Boston. It is understood machinery will shortly be placed, if not already done, and that owners anticipate good results. it is said that quite a remunerative amountof gold is had from the ore which is being extracted. The manganese property at Petitcodiac, I am told, is showing up very fairly. The manager, Mr. Brown, was very ill some little time ago, but, I presume, is gaining ground again. There seems to be an impression that this will develop into a good paying property. In Hillsboro, or near there, operations are being conducted under the direction of Mr. Pendegrast of Truro. It is said to be some kind of a mineral paint -umber, ochre, or something of that kind. Not knowing correct particulars I will not endeavour to be too positive on the matter. I do not know that I can take up more of your valuable space at present, and can only express the wish that your Nova Scotian correspondents would be more confiding, and let the mining world know what is going on in their different localities. I regret there has been no concerted action by mining laws of Nova Scotia. Perhaps the present session may develop something new."

S.J. Globe - Jul. 11, 1889 A Visit to Golden Gulch. - Gold, Silver, Anthracite Coal, Specular Iron and Moss Litter. - Musquash is only a few miles from St. John, and yet how few of our people have any idea of the treasures that are hidden in the earth at that quaint village, awaiting only the push and pluck of some venturesome persons to make our country a busy hive of industry. Having heard of the vast mineral deposits of that locality, and having an hour or so to spare, with a couple of friends, a visit was paid to Musquash. The first object of interest is the large ice houses on the banks of Spruce Lake. The houses are full, and the owners expect to make a big thing on ice when the weather gets warmer in the United States, and the demand for cool drinks becomes brisker. The nextobject of commercial importance is the barrens. The number of people who year after year trod the plains gathering the large and juicy blueberry and disposing of them at five cents a quart, had not the faintest notice of the ingredients of the bog, or that it would ever be worth $15 a ton. But such seems to be the fact, or at least I was so informed. When the proper machinery is put in position, someone will make money, and moss litter will have an upward tendency with a good marginal profit. Moss litter, no doubt, is good enough, but after all it is nowhere compared with gold and silver mines. These are the things to put mettle in a man, and when one awakes in the morning and looks out of the gable end window over his own gold field, he feels as if he was somebody. Lunch had been taken, when an invitation was accepted to visit the gold and silver mines. Of course nothing else was talked of but gold and silver - how could there be? When one is going to see the genuine article. Our guide was an enthusiast, and each alone was scanned minutely. After leaving the main road, we made a circuit via a cow path to the gulch. Everything was as quiet as it could be, except the mosquitoes; not the sign of a faro bank, nor a bunco steerer; not even a miner with a red shirt was visible - no gambling dens, and even our enthusiast wore a boiled shirt. These matters might make a difference to some, but the hope that a nugget might be found banished all those minor affairs. The gulch was at last reached. It is probably sixty or seventy feet long and about forty feet wide, with nearly perpendicular cliffs at either side. As we stood at the entrance our enthusiast said, Isn't it something wonderful, and each nodded his assent. At our feet was the white silver bearing quartz, and above us in the side of the cliff was the gold quartz. Quite an excavation had been made at the bottom of the gulch, but the recent rains left considerable water in the cutting. A lot of quartz had also been taken from the face of the cliff. A crude ladder was mounted, and the veins of the precious inspected. Small pieces of quartz were chipped off and saved; also pieces of silver quartz were gathered up. No nugget was found, however, but any quantity of quartz. There was no crusher around, and in consequence we had to take home the gold and silver in the rock. This is a good way to keep those metals at home. Speaking of the mine, we were told that a ton of gold quartz produced metal to the value of $21.39, and the silver quartz, $32.00. An expert offered to come from New York and make a thorough examination if $500 for expenses were guaranteed, but the owners, for certain reasons, thought it best to expend that amount in getting out specimens to send to Boston to be assayed. Operations will be commenced again this week. The owner, we were informed, was offered $60,000 for the mine last year, but he refused to sell under $75,000. Of course we all believed that the mines were the real thing, and when shown specimens and asked if we ever saw the like before? we answered readily in the negative. Whatever doubts we had about the gold producing qualities of Musquash, they were quickly dispelled, when an old man said in answer to a question: Nova Scotia produces gold, and why not New Brunswick? This settled the matter, for it seemed to us, if Nova Scotia can produce gold, New Brunswick can do the same. Argument here was out of place. With reluctance we left Golden Gulch. Our stay being of short duration, we were forced to forego the pleasure of visiting the coal and specular iron mines, but we were surfeited with specimens. There is no doubt of the mines being genuine, and Musquash has a great future before it - so say some of its more enthusiastic inhabitants. Musquash has vast resources in her marsh lands, and it would seem to one who had not caught the gold fever that if more of the land was dyked and properly attended, the returns would make a good show even against a gold mine."

St. Croix Courier - Apr. 5, 1956 Buchanan in Legislature: - Reviews Mining, Forest Conditions in Province. - Fredericton. Lands and Mines Minister Norman Buchanan of St. Stephen reviewed mining ..... making specific mention to Charlotte county ...... Interesting. - The minister said nickel in 'the St. Stephen area' and copper on the 'south coast' of the province were still of interest to mining companies. He did not elaborate. '... Speaking of mining, sir, it is like a story I read the other day of a pink and blue surprise party held in one of the homes and after the lady opened all the parcels she said: 'I will tell you of another surprise, I am not expecting.' That is the way it is in New Brunswick. Nobody was expecting any discoveries would be made here. I didn't mean to be rude, sir. 'We might wonder why these mineral finds were delayed. To put it simply, it was because of the terrific overburden, excepting the Brunswick property which will be mined in the open pit method. 'The great difficulty was that the old methods of prospecting wouldn't apply. Prior to the discoveries in New Brunswick, geophysics was somewhat like water witching. They have proved themselves, they have shown their worth and discovered for us that which is going to be something of great importance. 'In geophysics we simply mean the magnetometer and electromagnetometer air and ground surveys. A magnetometer is a survey which measures the variation in the earth's magnetic forces. By these variations and the measures of the variations, different forces indicate different types of minerals. The electromagnetometer measures the phase difference between the current in the primary field and induced current. The measure of these phase differences then indicates to the prospector that there is a certain mineral there but the amount of it has still to be ascertained. Several Methods. - 'There are other things that contribute - geochemistry, which is the analysis of water and soil which indicate the proximity of minerals. 'There is geobotany which is the analysis of leaves and roots which indicates the proximity of minerals. Discovery depends on all of these things being taken together and studied with the use of maps and the study of geological structure, sir, and a high degree of application and perhaps some luck, because many anomalies are graphitic. 'This must be followed up by drilling to indicate the quantity of the quality. As Mr. Glendenning said, delimited as to attitude and grade of ore all done in logical sequence. This, then is followed by a study of the treatment and disposition of these ores which includes research of processing and separation. 'There has been some suggestion that we should be concerned because so much time has elapsed. When we think of other mining operations of this magnitude we understand that seven to ten years is not long to work out these problems. I do not think we should be disturbed. We should be mindful that the first orebodies were discovered in 1953 and their problems are much more complex. Apart from the known minerals we have also, inthe Moncton area, oil. Mr. Elwell from Boston indicated to me they were having some measure of success. The oil shale has been staked and worked on for some considerable time and we hope the young men working on this will come up with something worthwhile. Nickel Here? - 'Several parties have expressedinterest in our salt deposits.'The gypsum plant in Albert county has added new equipment and it would seem they have stabilized themselves.'The cement plant at Havelock is working full capacity and on last report had a full year's order ahead.'The nickel in the St. Stephen area and the copper in the southern coast still suggest interest tomany of the mining people.'The manganese in the Woodstock area at the moment is being treated in a pilot plant in the Niagara peninsula.'Just recently someone brought me a sample of asbestos and I trust it will prove successful. All this is indeed stimulating to our province. ...."

St. Croix Courier - Mar. 23, 1894…This report also contains a valuable paper on 'The Present Status of the Mining Industries of New Brunswick, by Prof. Bailey, of the Geological Survey of Canada. Referring to deposits of granite suitable for ornamental purposes, Prof. Bailey says: The rock for the latter purpose is almost exclusively obtained from the vicinity of St. George in Charlotte County, where no less than four companies are engaged in fitting and bringing it to market. These with their output for the year 1892 are as follows:- Milne, Coutts & Co., 400 tons averaging $80 per ton … $32,000 Tayte, Meating & Co., 300 tons averaging $80 per ton … 24,000 Epps, Dodds & Co., 300 tons averaging $80 per ton … 24,000 Taylor Bros., 300 tons averaging $80 per ton … 24,000 -- $104,000 This is exactly the same as the output of the previous year. In addition to the above Messrs. Burpee & Co., who up to 1891 had their polishing works at Carleton, near St. John, but who have since removed to Calais, Maine, for the saving of the duty imposed in the States on manufactured rock, and who own quarries at St. George, removed from the latter about 300 or 400 tons in 1892 and probably 200 or 300 tons in the present year. The figures given in the above tables represent the amounts and value after the stone is quarried, dressed and polished, all the firms excepting the Burpees being fully equipped for doing all the work upon the spot. It will thus appear that, as the case of the lime industry at St. John, the value of the product comes almost solely from the labor put upon it. It hence becomes the means of directly distributing large sums in the payment of wages, amounting, it is said, in the aggregate, to about $5000 per month. The granite in the rough state, when quarried, costs about $12, generally, though for getting out large blocks it costs more per ton. The power required for the machinery of the polishing works is cheaply obtained from the falls of the Magaguadavic river, and all the conditions are most favorable for the development of the industry. In quality, as pointed out by the writer as early as 1872, the rock will compare favorably with the best red granite of Scotland. Quite recently, Sheriff Stuart and others are opening up a quarry of black granite in Bocabec, Charlotte County, between St. George and St. Andrews. It takes a fine polish and it is thought, can be readily marketed. There are also varieties of rock, such as felsites and porpyries, occurring in Charlotte county which, when polished, are often of great beauty, but nothing has as yet been done towards their utilization. Prof. Bailey has the following to say, also,concerning nickel in Charlotte: The occurrence of nickel in the rocks about St. Stephen has been known ever since the year 1872, when it was recognized by Dr. Sterry Hunt as associated with chromium in specimens collected and submitted to him for analysis by the writer and Mr. G.F. Matthew. Its presence, however, attracted little interest until the discovery of the nickel-bearing pyrophyllites of Sudbury, Ontario, and their value in certain processes of iron manufacture called attention to the similar deposits of Charlotte county and led to the discovery of nickel in the latter. Following upon this rediscovery it has been hoped that the St. Stephen deposits would at least approximate in value to those of Sudbury, but through delays arising from contested claims and other causes, but little has as yet been done to test their actual capacity. It is probable that this will be done during the coming summer. In the meantime it may be of interest to quote here the estimate of the ore as given by Mr. C.C. Hoffman, chemist of the Geological Survey. A partial analysis gave Nickel ... 1.72 per cent Cobalt ... 0.16 Copper ... 0.34 or, calculated upon material free from all gangue:- Nickel ... 1.82 per cent Cobalt ... 0.17 Copper ... 0.33 Similar ore was also analyzed from L'Etete, Charlotte county, and both are described as closely resembling much of the ore found in the Sudbury district. Specimens of the St. Stephen ore analyzed by other parties, gave results in some instances as high as 2.6 per cent of nickel. The quantity of ore, both at St. Stephen and L'Etete, appears to be large and the facilities for mining and shipment are good. Edward Jack contributed to the report aninteresting article on moss litter, which he says is tobe found in several places in New Brunswick, such as at Musquash and along the shores of the Gulf of St. Lawrence. Nine licenses to search, covering forty two miles, one prospecting licence, and three leases covering three square miles of nickel property, were issued to Charlotte county parties during the year; while one mining licence, covering ten square miles, has been renewed."

St. Croix Courier - Apr. 7, 1892 Minerals of New Brunswick. - Extracts from a Paper by Prof. L.W. Bailey, of the Geological Survey of Canada. - COPPER. - The ores of copper found in New Brunswick include native copper, copper glance, chalcopyrite or copper pyrites, bornite or erubescite, cuprite and malachite. NATIVE COPPER has been reported as occurringsparingly in connection with the basalt traps which form the northern half of the Island of Grand Manan. It hasalso been observed at Clark Point on the Mascarene shore of Passamaquoddy bay, and it is stated to have been found in small quantities along the coast, near the head of the Bay of Fundy. Little that is definite, however, is known of either locality. COPPER GLANCE accompanies the native copper in the traps of Grand Manan, where it has been found in small quantities of Grand Manan, where it has been described by Prof. E.J. Chapman as being sufficiently abundant to give promise of profitable extraction. Little effort, however, has as yet been made in this direction. The same mineral, and in larger quantities, has been found associated with other copper ores at different localities along the coast of Charlotte county, and on the adjacent islands among which may be mentioned Crow Harbor Island, Simpson's and Adam's Islands. It is,however, a less abundant mineral than the species nextdescribed. COPPER PYRITES OR CHALCOPYRITE is the most widelydistributed as well as the most abundant of the copperores of New Brunswick, and has been observed at many localities. The larger number of these occur along the southern seaboard, where a band of copper-bearing rocks, believed to be of pre-Cambrian age, is found to extend, with some interruptions, along the greater part of its length. Others are found in the interior, more particularly in connection with the older schistose rocks or the intrusive masses by which these have been invaded. A detailed list of these localities so far as they occur in the southern part of the province, will be found in the Report of Progress of the Geological Survey for 1870- 71. In the northern part of the province, the most noticeable localities are Bull's Creek, in the vicinity of Woodstock and the Tattagouche River, near Bathurst. InWestmorland county, ores consisting in part of this species occur in connection with rocks of the carboniferous age, near the town of Dorchester. BORNITE OR ERUBESCITE, sometimes known as peacock ore, accompanies the other ores of copper, more particularly about Passamaquoddy bay and the head of the Bay of Fundy, sometimes occurring to the exclusion of other varieties. Where abundant, it constitutes a very valuable source of the metal, and the ore of some of the most promising mines yet opened has been chiefly of this species. NICKEL. - Considerable deposits of pyrrhotitehave for many years been known to occur in different parts of Charlotte county, usually in connection with copper pyrites, but until recently have been considered to be without value. Attention, however, having been redirected to them in consequence of the developments at Sudbury, in Ontario, these have also been found to be nickeliferous, and attempts are now made to test their value. The deposits appear to be large, but, as at Sudbury, the nickel contents vary considerably. A fair average sample of 75 lbs., analyzed under the direction of Dr. Hoffman, of the Dominion geological survey, yielded nickel, 4.718 per cent., the material very closely resembling, according to Dr. Hoffman, a large proportion of the ore at Sudbury, Ont. BUILDING STONES. - Very extensive and valuablebeds of granite, freestones, slate, marble, etc., existsin the province, and in the case of the first two have been largely quarried for exportation, but have not beenthought to require extended notice in the presentconnection. The same is true of another of the rocks or minerals, including limestone, clays, infusorial earths, bog-ores, salt, &c. These may be made the subject of a subsequent contribution. LIMONITE. - In addition to the limonite referred to above as associated with the hematites of Carletoncounty, this same mineral is found at various localities in the form of bog ore. The largest deposits are upon the banks of the St. John river at Burton, in Sunbury county, and considerable quantities of the ore were removed during the continuance of operations at Woodstock, for admixture with the hematites of that locality. Spathic iron is only known to occur in the form of small veins in certain parts of Queen's and Charlotte counties. At West Beach, twelve miles east of the city of St. John, upon the shore of the Bay of Fundy, are beds consisting of red hematite mingled with specular iron ore, while at Black River, two or three miles east of West Beach, some of them with a thickness of 20 feet. They have not, however, as yet attracted the favorable notice of such iron experts as have visited them. Magnetite is not uncommon in the form of scattered grains in the crystalline rocks of the southern counties, and small veins are sometimes met with, but none has

Codes: 0084 / 0669 / X6 / O7 / GEOL / IDX_Names: Serpentine River; Tobique River; Tobique Gypsum; Salt/Potash - Sussex Area; Geology - General;

Colonial Farmer. - Jul. 17, 1871 Geological Report. - Continued. VI. Tobique Valley and Tributaries. In the course of my explorations of last season, I undertook an excursion up the river Tobique and one of its most important branches, the Serpentine, partly with the view of making an examination of the great Lower Carboniferous outlier there, and partly to visit certain lands which had been leased from Government on the latterstream for gold mining purposes. The Tobique is a large tributary of the St. John, falling into the main stream about fifty miles above Woodstock, from the northeast, its general course thus coinciding with the strike of the rocks in the high lands constituting the water-shed between the St. John and the Gulf of St. Lawrence; one of its main branches, called the little Tobique, or Left-hand branch, with a general south-easterly course, connects by a short portage with the Nepisiguit flowing, into the Bay of Chaleurs; while the other or Right-hand Branch, falling into the main 6 river at the same point but from the opposite direction, through a very rugged mountainous country, is, in its turn, composed of two branches, the Campbell and Serpentine rivers. These streams form a junction at the distance of ten miles from the main forks, from which point the Tobique flows through a rich and fertile valley in a southwesterly direction to join the St. John river, a distance of sixty-two miles, following the windings of the stream. On the Serpentine, which had not previously, so far as I am aware, been visited by any one with the special view of ascertaining its geological features, the land leased for mining purposes commences about three miles from its junction with the Campbell River, and extends some twenty miles higher, the stream for the greater part of the distance cutting across the strike of the rocks; but owing to the extreme difficulty of exploring this region, I was compelled to content myself with penetrating about seven miles from the commencement of the leased lands, or twenty miles from the main forks of the Tobique. The main Tobique, for about two miles from its junction with the St. John, flows with great rapidity through a deep, rocky gorge ..?.. coinciding with that of the slates, which dip N 70 deg. W <60 deg.; they are here highly calcareous, and enclose many seams and bunches of pure calcspar. Half a mile higher a narrow band of red and green slate occurs, associated with a tolerable pure compact or massive limestone, containing fossils, apparently in considerable profusion, although only visible on weathered surfaces. Among them, according to Mr. Billings, are Favosites Gothlandia, Atrypa reticularia, and Strephomena perplana, belonging to the Upper Silurian series. Above this the river assumes a course nearly at right angles to the strike, cutting sparingly calcareous but highly ferruginous and contorted brown weathering slate and quartzite, which must underlie those formerly referred to as prevailing at the mouth ofthe river. Small straggling strings of galena were observed at one place filling cracks in the rock, but are of no economic importance, except as indicated the metalliferous character of these rocks. At three and a half miles from the mouth, measured in a straight line on the strike, the soil assumes a red tint from the proximity of the red conglomerate of the outlier; a small patch of which is visible in the bank here, but is again succeeded by the older rocks, till reaching Red Rapids, four and a half miles up, where this formation; apparently identical in character with that mentioned in other parts of this report as the lowest rock in the Carboniferous series; appears in force in the bed and banks of the river, dipping due E. <4 deg., extending over half a mile farther up stream, and forming a steep, rocky channel. About this point the rock exposures are few, and 7 or a distance of nine and a half miles indicate no change, except in the prevalence of finer red calcareo-arenaceous sediments in ascending. - Then, about half a mile below the Wapskehegan, appear red and grey, and green marls, interstratified with blue limestone, all in thin alternating bands, still dipping slightly SE., and extending to the mouth of that tributary; a little above which the limestone re-appears in more massive beds, some being thirty inches thick, interstratified, as before, with red shales or marl, also of greater volume. This is a distance, in a straight line, of fourteen and a half miles from the mouth of the river, and here the outlier attains its greatest breadth, of about nine miles, of which by far the greatest proportion lies on the southeast side of the river. The general character of the limestone of the Tobique outlier is fine-grained, with conchoidal fracture, mottled red and pink and green, but sometimes bluish-grey; frequently lined with calcareous spar, and containing, according to Professors Hind's analysis, 82.6 per cent. of carbonate of lime. Superimposed upon the limestone and marl bedshere, are heavy beds of gypsum, which first appears at the mouth of the Wapskehegan, but in much greater development at Plaster Cliff, a mile and a quarter higher; where, for a distance of 80 or 100 yards, they rise perpendicularly from the left bank to the height of 120 feet. The great body of the rock is an impure, massive but earthy and exfoliating red and greenish gypsum, containing a varying proportion of carbonate of lime and silicious matter; but it is seamed with layers of pure white gypsum and of fibrous selenite, containing, according to the analysis of the late Dr. Robb, 77.7 per cent of sulphate, and 3.0 per cent of carbonate of lime. Nodules of nearly pure carbonate of lime are occasionally met with, imbedded in red gypsum. The whole appears to dip SE at a very low angle, and to be of limited extent, where it abuts upon the river; but I am informed, on competent authority, that the plaster beds are traceable at least four miles up the Wapskehegan, alternating with the other rocks of the series. Two small brooks were observed flowing into the river near the junction of the gypsum and marl beds, the waters of which were decidedlysaline and brackish; this character being, doubtless, derived from salt springs, which however, were not met with. Above Plaster Cliff, for a distance of eight miles, the strata, which are now horizontal, consist, as before, or grey and red sandstone and conglomerate, blue, red and green limestone, and marl; thereafter, at the point indicated, near Phillip's Brook, promontories and low knobs of dark brown amygdaloidal trap appear at intervals among the red rocks on the left bank, becoming more numerous and extensive in ascending the river. The red rocks, however, continue to occupy exclusively the 8 ed and right bank of the river, and occasionally also appear on the left bank, but now with westerly dip, until a point thirty-one and a half miles from the mouth is reached, where the outlier may be said to terminate; although for the last three miles of this distance, or from Blue Mountain upwards, only slight traces of its existence can be detected in the red color of the rocks in the bed of the river, where they are at rare intervals seen in place. Thus the total length of the outlier, measured in a straight line, may be stated at twenty-seven miles; it is of rudely elliptical form, and its total area is not less than 100 square miles. It is bounded on all sides by ferruginous and generally non-calcareous slates and quartzite, its outlines forming a very marked topographical feature, being defined by lofty ridges of the older rocks. A comparison of the rocks of the outlier, both in respect to their mineral character and apparent order of sequence, leaves little room to doubt that they belong to the same series which I have described as laying at the base of the main Carboniferous area of the

Codes: 0087 / 0688 / Y1 / L3 / IDX_Names: Dorchester Copper; Gold Mine Gully; Salt Springs Salt; Beliveau Albertite and Oil / Gas;

S.J. Daily Sun - Oct. 16, 1880 Mining Notes. - Work is still being carried on at the Woodville Copper Mine near Dorchester, in hope of getting to main lead or large enough quantity of metal to prove capable of working permanently and shipping or manufacturing on the ground. The Beliveau Albertite Co. still carry on work,notwithstanding the changes and grumbling of impatient stockholders. It is understood Mr. Byers of Albert Mines fame has visited this mine on a tour of inspection, and though his views are not made public it is thought by outsiders they are generally favorable to its ultimately becoming a success. The discovery of a large body of what is supposed to be silver bearing ore in Albert County, on the Hopper Farm, and bonding of the same by Dr. Goodfellow, of Sussex, and associates for a large amount, causes considerable speculation. What will be the ultimate result is as yet unknown, but no doubt the lessees see millions in it. It is understood that a Dr. Parker of Boston,either by himself or with other associates, has purchased the Salt Springs at or near Campbell Settlement, Kings Co. It is understood they intend developing them on a large scale, and also intend boring so as to get at rock salt if possible that probably underlies that locality. Nova Scotia gold...... ..... A fine vein of Galena ore, containing lead,silver and gold in good quantity, exists at Hammond River, N.B., and is at present leased by some gentlemen in Albert County, N.B. They have bonded the same to a party from Westmorland County, who is now in negotiation with some reliable Boston capitalists for the purchase for the same. A mining expert is shortly to arrive for examination of the property. It is said it is one of the finest ore-producing veins in the Province and will undoubtedly prove very rich if properly developed. If not sold within a reasonable time steps will be taken to form a local company for development of the same."

N.B. Courier - Sep. 27, 1851 We have been favored by the Directors of the Mechanics' Institute with the following Report, which we have much pleasure in publishing: Report on the Industrial Exhibition, Held at Saint John, On September 9th, (and following days,) 1851. To the New Brunswick Society for the Encouragement od Agriculture, Home Manufactures and Commerce throughout the Province. On the 11th of June last, W.J. Ritchie, M.P.P., the President of the St. John Mechanics Institute made application to the New Brunswick ... Class 1. Raw Materials: Sec. A. Minerals. The Exhibition was by no means complete in this department, although the Museum of the Institute, which was thrown open to the public, contains a great variety of the useful Minerals of the Province. We could wish to have seen at a glance, a series of the Provincial Rocks and Minerals of economic importance, and shall expect it at some future Exhibition. The Minerals exhibited on the present occasion were, many of them, of considerable interest. We may mention - A mass of native Black Lead, of which a large and valuable vein exists near Indian Town, and is now profitably mined by a Joint Stock Company. Samples of prepared Black Lead, exhibited by the St. John Black Lead Mining Company: this article seems well adapted to supply all the wants of our Provincial housekeepers. Asphatum or Asphaltic Coal, (for there is adoubt as to its true nature,) is a valuable Mineral, mined by a private Company in the Parish of Hillsborough, Albert County, and is already largely in demand for the manufacture of Gas. Soft bitumen, or Naptha, from the Petitcodiac, where it issues from the earth in a liquid form, and afterwards hardens by exposure to air. Asphaltic Shale, from Albert and Westmorland

Counties; this is an article, the use of which in making gas, waterproof cements, pavements, &c., is increasing every day. Mineral Paint (an earthy oxide of iron, orferruginous earth,) from Shediac; this substance occurs in various parts of the Province, and is yet destined to replace all the forms of ordinary paint as a covering for wood work, &c. exposed to risks by fire. This present sample was exhibited by the Messrs. Gilbert. Mineral Paint, (an earthy oxide of Manganese,) from Albert County; an article which may yet be brought into use. Black lead, we may observe, is considered to be a good kind of mineral, or fire-proof paint; and we would suggest to the St. John Black Lead Company, that they should make some experiments upon the subject. Alabaster, or White translucent Gypsum; this is another of the varied Mineral products of Albert County; we observe specimens of it now for the first time on public exhibition, with great satisfaction; there is a square block of it, a vase turned from it, by Mr. McCoach, and a head carved in alto-relievo, on the same material, by Mr. Foulis. Its admirable purity and general qualities are well seen in these specimens, but none of them exhibit the beautiful polish of which it is susceptible. There is also a magnificent group of Chrystals of Gypsum, from Kings County, but their economic value is small as compared with the massive form from Hillsborough. Lime. - There is a cask of beautiful white Limeexhibited. This is one of our staple productions, and the St. John Lime is unsurpassed for its purity and general fitness for the purposes of the builder. The Limestone contains less than two per cent. Of impurities.Salt, by Joe Brand, of Sussex Vale; this salt is of first rate quality for farmers' purposes, and we are much pleased to learn that its manufacture has been resumed at the springs, and that Mr. Brand is enabled to sell it as low as the imported salt.Honestones, from the Kennebeckasis; these seem to be of good quality, and work either with water or oil. They bite well, and will compete with the Honestones of Woodstock or Miramichi, which are now coming into repute. Lead Ore. - Of this there are samples from King'sand Charlotte Counties, and Iron Ore from one or two places; but no information is given as to the probable supply from the various localities. The samples of Iron and Steel, from Woodstock,seem to be of the very first quality; the Iron has been bent and twisted, when cold, in every direction, but without showing the least injury to the fibre. It would be hard to devise a more complete proof of the quality of the article. We understand that the manufacture of Woodstock Iron will now be carried on vigorously by a Sheffield firm, who have become aware of its admirable qualities and adaptation for the making of Steel. Pipe Clay. - This article is from Albert County, and is exhibited by Mr. Foulis. It has a very good color, and seems to be well adapted for the manufacture of Stoneware, &c. ..."

St. Croix Courier - Mar. 29, 1906 Prospects in Iron. - A Scientist Talks of Mineral Deposits in Charlotte County. - (St. John Times.) - The Times on Thursday last told of the unsuccessful experiments at the Sault, showing that magnetite could be profitably made into pig iron by utilizing electricity in the process of smelting. It is interesting to note that there are large deposits of magnetite in New Brunswick and its development, if the electrical process is really a success, would mean much for the province. Dr. George F. Matthew, discussing the subject with a Times representative this morning, said: 'There are several localities in New Brunswick where both magnetite and hematite can be found, At West Beach, for instance, there is good magnetite; and at Lepreaux explorations with a magnetic instrument seem to show the existence of extensive deposits. 'Hematite is known and has been worked nearWoodstock, and there are extensive deposits on theTetagouche River in Gloucester county. 'As regards the electrical smelting of Lepreau ore,' continued Dr. Matthew, 'there is an excellent water power on the New River, not far from the mine, from which power could be had for producing electricity. 'North of St. Stephen, near Moore's Mills, there are considerable veins of pyrrhotite, which being near the line of railway, might be available for the production of ferro-nickel pig under the new process.' Referring again to Lepreau, Dr. Matthew pointedout that there are large peat bogs in the vicinity of the magnetite deposit, and the surrounding country is more or less wooded."

Daily Telegraph - Oct. 5, 1864 and Miramichi Gleaner - Oct. 8, 1864 Provincial Exhibition. - Minerals, of which Prof. Hind and Mr. G.F. Matthew each exhibit a collection. The latter gentleman has also a collection of the useful, and of the combustible minerals of New Brunswick. Mr. James Davidson, of St. John, exhibits a collection of clays and sands, and of bricks and tiles. There are samples of copper and lead ore from Hon. Capt. Robinson, of Campo Bello, and of copper ore from the Vernon Mining and Smelting Company's mine at St. Martins. The salt of Kings County is represented by samples from Mr. J. Brand, of Sussex; the building stone of Queens by specimens from Mr. H. Walton; and the mineral paints of Westmorland by a collection from Mr. Chas. Barnes, of Sackville. Norris Best, Esq., of the Woodstock Charcoal Iron Works, has furnished pig iron and iron ore from Carleton County."

Codes: 0690 / 0691 / 0763 / E5 / IDX_Names: Glebe Manganese; Markhamville Manganese; Jordan Mountain Manganese; Sussex/ Plumwesweep Salt;
Daily Telegraph - Oct. 15, 1887 Soil and Mineral Wealth. - Abounds in the Heart of Kings County. - .... One of the most important industries is manganese mining. There are several places where this valuable mineral is found in almost inexhaustible quantities. The two mines that are most largely worked are about eight and ten miles from Sussex.Large quantities of the ore are daily brought out in waggons, that being the only means of access to the mines. It is stored in a large building near the station, from which it is shipped principally to Boston and New York, where it is used mostly in refining iron and steel. The ore is of an excellent quality and is in the side of a hill, from which it is easily removed. Of late this business has made rapid progress and there is every indication to show that it will continue to enlarge. Another very important industry is the manufacture of fine white salt for table and dairy use. The salt springs are about four miles from Sussex, and only half a mile of level land between them and the railway. The valuable quality contained in the water of this place was discovered many years ago, but the necessary capital and enterprise not being forthcoming scarcely anything was done properly developing it till about a year ago, when borings were made to the depth of about 125 feet, which the capital possessed by the projectors not being sufficient to warrant further expense in that direction the boring was discontinued. Pipes were put down the hole to convey the brine to the evaporating pans, and the manufacture of salt commenced on a small scale, and has been steadily continued ever since. It was found that the percentage of salt in the water had increased, but not sufficient to enable the operators to manufacture the salt as cheaply as the imported article, notwithstanding the abundance and cheapness of fuel for evaporating purposes. Upon analysis it was found to be so much purer than any other that could be obtained that it readily brought the increased price made necessary by the conditions under which it is manufactured. It was pronounced the purest in the world, and wherever it has been exhibited it has always carried off the first prize. The owners are confident that if the boring were continued to the proper depth the percentage of salt would increase proportionally, and if they were carried down to the salt bed it would be possible to manufacture the salt as cheaply as it can be made elsewhere where the wells are 1000 feet deep or more, and its greater purity would enable it to compete successfully with salt which is made in Ontario, the United States or England. The water at present rises about

15 feet above the ground, and it was found that the deeper it was bored the greater was the volume and force with which it flowed from the well; this saves the cost of pumping. Here therefore is a chance for capitalists. It has been computed that an expenditure of about $15,000 or $20,000 would put this industry in a position to compete with any other place in the world, but this large amount is not possessed by the owners. As this would be a source of a large revenue to the country it is to be hoped that it will shortly be taken hold of by some enterprising capitalists and the production of this indispensible article of consumption brought to its proper proportions. Jeune Ecrivain. Sussex, Oct. 14."

S.J. Daily Sun - Oct. 3, 1883 Exhibition. - Mineral Exhibit. - The Queen Mining Company, of Sussex, managed by Major Markham, furnishes amost interesting exhibit, in a small space, of manganese ores prepared for the use of consumers. The coarser or low grades are used principally in the manufacture of bessemer steel, the market for which is found in Europe; the higher grades are used in the manufacture of glass, varnishes, bleaching agents, etc., and are exported to the United States. Along with the finer ores may be seen the manganese in rocks, in which it occurs in pockets of lower carboniferous limestone, and specimens are also shown of iron ore and dog tooth spars, which sometimes occur with the manganese. Messrs. W.N. Gould and F.W. Stockton show a varied assortment of mineral ores from various districts in the Province. As these are not arranged with any degree of regularity, nor the localities given where they have been found, the display loses some of its value in consequence. Silver galena, copper, manganese and other ores are shown. Mr. Gould also has some specimens of Albertite coal, ground plaster, phosphate of lime, hydraulic limestone, gypsum, lithographic stone, asbestos and verdantique marble. The Natural History Society of New Brunswick display a fine collection of gold-bearing quartz and gold dust from the Waverley mines of Nova Scotia. The different coal companies of Nova Scotia furnish specimens of their products. Those represented at the Exhibition are the Joggins, Minudie, Acadia and Spring Hill mines, and all the different grades and qualities are shown.The different lime and brick kilns about St. Johnhave specimens of their productions on exhibition, andthe N.B. Granite Company make a handsome display both of grey and red granite. The New Brunswick Salt Springs Company showspecimens of fine and coarse salt, manufactured by them at their works, in Upham, King's County. The Lake George Antimony Mines are wellrepresented, not only by specimens of ores, but also by the different processes and materials used in the preparation of metallic antimony. The Lawrence Antimony Mine, of Queen's county, also exhibit specimens. Silver and copper ores are also shown by R.R.Call, Esq., of Newcastle, and copper ores by Dr.Goodfellow of Sussex. Very fine specimens of native copper ore, occurring in trap rock, near North Head, Grand Manan are exhibited. A map of Nova Scotia showing the occurrence of mineral ores in that Province, was sent by Dr. Gilpin of Halifax."

St. Andrews Standard - Jan. 12, 1870 From the Canada Year Book for 1870. NEW BRUNSWICK No mines of gold, silver, lead, tin, or other metals nor here under mentioned, are now being worked in New Brunswick. Iron is being raised and smelted to a limite dextent at Woodstock. There are no other iron mines worked, though available ores occur at other points. Copper - With the exception of a mine at Adam's Island, in Charlotte County, owned and worked by an English Company. ""The Casco Bay Mining Company"" - who still employ about thirty men, all the New Brunswick copper mines have been, for the present, abandoned. Manganese is being profitably worked at the ""Markhamville Manganese Mines"" in Upham, Kings County.Thirty men are employed, and the number is to be increased. In 1867-8, the trade returns show that New Brunswick exported 861 tons, valued at $19,019. Plumbago has been removed from two localities. From the first, at Portland, Saint John, 2,000 barrels, of 308 lbs each, have been taken. From the second at the Falls, Suspension Bridge, St. John, called ""The Split Rock Plumbago Mine"", - Mr. A. Garrit, director, - some twenty-five barrels a day are being taken out. Coal is now being mined in two localities only, the Albert Mine, near Hillsborough; and the mines at Newcastle Creek, Grand Lake. - It is doubtful whether the Albert coal is coal at all. Better to call it Albertine. Salt is being manufactured on a limited scale from brines near Sussex. The product might be much increased by judicious management. Lime is burned to a considerable extent at the narrows of the St. John, at the Green Point Quarries, &c.; on a limited scale at many other points. Plaster is quarried and calcined for exportation at Hillsborough. Almost all the above information has been furnished by Professor W. Bailey, of Fredericton."

Morning News - Oct. 2, 1861 Provincial Exhibition. - ... at Sussex Vale ... The Mineral Department was very complete; there were hundreds of specimens of all kinds of Minerals, unless silver be expected. A number of gentlemen in different parts of the Province sent extensive collections of Clays, Shales, Coals, and Ores of various descriptions; but as this is a very important feature in the Exhibition we intend to notice it more fully at an early day. At present, it is sufficient to say that nearly every portion of the Mineral Kingdom was represented. A noble block of Coal from the Albert MiningCompany, attracted great attention, and a keg of excellent butter salt from the Salt Spring in Sussex was much praised. There were samples of Grindstones and Building Stone from all parts of the Province, as well as Alum from the Chemical Works in

Codes: 0721 / Z3 / IDX_Names: Shepody Mountain Manganese; Guano;
S.J. Daily Sun - Nov. 10, 1891 Albert County. - A Visit to the Shepody Mountain Manganese Mine. - (Staff Correspondence of the Sun.) - Hopewell, Nov. 7 - .... Country lawyer .... C.A. Peck ... splendid farm ..... M.P.P. ..... From the hill, your correspondent was driven out by Mr. Peck to Mineral settlement, where a visit was paid to the manganese mine now being operated by Mr. Van Meter, amid the ruins of the long ago abandoned Steadman mine and chemical works. Mr. Van Meter's operations are being carried on in a ravine at the base of Shepody Mountain. A tunnel has been driven 800 feet into the hillside, 500 feet before ore was reached. A tram way with wooden rails, connects the tunnel with a dump a short distance from its mouth, whence the excavated earth is carried in a car hauled by a horse. Timber for the walls and roof of the excavation is obtained about a mile up on the hillside. Mr. Van Meter was up when the scribe visited the mine, but the workmen engaged there said he was pushing things along with a vigorous hand. Shepody Mountain in entire height is about one thousand feet and slopes to the bay gradually. According to Dr. Gesner the mountain is the highest land in this portion of the province. It is about ten miles in circumference at its base, is triangular in shape and is somewhat varied in the character of its component parts. Prof. Bailey, who visited the deserted Steadman mines in 1864, thus describes the geological formation of the mountain: According to information given me at Hopewell, the southwestern half of the mountain is composed of chloritic and talcose slates, the southeastern side at the same level is sandstone, while capping both and rising to the summit of the mountain, are coarse red conglomerates. One side of the ravine, where the adits are (the right hand looking down towards Hopewell) is composed, as I myself saw, of chloritic and talcose slates, with a little steatite, dipping about southeast. The bottom of the ravine is the point of junction between these rocks and those in the immediate vicinity of the adits. These rocks between the slates and the manganese are limestones (resembling mountain limestone) and are about three or four feet thick, forming a sort of foot wall, and with them is associated a little clay. The manganese occurs in veins and beds, some of the latter being from one to five feet in thickness. The course of the ravine and also of the lode is about N.E. and S.W., with a dip to the southeast. Prof. Bailey says that about 400 tons had then been removed and shipped to England and the United States, where it sold for about œ10 per ton. The ore is a compact black oxide, but apparently less pure, he thinks, than those of Bathurst and Upham. There were at one time extensive chemical works in operation at this place, in the immediate vicinity of and in connection with the manganese mines. The products of these works were alum, soda ash and chloride of lime. The alum was not made as is commonly the case, from decomposing pyritous shales, there being none of these in the vicinity, but from the clay beds found associated with the manganese. The distance from market, with the cost of transportation of the chemicals to and from the works was one fruitful cause of their failure. Some of the ladies of Hopewell still remember alum baskets presented to them by Mr. Steadman as samples of one of the products of his works. Some persons with whom the Sun correspondent talked on the subject, believe that it will be necessary to go down pretty deep in the earth to find valuable minerals in Albert in paying quantities. ...."

LIME / D7 / Springs Salt; Lime - General; Kings County Coal;
Daily Telegraph - Aug. 13, 1880 Kings County. - ..... Coal. - Some search has been made for coal, but hitherto with only partial success. Some loads of bituminous coal, closely resembling that of the Springhill mines, has been mined quite near the surface on the lowlands near Stone's Brook, at Dunsinane mills. Specimens of unmistakeableAlbertite were found some years ago in Mechanics' Settlement, and some land property changed hands at a good valuation in consequence, but the discovery was not further developed. More recently, Albertite has been discovered on the lands of Mr. George Teakles, at the head of South Branch, Cardwell, and a considerable effort has been made to test its value. Salt has been manufactured on a small scale for agreat many years beside the old Post Road, and midway between Penobsquis and Sussex. The manufacture is carried on by Mr. Mercer, the lessee of the property, by boiling in iron boilers, producing ten or twelve bushels a day, we are told. The excellent quality of this salt for dairy purposes is so well established that good butter makers in the vicinity will have no other, even though they may have to pay double the cost of other salt for it. Purchasers of butter in the city also not infrequently inquire as to what salt butter which they propose to purchase is preserved with, a preference being given, whether on real or imaginary grounds, for butter flavored with Sussex salt. Of several natural brine springs in the county only one other has yet been utilised. This is located at Salt Springs Settlement, Upham, some three or four miles distant from the St. Martins and Upham railway. The spring is a remarkably large one, and the salt produced a few years ago was apparently of equal excellence with the Sussex salt. The works are now out of repair and idle. There are here some remarkable indications that the salt deposit is not far from the surface, as in several places the earth has settled and fallen in, in some spots quite recently, which is believed to be occasioned by cavities underneath formed from the dissolution of the salt, which finds it way to the surface in the brine of the spring. It is not probable that the manufacture of salt will even be productive of large profit until a stronger brine or the rock salt itself is reached by boring as is done at Clinton, Seaforth and Goderich, Ontario. Salt is there very largely and profitably manufactured out of brine formed in the salt beds a thousand feet deep and pumped to the surface, boiled in immense boilers 120 feet long and 20 feet wide. There is good reason to believe that salt would be struck at half this depth at some points in Kings if borings were made and that the venture would prove a highly profitable one if undertaken. Plaster, etc. - Among other economical mineral products are plaster orgypsum, which is found in several sections of Kings and has proved an excellent fertilizer. Notwithstanding that it is native to Sussex there are still extensive importations of plaster chiefly from Petitcodiac. Lime stone crops out extensively in almost every section of Kings. Kilns for burning it are also quite numerous, including a large one on the farm of Mr. Wm. Pugsley atSussex. Lime is coming more and more into use as a fertilizer and with excellent results. Iron ore of excellent quality was reported yearsago as existing at Bullmoose Hill, in Springfield, and bog iron in several localities near Sussex, but as yet nothing has been done to develop their value."

Headquarters - Oct. 13, 1858 Sand. - Some difficulty is experienced here in obtaining sand for building purposes, and in consequence, extravagant prices are charged for it. There is excellent sand on the bank of the river, about four miles from the village, near Mr. Bull's, but he undertakes to charge 50 cts. for every load that is taken from the bank, and very

kindly offers to supply our citizens with the article at the exorbitant price of ten cents per bushel, wheat measure. At this rate, that sand bank is equal to California gold. We suppose the next that we shall hear will be that sand is selling in our streets at four pence per quart. If we could have some of that Hammonton sand here, it would be a fine thing. - Aroostook

S.J. Daily Telegraph - Sep. 27, 1872 Charlotte. - The white sand on the shores of Lake Utopia is likely to become an article of trade. A cargo of it is now being shipped to St. John for use in the Glass Works there."

S.J. Daily News - Aug. 17, 1877 Blasting Accident at Dorchester. - A sad accident, resulting from careless and ignorant tampering with blasting powder, occurred at Conner's Ballast pit, Dorchester, on the 13th inst. A blast had been placed in a large rock; the fuse was ignited and burned down to the powder; but, however, without resulting in the expected explosion. As soon as they were satisfied that the blast was not going to explode, two of the workmen proceeded to drill out the hole in which it was placed, one of them holding the drill while the other struck. No sooner had the first blow fallen, than what might have been expected occurred. A spark from the drill exploded the powder, and in a few moments the sixty pitmen were gathered around the torn and mangled bodies of their unfortunate comrades. When taken up the bodies of the insensible men presented a truly horrible appearance, being denuded of their clothing, and covered with a conglomerate mass of powder, sand, blood, and flesh. Medical attendance was secured in a short time and their wounds dressed. One of them, Michael Brown, a stranger of French extraction from the Upper Provinces, will probably pay for his carelessness with his life. The other, Dominique LeBlanc, a native of this place, will escape with a finely powdered complexion, and a number of scars. It is to be hoped that this sad occurrence may prove a remedy for the unaccountable carelessness that characterizes many such dangerous operations of this... [NOTE: rest cut off on original]"

Codes: AGGR / IDX_Names: Sand, Gravel;
Daily Telegraph - Jul. 21, 1879 Thoughts In a Gravel Pit. - The city of St. John, in their territorial domain of the Lancaster Lands, near Col. Goddard's Mill, own an immense gravel pit. It is of gigantic proportions that it would be difficult to exhaust it by meeting the reasonable requirements of a century. It would require a geologist to spend a good deal of time upon it to write the history of its formation and that of the picturesque region in which it stands. The Portland Council being engaged in the reconstruction of the suspension bridge road, some members of that body, in conjunction with M.P.P.'s of the City and County of St. John, applied to the Mayor of St. John for permission to take some gravel from the inexhaustible Lancaster pit to help to make good the road in question, which is one of the main thoroughfares to the Lancaster lands. The Mayor said a few loads might be taken to help to pack the broken stone, which was being put on the road near the bridge, and which, in the absence of such covering, was not very agreeable to the owners of carriages and vehicles who had to pass over it. The permission was over it. The permission was acted on, but soon afterwards the Mayor and some officers of the Corporation appeared on the scene at the great gravel pit. As they went out to it, they saw a considerable number of teams hauling gravel from the pit. When they got the length of the pit they thought there seemed to have been considerable activity in that quarter, the Mayor even estimating the number of loads taken under the supervision of the Portland road-making Councillors as high as a hundred! We believe that the accuracy of the statement is questioned, but whether the number was less or more does not yet appear by any official record. The Mayor, thinking that the few loads which he had thought might be taken had certainly been obtained, ordered the hauling to cease, but the teamsters, being under the orders of the Portland Councillors and paid by them, did not adequately appreciate the jursidiction of Chief Magistrate of St. John, and had to get orders from the Portland Councillors. As the city property, including the Lancaster Lands, is pledged to bondholders, and as all the gravels deposited in the great gravel pit myriads of ages ago, is held for the same purpose, and forms part of the security that St. John will not consent to be run down by friend or foe and declared a bankrupt city, the Mayor has made the Portland councillors aware that nothing less than the express permission of the Common Council will avail to enable the Portland Councillors to take a few more loads of gravel from the Lancaster pit, and the Portland Council are, we believe, likely to make the application necessary and we feel interested in the result and would suggest one or two points. The Douglas road has for years been in a bad state. Even the repairs and restoration it has received have not been very effectual in improving its quality. It is now being made in a thorough manner, commencing at the Suspension Bridge, and when finished it will be one of the best roads in the country and likely to last, with slight repairs, ten or fifteen years. The road has been levelled, the turnpiking and draining made complete, a heavy coat of broken stone put on, and all that is now wanted is the gravel, which is not easily obtained of the proper quality except at the Lancaster gravel pit. The people of the City as well as of Portland are interested in having a good road through Portland. Not only the citizens but our many visitors, who come from sweltering Western and Southern regions, to this mild and bracing region, are interested in having a good road leading to the Suspension Bridge. That point forms one of the sights of the city, and when the bridge is crossed, the traveller strikes one of the smoothest, hardest and best gravelled roads in the province. All hon or to the Lancaster Highway road, which never turns its back even on the great road when it needs repairs. The city, then, which invites visitors, should do all that it can without injury to itself to secure good roads through Portland. As already hinted, the gravel pit in question could meet any reasonable demands of Lancaster, Portland or St. John for gravel for hundreds of years. No buildings can be erected fronting to either of the two roads by which the pit is in part bounded, until the gravel is removed, and sites cleared. This fact should weigh with the city authorities. We say nothing of the fact that Portland and St. John expect some day to be one, and the existence of this gravel pit should make Portland anxious for union, but when the members of the corporation of Saint John consider the extent of the supply and the necessity of having a good road leading to the suspension bridge, we do hope that they will

make favorable terms with Portland, and permit its zealous Councillors to take a few more loads of gravel. When the permission is given, there is no reason why a metre should be put on the gravel hauled away. It is not like the gas which the President and Directors of the Gas Company disposed of in that way. It is almost inexhaustible; it is worth much and costs little, except the expense of hauling, and that the Portland Councillors will pay. Upon the whole, in concluding our thoughts in a gravel pit, we look for a favorable issue of this great contention, and one that will promote the improvement
Moncton Daily Times - Sep. 11, 1879 The Gravel for Main Street. - Mr. Dernier, whose contract was accepted by the Town, for the placing of 300 tons of gravel om Main Street, brought his first scow load from the gravel beds at Dover, yesterday. The gravel contained considerable quantities of earth, and the Councillors were not altogether satisfied with its quality. The parties who brought the gravel say that only a few tons at first would contain so much earth, as the frost had brought the earth on top of the gravel beds. We notice that some of the gravel has been placed on Main Street."
Moncton Daily Times - Sep. 30, 1879 Gravel on Main Street. - Mr. Dernier, who has a contract from the town for supplying 300 tons of gravel and placing it on Main Street, has about completed his contract. The last scow load was expected to come up river this morning. The gravel seems to be making a very satisfactory street, and the total cost is under $120 fro the gravelling of about 300 yards of street. - It will be noticed by the report of the Council meeting in another column that the Council is to open negotiations for another 300 tons from the same parties."

S.J. Daily Telegraph - Feb. 5, 1881 The Rock Cutting Case. - The case of the Town of Portland vs. John McGourty was continued before Police Magistrate Tapley yesterday afternoon. Mr. John McGourty,the defendant, was permitted to take the stand, and he stated in effect that he was granted permission to remove and quarry rock, by Councillors Thurgar and McLean, but not by Councillor Doherty. A this stage of the proceedings an adjournment was made until next week. In the meantime the boundary line dividing the Frost property from that of the town, upon which the trespass is alleged to have been committed, will be ascertained."

S.J. Daily Sun - Jun. 29, 1881 Moosehorn ballast pit....."

Kings County Record - May 3, 1907 The Sussex Gravel Company will commence operations as soon as the freshet is over. It is the intention of the company to use the siding at the camp ground for loading and a crossing will be put in near the wharf. The company expects to do a rushing business this season."

Kings County Record - Aug. 7, 1914 A large amount of gravel has been taken from the Dunsinane gravel pits during the past few weeks. The large cars are now used and about forty cars is the daily output. The old No. 2 steam shovel is being used and to show that they last some, it may be stated that the same shovel which was used in what was known as the Stone gravel pit, t Penobsquis, some thirty years ago is still in use. The house that Alfred Dunfield & Son lived in, previous to removing it to South Branch, that stood near the pit has been torn down, and the ground on which it stood will

Kings County Record - Aug. 29, 1919 Much Gravel Being Shipped from Sussex. - Big Steam Shovel has been working here for several months - Hundreds of cars have been loaded and sent to Moncton. - An industry, if it can be so called, in Sussex that is at the present time and has been for the past few months doing a thriving trade, is the gravel industry. Few people, even residents of the town, have any idea of the immense quantity of gravel that has been shipped away from here this season or of the amount of money that has been paid out in wages and for teams engaged in hauling it from the beach to the railway siding at the Military grounds, where most of it has been loaded on the cars. A large steam shovel has for months been in operation on the beach near Riverside Park and this powerful engine of labor has scooped thousands upon thousands of yards of gravel from the banks and the bed of the river, most of which has been shipped to the city of Moncton. Fuller & Co. of Montreal, who have the contract for the erection of the big building now under construction at Moncton for the T. Eaton Co., of Toronto, have taken the largest amount of gravel and the Warren Paving Company, of Moncton, are also quite heavy shippers, as they use the Sussex gravel in the street and cement work carried on in that city. In the last three months many hundreds of cars have been shipped from here and at the present time the Fuller Co. are shipping from eight to ten cars daily and the Warren Paving Company three to four. The beach gravel owners are making good money out of a commodity, which, if luck is with them, will be replenished largely in the spring by the first big freshet. Over five hundred cars has been loaded from one beach and as the price paid is in the vicinity of six dollars a car, it can readily be seen that the season has been a prosperous one for the beach owners. Many teams have been engaged all summer hauling gravel, being paid at the rate of seven dollars a day. The shovellers have not been as numerous as might be supposed on account of the largest part of this class of work being done by the steam shovel. As a result of the work done by the steam shovel good bathing facilities are now afforded and all that is necessary to make the same available for use by all who desire to do so is the erection of a couple of bathing houses. Many large areas have been scooped out to a depth of eight to ten feet and now make dandy swimming holes, but just a bit dangerous for the small boys and girls, and all who are unable to swim. If the town would provide bathing houses Riverside Park and the adjacent beach would become a much more popular resort. The removal of such an immense quantity of gravel has completely changed the course of the river which is now much wider and deeper than formerly."

Moncton Daily Transcript, Page 7 - Tuesday, May 20, 1919 Albert County Happenings - A new steam shovel is being set up at the gravel pit at Albert. Gravel is being got, it is understood for the big Eaton building in Moncton."

Kings County Record - Nov. 28, 1919 The last lot of gravel to be sent from here to Moncton this season was shipped on Wednesday. During the past few months in the vicinity of nine hundred cars has been shipped. The gravel industry has brought considerable money into Sussex and furnished much employment."

Kings County Record - Sep. 19, 1935 Sussex Gravel Beds Praised - Said to be Best in Canada. - Best Gravel for Concrete, Bituminous or Cement Purposes Contractors Say. - 100,000 Tons Shipped. - Local Workmen Highly Commended as Mechanics by Superintendents. - 'The best gravel I have ever seen for cement, bituminous or concrete purposes,' was stated by Mr. J.W. Gillis, superintendent for the Warren Bituminous Paving Co. Ltd., of Toronto, regarding the gravel shipped from Trout Creek to their paving projects at Model farm and Sackville which opinion was strongly endorsed by Mr. John Watts, of Toronto, superintendent of the Rayner Construction Co. Ltd., of Toronto, who have about completed contracts, east and west of Moncton from Penobsquis to Sussex and in Sussex town, and by Mr. W.J. Hawkins, representing the Storms Construction Co., Ltd., who have a paving contract between Memramcook and Dorchester. If this gravel was located within 40 miles of Toronto, he would prefer it to a gold mine. Mr. Gillis remarked. The gravel in Ontario was about 45 per cent sand and 55 per cent gravel, whereas that in Trout Creek was only 20 per cent sand and 80 per cent clean, well washed gravel. The amount of gravel shipped from Sussex by these three firms this year is over 100,000 tons, which if made up in one train would extend 15 miles. The Rayner Construction Co. - The Rayner Construction Co., Ltd., ... have already shipped about 35,000 tons of gravel from the beach owned by W.H. Holman and will use about 4,000 tons on the Sussex project of which 4,100 feet has already been laid and which will be completed next week. ... The Warren Co. ... had shipped about 700 cars containing 42,000 tons, about 60 going to Model Farm for the Hampton-Rothesay project of 13 miles, and 40 per cent to Sackville ... The Storms Co. ... has shipped about 300 cars containing about 18,000 tons of gravel from the George Wallace gravel beach ... The company has moved its gravel digging plant to College Bridge ... to try out a new gravel pit on the side of the road ..."

Daily Telegraph - Feb. 11, 1881 The Portland Rock Cutting Case. - Mr. McGourty Heard From. - Sir: On Saturday, 29th of January, the Town of Portland commenced a private prosecution against the subscriber for quarrying stone off private property in the vicinity of Zion's church. Mr. Editor, I think the facts of the case may interest property owners and rate-payers of the Town of Portland and particularly of Ward Four. About the 20th of January I made arrangements with Mrs. Frost to cut some rock on her property, next Zion's Church, in Ward Four. It was necessary in carrying on my blasting openly to get permission to use the street. I got the usual verbal permission from two councillors and I will state, without fear of contradiction, that in six years that I have been working in Portland, on many of their streets, excavating, I never was asked for a written permit from a councillor, and did not know that it was necessary; but in this case a musty bye-law was unearthed, and I am hounded down by a councillor and rival contractor; one of them has brought me before a magistrate, and the other goes to Mrs. Frost and offers that lady $50 to break the bargain she had already made with me in reference to the cutting. Mrs. Frost could not be bought; and, of course, when they could not succeed, after stating that I could and would get permission from the town to improve the property in question, the case was taken to the public police court, where, of course, I was fined. Comment on the whole thing is unnecessary. However, if the intelligent representatives of the town stand that sort of business, I don't wonder at their having several lawsuits on hand. Of course we have appealed the matter. I remain, Sir, Yours, etc. John McGourty. St. John, Feb. 10, 1880."

N.B. Reporter - Nov. 11, 1896 Stone for the Streets. - Having decided to purchase a road making plant and stone crusher, a number of the City Council accompanied by Prof. Bailey and Roadmaster McKay drove up to Currie's Mountain on Saturday afternoon last, to ascertain if the stone there, which had been referred to at the Council meetings, wassuitable for road purposes. A report has been drawn up by Prof. Bailey going very minutely into the kinds of stone necessary for road making, and referring as follows to that at Currie's Mountain: Of the road-building materials to be obtained near Fredericton, the first to be here noticed is that which has so long been used, viz., the grey sandstone and grits of the coal measures. Though abundant in quantity, and obtainable at moderate cost, experience has abundantly demonstrated their unculability. Though composed of hard material, the rock is brittle and its cohesion small. If used at all, its cementing power would probably be somewhat augmented by the admixture of a small amount of lime and limestone rock. Secondly: a possible source of the road bed supply is that of the hard slates and sandstone or quartzes which border the St. John river on its western side from near Spring Hill, northward, and on the Keswick ridge. Apart from their remoteness, these rocks are not to be recommended, and for the same reason as before; they are both brittle and destitute of binding power. A third material available for roadmaking, is river gravel, and it may be obtained, and cheaply obtained, at the head of many of the islands in the St. John river. There are many who speak highly of the roads made of such gravel, but says

Prof. Slater, the experience which has been gained in Massachusetts, is to the effect that, save under rarely occurring conditions, the use of gravel in the construction of roads, is not to be recommended, and this for the reason that the rate of wear of the material is in general so rapid, that the cost of repairs, when capitalized, make highways of this description more expensive than are those which are constructed of macadam. The last material to be noticed is also the best. This is the trap or volcanic rock of Currie's Mountain. This rock, if not identical with essentially the same as that which under the name of diabase, is found in many parts of New England and which is there extensively used for road making. Prof. Slater of Harvard, says of such rocks, Their fitness for road building has been very extremely tested and amply proved. Again he says, The ordinary dyke stones (diabases, etc.) of eastern Massachusetts are abundant and generally of an excellent quality. It is to be noted that these dykes appear to be much decayed on or near the surface. Rarely, however, does this decay extend to a considerable depth, so as to limit the value of the stone for road use. The relative power of wear of these rocks was found by careful testing, to vary from 15 as compared with granite 10 to 13, carboniferous grit 10, essentially the same as our sandstone, slate 8 1/2, limestone and marble 2 to 6."

Codes: E5 / IDX_Names: Sussex/ Plumwesweep Salt;
Daily Telegraph - Oct. 10, 1865 (For the Morning Telegraph). - Scenery, Traditions, and Reminiscences of King's County. - Sussex, Sept. 25 th. - Dear Editor:- ... 5 ... The Salt Springs. - ... road leading to Smith's Creek. A short distance beyond this are the Sussex Salt springs, famous for the excellent quality of the salt they produce. The situation is a good one - only about a mile from the nearest railway station. The Springs - of which there are several - throw out a large quantity of water, and all it requires is proper management on a large scale to become extremely lucrative. The present works are old and dilapidated, and the man who works them boils only about a month a year, tending his farm the rest of the time, while the salt produced is greedily bought up by the people of the neighborhood, although always held at a price much higher than imported salt. Some day some enterprising Yankee will come along and astonish the people by taking hold of these Springs and making a fortune out of them, while our own people will stand idly by, or in disgust set out for some foreign land to make that fortune which Providence has already placed within their easy reach in the way of vast natural resources and wealth of this our land, but which they treat with the utmost indifference. ..."

S.J. Daily News - Apr. 11, 1866 The Salt Works at Sussex, of which Mr. John W. Perry, Charlotte Street, is an Agent, are supplying the market with an excellent article of salt. A sample which has reached us proves that the article will compare favorably with any foreign production. The public can satisfy themselves more fully on this head by a visit to Mr.

Morning Journal - Mar. 21, 1866 New Brunswick Salt Works. The proprietors of the above works, having increased their facilities for manufacturing are prepared to furnish the trade a better article, at a less price than can be imported from the States. The superiority of this Salt over all others is too well known to need comment, it being entirely free from lime or other deleterious substances, which are known to prevail so largely in improved salt. Until the Storing apparatus is completed, (which is now in course of erection), preparatory to putting it in sacks, this salt will be put up in barrels, containing four (4) bushels. Salt Depot, 7 Charlotte Street, Jno. W. Perry, Mar 14 Agent"

Daily Morning Telegraph - Jan. 15, 1867 The Sussex Salt Manufactory. - These works are situated beside the old post road, some four and a half miles east of Sussex Station. We understand that for thirty years salt has been made here in small quantities; but, owing to the want of sufficient capital, or from some other cause, the works were not put in an efficient state, and were allowed to lie idle during a considerable portion of the time. In 1866 the present works were constructed, but had not been long in successful operation when the large building, under cover of which boiling operations were conducted, was burned to the ground. It is said that this fire was the work of an incendiary. The most valuable part of the works - the Furnaces, Boilers, &c. - remained comparatively uninjured; although in many respects the loss to the enterprising proprietors was a heavy one. When in full operation, before the disaster just referred to, the works were found to be of sufficient capacity to produce from 150 to 200 bushels of the very best salt per week. A brief description of the works, as they are, may not be uninteresting to our readers. The soil upon which the furnaces were built being a soft intervale, it was necessary that excavations should be made in order that a firm foundation should be laid; this was done at a cost of considerable labour and expense. On the foundation thus carefully prepared the furnaces were built in the form of a cross, each of the transverse sections being thirty-five to forty feet in length, by about fifteen in width. In each of the four ""wings"" thus formed are two parallel furnaces, with iron doors; these furnaces all communicate with the large chimney which rises in the centre. Above these furnaces the Boilers are situated, five in each wing, one with flat bottom the dimensions of which are some five by twelve feet, situated at the outer extremity of the works; immediately within this are four smaller boilers, two abreast, circular in shape, and some five feet each in diameter. In the centre are two Pans or Boilers much larger than any of the others, situated one on each side of the chimney. These with those before enumerated, make twenty-two in all. Since the fire above alluded to, two of the wings have been covered with temporary sheds, under which boiling is carried on a part of the time. As the procuring and preparation of fuel forms a principal part of the expense of an establishment conducted as this has been, the question has arisen whether, by the construction of much larger pans or vats, the work of evaporation might not be effectually carried on by the natural heat of the sun, on a much larger scale and at the same time more economically. As our summers compare with those of the south of France in temperature, and as the above mentioned plan is largely practiced there as well as in other parts of the world, we incline to the opinion that it might be adopted here with profit. There can be little doubt also that if borings were made to sufficient depth in this locality, brine of the greatest strength would be found in sufficient quantity to supply a manufactory of the largest capacity. The salt hitherto made here has a deservedly high reputation as a Butter Salt; indeed it is very probable that to the use of it the Dairies of King's County are much indebted for the peculiar excellence of their butter, no other salt being used when this can be procured. The manufacture of salt has been found to be a valuable field for private enterprise, as well as a lucrative source of revenue to the Government, in many countries. In the State of New York the celebrated Onondaga Springs have, within the last few years, attained an astonishing development. In 1861 the number of bushels of Salt produced by these Springs was 7,200,391, while the duties collected by the State amounted to $72,003, although only one cent per bushel! The dividends paid to the shareholders in this enterprise reached 20 per cent per annum. Two years after the commencement of operations by the Salt Works Company of Saginaw, Mich., the increase in the value of property in that and an adjoining County was at least $3,000,000, while in the immediate vicinity of the works it had increased in value 2,000 per cent. We refer to these facts in order to show that, beyond a doubt, with the application of sufficient capital and energetic management, the Salt Works of Sussex may be made the source of incalculable advantage to the people of King's and the Province at large. While our Province is importing from twenty to thirty thousand dollars worth of salt annually, Canada also imports much of her salt via the St. Lawrence from Great Britain. With these markets to supply, and with full and free access to the markets of the world through the Railway and the port of St. John, we can imagine no reason why these works should not be conducted on a larger scale than at present, and be the source

Codes: E5 / IDX_Names: Sussex/ Plumwesweep Salt;
S.J. Daily Telegraph - Dec. 2, 1875 Sussex Salt Works. - Mr. Mercer, lessee of the Sussex salt works, which are now in operation, has closed contracts for several hundred cords of wood for next season's consumption. It is a pity that sufficient capital has not been provided for the developing of these works to an extent commensurate with the requirements of the country."

S.J. Globe - Jan. 14, 1881 and Daily News - Jan. 15, 1881 The N.B. Salt Springs Company. - D.M. Parker, Hon. G.W. Washington Warren, Jos. W. Warren, and C.E. Dearborn, of Boston, and Charles N. Skinner, Henry R. Ranney, G.R. Pugsley, Arthur T. Trueman, of Saint John, and W. Pugsley, jr., of Rothesay, have filed in the Office of the Provincial Secretary a Memorandum of Association for the incorporation of a Company to be styled The New Brunswick Salt Springs Company. The object of the company is the manufacture of salt by artificial and solar evaporation of brine from salt springs; also the mining of rock salt. The capital is $125,000, to be divided into twelve hundred and fifty shares of one hundred dollars each. The principal place of business is to be at the Parish of Upham, Kings, near which place the springs

S.J. Daily Sun - Jun. 1, 1886 Sussex. - White & Hallett, who are making vast improvements at the Sussex Salt Works have recently imported four 150 gallon salt kettles and other machinery for their works. They now have practical borers who are sinking shafts to great distance, resulting in obtaining water of a better quality. Their excellent salt is in great

S.J. Daily Sun - Mar. 9, 1886 Sussex. - An Important Industry - The Salt Works. - (Special Correspondence of the Sun). - Sussex, March 8. - Messrs. Allan Hallett and Simeon White have leased the Sussex salt works, and propose to go quite extensively into the manufacture of salt. They have contracted for large quantities of fuel, and will probably employ steam in connection with the works. Mr. White has paid a visit to the salt works at Syracuse, N.Y., and there learned much that will be of advantage in the prosecution of the new enterprise. He states that in the above mentioned works tubes have been sunk for a distance of 1200 feet, by which means a liquid is obtained containing 90 per cent. of salt. At the surface the water does not contain a larger percentage of salt than that at Sussex (about 20 per cent.); and he is of the opinion that by sinking wells here a larger percentage may likewise be obtained. As after the lower depths are reached the cost of production will be no greater, the profits will be proportionate to that increased percentage. The Sussex salt is of a finer quality when obtained than that of Syracuse or of Seaforth, Ont. - the two last mentioned being very similar in character. It is gratifying when home capital finds investment in that which is for the general as well as the individual welfares. Where capital is wedded to energy and enterprise, a community reaps the benefit. Your correspondent trusts that the venture of Messrs. Hallet and White may prove in every way successful."

Fredericton Capital - Mar. 11, 1886 Sussex Salt Mines. - Messrs. Allan Hallett and Simeon White have leased the Sussex salt works, and propose to go quite extensively into the manufacture of salt. They have contracted for large quantities of fuel, and will probably employ steam in connection with the works. The Sussex salt is of finer quality when obtained than that of Syracuse or of Seaforth, Ont."

S.J. Daily Sun - Apr. 3, 1894 Kings County Salt. - For many years salt has been manufactured at the springs a few miles above Sussex. The salt is, and in fact has always been superior in quality. No better can be procured in any market, but for a number of years these works have been partially inactive. This it seems was due to the high price asked for the salt. Geo. Hendricks, one of the owners of the works, was in the city yesterday. When questioned by a Sun man in reference to matters connected with the sale and manufacture of the salt, he said they were unable to place their salt in the market at a price equal to that asked by others, simply because the water was not as salty as that used by others, and as a consequence it required more boiling and more wood had to be supplied, which represented money. They have not been manufacturing every year for some time. They generally manufacture enough in one year to supply all the demand for two years. Their furnaces consume one and a half cords of wood a day and a fraction over three barrels of salt is the product of the day's work. Mr. Hendricks says that if they were to bore a few hundred feet deeper they would strike water which would yield a greater per cent. of salt than that now being used. The works will not be in operation this summer. They have over one hundred barrels of salt on hand."

St. John Star - Nov. 13, 1901 Surveyor General Dunn, accompanied by Mr. Goodrich, a geologist, and Mr. Fleby, an expert in testing properties by the boring process, spent yesterday afternoon inspecting the salt works near Sussex owned by Hendricks Bros."

Codes: E5 / IDX_Names: Sussex/ Plumwesweep Salt;
S.J. Star - Apr. 16, 1902 Salt Works Sold. - Hendrick Bros., of Cardwell, Kings Co., have sold their farm and salt works to a syndicate composed of English capitalists. The amount paid is $13,000. It is understood that among the capitalists interested are Wm. Wallace and Mr. Harney, of London. These gentlemen were connected with the late C.A. Stockton, some two years ago, in an effort to acquire and develop the salt industry near Sussex. The provincial government has agreed to grant the concern an exemption from royalty dues upon their product for ten years in order to develop the industry. Mr. Wallace, some three weeks ago, asked the city council if it would grant a subsidy to a company engaged to ship large quantities of salt and lithia product from St. John."

Weekly Record - Apr. 18, 1902 Salt Works Sold. - Messrs. Hendricks, of Plumwesweep, Sell Their Salt Springs and Farm to English Capitalists. - Messrs. Hendricks Bros., of Plumwesweep, have sold their well known salt springs and farm to an English syndicate. The amount of the purchase price while not definitely known, is believed to be in the vicinity of $10,000. Messrs. Hendricks, through their agent in London, a Mr. Walker, have been negotiating for the sale of their property for some years, but it has only been recently that matters have assumed definite shape. Mr. William Harvey, of London, England, representing English capital, is the purchaser, and through his representative, Mr. J.D. Buchanan, examined the property recently. Mr Buchanan is expected here again in a few days to finally close the bargain and take over the property. That the gentlemen who have made the purchase mean business is evidenced by the fact that they have secured from the local Government exemption from royalty fees for ten years, and have been negotiating with the I.C.R. authorities for the putting in of a siding at Plumwesweep Station, the idea being to pump the water from the present location to a point near the railway. Their intention is to manufacture a high grade of dairy salt for which the spring has in the past seemed particularly suited. A Record representative was recently shown a diploma for excellence received by Messrs. Hendricks for the Sussex salt shown at the Glasgow exhibition, 1901, and a similar diploma was received for their salt at the World's Fair in Chicago. Locally Sussex salt has been used for many years and is said to possess qualities as a butter salt which make it better than any on the market. With improved methods of manufacture Sussex salt should have a wide sale. Besides salt the company will manufacture soda and other products."

Weekly Record - Fri., Jul. 11, 1902 We learn from Mr. Geo. Hendricks that the parties who purchased the Salt Works and farm from them are hard at work organizing their company in London, and will probably at an early day be on the ground to take the necessary steps for the development of the property. When in motion it bids fair to be one of the important industries of Kings County."

Weekly Record - Fri., Mar. 6, 1903 A representative of the London syndicate who lately purchased the Hendricks Salt works, was in Sussex recently looking over the ground and sizing up the situation. It is understood that the erection of buildings etc. will be proceeded with in the near future and steps taken to commence manufacturing the various products in connection with the Salt Springs, and possibly other works may also be taken in hand."

Kings County Record - Feb. 15, 1907 Maritime Salt Works. - At the most it will be only a matter of a few weeks when the Salt Works at Plumwesweep, Kings Co. will be in operation. The Messrs. Buchanan are getting everything in shape to make an early start in the completion of the works, which was delayed owing to cold weather, and difficulty in obtaining material last summer. If fuel is any criterion of the amount of salt to be made, the Maritime provinces will be well stocked by this time next year. Mr. A. H. Buchanan, who lately arrived from the West is an expert mechanical engineer, and is here to assist in putting in the furnaces and evaporators which will practically utilize all the available heat. By the new method employed by Messrs. Buchanan the old pan and boiler methods will be entirely discarded, and salt made at one-tenth the cost. The floor of the present factory is laid with cement, and the tanks for the converting of brine into salt are capable of holding 20,000 gallons, against which will be presented over 800 feet of heating surface. The spring from which the brine will be taken will have sufficient overflow to fill tanks in the space of a few hours. As everyone knows, this salt is noted for its superior keeping and Dairy qualities, and has always won highest awards wherever shown. We understand a number of men will be needed for operating the plant, and we are pleased indeed to see the revival of another industry in our midst."

Codes: E5 / IDX_Names: Sussex/ Plumwesweep Salt;
Kings County Record - Jan. 3, 1908 New Brunswick Canadian Salt. - Large Company Organized to Manufacture Salt at Plumwesweep. - Concern is Making Good Progress. - The history of the salt springs at Plumwesweep is rather an interesting one. The old Hendrick's property has been for years the scene of more or less activity in the making of marketable salt. The series of valleys running from Havelock to Salina abound in salt springs with brines of varying density. Some of these have been exploited from time to time but most attention seems to have been devoted to the Plumwesweep springs. Salt of an excellent quality has been made from them. Some time ago the springs, together with some 1400 acres of land, were purchased from the owners by English capitalists, who intend placing the industry on a more firm footing. Several years ago, Mr. H.D. Buchanan came here in the interests of the owners, and during the past year, considerable money has been expended in erecting tanks and boilers. The new plant consists of two large concrete vats into which the spring water will be introduced in order to impart to the brine sufficient strength before boiling. The boilers are situated in front of the vats and the flames from the fuel used to boil the brine will be carried through sheet iron pipes passing throughout the length of the vats. In this way practically every particle of heat will be utilized, and the expense for fuel reduced to a minimum. The plans of the company, which is known as The New Brunswick Canadian Salt Co. Ltd., call for the installation of some thirty of these vats and boilers. The capital stock of the concern is œ50,000. During the past summer, Dr. R.W. Ells of the Geological Survey, examined the property and was impressed with its possibilities. If a secondary deposit of salt can be located, there is no doubt that the company has a good proposition. In order to determine the nature of the salt deposit, it will be necessary to make extensive borings and it is understood that tests will be made in the near future. One of the directors of the concern, Mr. A.W. McMullin contemplates visiting the scene of the operations early this year. He will look over the property and much will depend upon the nature of the report he sends home. The directors of the company are R. D'Oyly Nobles, Besveil John Mills; and W.A. McMullin, all of England. The Bank of British North America looks after the financial interests of the concern. The Canadian solicitor is W.H. Trueman, St. John. Harold D. Buchanan is the local manager. It may be said that the salt at Plumwesweep springs has always borne a high reputation among consumers. Although its manufacture has been conducted in the crudest possible way, the financial results were not altogether discouraging. As the Maritime Provinces afford the finest market for salt on this side of the Atlantic, the discovery of any considerable deposits would mean the building up an enterprise which would mean much to this part of the Dominion."

Kings County Record - Aug. 2, 1912 Will Bore For Salt. - English Engineer is Here with Crew and Will Try Salt Location at Plumwesweep. - Andrew Blair Aiken, a salt expert and mining engineer, is here from England in the interests of a Company formed to develop the Plumwesweep salt deposits. The works have been in the hands of different owners during the past couple of decades, and while salt of a superior grade has been obtained by boring down the spring water, the saturation was so slow that the industry proved unprofitable. One company after another gave up the task of trying to make the property pay but the present owners are using more modern methods in their development of the property. Mr. Aitken has with him a staff of good men and has started in to locate the salt beds over which the springs flow and from which they take up the brine. This practice was advocated by A.A Hayward, formerly president of the Nova Scotia Mining Society, who came here a few years ago to examine the springs. The idea is to handle the salt works on the same principle as that employed at the big Windsor salt plant in Ontario. There the brine is piped from the beds after the water is so thoroughly saturated with about 90 per cent of salt. In this way the cost of production is reduced to a minimum. The English company now engaged in the work will conduct boring operations at selected points and will endeavor to fix the salt beds. Work has already been started although Mr. Aiken only arrived from the Old Country last week. A boring outfit is now on the ground, and the work will be pushed forward as rapidly as possible."

Kings County Record - Aug. 23, 1912 Good progress is being made at Plumwesweep in the salt boring operations there. The drill is down nearly 100 feet and the water drawn from the hole shows a tendency to a more dense brine than that taken from the spring near the old works. The party now engaged on the work will go down some 250 feet or perhaps

S.J. Standard - Oct. 11, 1912 Salt in Kings County. - (Sussex Record). - The boring for salt has been abandoned at the Plumwesweep site. Those behind the movement are disgusted and are saying some pretty sharp things in connection with the transaction. The present owners allege that the property was bought as a workable salt proposition. Several English concerns have been interested in the business at different times. At first it was proposed to sink a shaft but later boring was attempted and after going down 218 feet, it was discovered that the brine was losing its density and the project was abandoned. That salt is located in large quantities somewhere in the valleys between Havelock and Salt Springs, in the parish of Upham, is generally admitted by experts who have been over the ground, but the location of the beds has yet to

Kings County Record - Oct. 31, 1912 Work has been resumed at the Salt Works, about a dozen men being employed. Thomas Kent of St. George has his boring machine on the ground and a hole is being sunk. The boring will be continued to a much greater depth unless a satisfactory brine is encountered, and the necessity of going down deeper avoided."

Kings County Record - Sep. 6, 1912 The boring operations at the salt works are progressing favorably. Since the accident of a few days ago, little difficulty has been encountered in operating the drill, which is now down 182 feet. The brine is gradually becoming more dense and this is taken to indicate the presence of salt beds within striking distance."

Codes: E5 / IDX_Names: Sussex/ Plumwesweep Salt;
Kings County Record - Sep. 19, 1912 and S.J. Standard - Sep. 11, 1912 The borings at the Salt Works are still progressing favorably, although there was a slight interruption last week owing to a break in the machinery. The contractor, William McTern and George Ryan are rushing matters, however, and last week struck a flow of considerable oil showing. This is no doubt coming from the same extensive oil field which extends for miles around. Those interested in the finding of salt are sanguine that their efforts will be finally crowned with success."

St. Andrews Beacon - Nov. 13, 1913 Work has been resumed at the Salt Works, about a dozen men being employed. Thomas Kent of St. George has his boring machine on the ground and a hole is being sunk. - Kings County Record."

Kings County Record - Jun. 5, 1914 It is understood that Capt. Vander Oston, representing the German Syndicate of Berlin, who hold large mining area in N.B. will shortly be in N.B. again on his return from Berlin and will commend work at several points in the Province and especially in Kings County."

Kings County Record - Jul. 16, 1915 The salt works near Plumwesweep are still lying idle, though reports are that an effort is being made in London to set the matter in motion again. It si to be hoped it is correct as the thing, if properly developed and rightly handled would be a good dividend paying investment."

Kings County Record - Dec. 9, 1946 Taken from a Record of 1902 the following articles were found in the Late Leonard Allison's scrapbook: Messrs. Hendricks Bros., of Plumwesweep, have sold their well known salt springs and farm to an English syndicate. The amount of the purchase price while not definitely known is believed to be in the vicinity of $10,000. Messrs. Hendricks, through their agent, a Mr. Walker, have been negotiating for the sale of their property for some years, but it has only been recently that matters have assumed definite shape. Mr. William Harvey, of London, England, representing English capital, is the purchaser, and through his representative in Canada examined the property recently. It is expected the bargain will be closed shortly and the property taken over. That the gentlemen who have made the purchase mean business is evidenced by the fact that they have secured from the local government exemption from royalty fees for ten years, and have been negotiating with the I.C.R. authorities for the putting in of a siding at Plumwesweep Station, the idea being to pump the water from the location of the present works to a point near the railway. Their intention is to manufacture a high grade dairy salt, for which the spring has in the past seemed particularly suited. A Record representative was recently shown a diploma for excellence received by Messrs. Hendricks for the Sussex salt shown at the Glasgow exhibition, 1901, and a similar diploma was received for their salt shown at the World's Fair at Chicago. Local Sussex salt has been used for many years and is said to possess qualities as a butter salt which make it better than any on the market. With improved methods of manufacture Sussex salt should have a wide sale. Besides salt the company will manufacture soda and other by-products."

Kings County Record - Aug. 13, 1964 PHOTO.- Caption. - Many a Motorist has been caught in the past by a sign reading: 'Cool, sparkling spring water', as it appeared in front of this pool at Plumwesweep, near Sussex. The sign neglected to say that it was salt water. It is believed some tourist, who got stuck with the salt water in the cooling system of his car, was responsible for erection of the sign. Local residents have halted tourists filling their cars' radiators with this 'cool, sparkling water' many times but when there wasn't a friendly native around, others were stuck. When the farm's present owner, James M. Thomson, moved to the farm one of the first acts was to tear down this sign. (Record Staff photo). Salt Spring Aids In Award. - Just three miles from Sussex, on the Trans-Canada Highway at Plumwesweep, there is located an artesian well flowing with brine. Just about the right strength for corning beef, and four per cent by official test, this water has been flowing steadily for more than 100 years, with no sign of any change in quantity or quality during that time. Winter and summer, in cold weather or hot, the flow remains unchanged. The earliest record of use is around 1862 when James Brand manufactured salt by evaporation in large iron pots. A similar process was carried on by Thomas Mercer and Hendrick Bros., until 1912, when the land containing the spring was sold to the New Brunswick (Plumwesweep) Salt Works Limited, London, England. This company drilled a well 425 feet deep, hoping to strike the salt bed, but was unsuccessful in reaching it. A large concrete tank was built and a steam boiler was used to supply heat for the process of evaporating the water. This proved quite successful and at the height of production some four tons of salt per month were produced. The salt was of a very fine quality and was much sought after by farmer's wives for making butter, as it would dissolve very completely and did not show on the surface of the butter. Not content to continue with this proven method, further work was done in trying to locate the salt deposit by digging two shafts. The first was started in the immediate vicinity of the well, but due to the nature of the ground had to be abandoned. The second was sunk on the opposite side of the road, about 300 yards from the well, but after it had been sunk to 65 feet the directors of the company decided that enough funds had been expended and ordered the operation discontinued. These shafts were timbered, and a steam hoist was employed to raise the earth and rock to the surface. In 1952 the land and the well were sold to the present owner J.M. Thomson, who utilized the salt water for a swimming pond for the members of his family and the children of the neighborhood. Many specimens of marine plant life have been collected around this salt spring. Lobsters have been kept alive in the water, but no commercial use has been made of it for many years. The last use that was made of it for butter-making was when the Sussex Cheese and Butter Company used it to wash an exhibit of butter for entry in a British Commonwealth Exhibition in London, England, when it received an honorable mention award for the exhibit."

Codes: E5 / IDX_Names: Sussex/ Plumwesweep Salt;

The Story of Sussex and Vicinity, by Grace Aiton, 1967, p. 46-7 'Excursions Among The Indians' from the Journal of John Wist, chaplain to the Honorable the Hudson's Bay Company, 1827, states: '... Vale of Sussex ... Near to the villageis a fine spring from which salt of an excellent quality is made for the table and culinary purposes and if the water were analyzed it would no doubt be found to possess some valuable medicinal qualities. ... '"

The Story of Sussex and Vicinity, by Grace Aiton, 1967, p. 23 Major (Richard Witham) Stockton was born in Flushing, N.Y., in 1733 and later moved to New Jersey, where he married Mary Hatfield, of Elizabethtown. They brought four sons and three daughters to Sussex parish, where he was appointed county magistrate. He began distillation of salt on the present James M. Thomson farm at Plumwesweep. ..."

The Story of Sussex and Vicinity, by Grace Aiton, 1967, p. 42-3 Of Bishop Charles Inglis' visit to Sussex Vale, edited by Dr. W.O. Raymond, we read: '...(August 10, 1792) ... There is onMajor Stockton's land a salt spring, saltier than the water of the ocean by one-eighth as is computed. What is curious, a fine spring of fresh water issues out of the ground a few feet from the salt spring. Several other salt springs are found in the neighborhood.'"

Codes: E5 / A2 / E2 / IDX_Names: Sussex/ Plumwesweep Salt; Albert / Kings County Oil Shales;
Oil and Gas - Kings Co.;

Daily Telegraph - Jul. 6, 1865 Smith Creek, &c. - Last week I was kindly taken for a drive about twenty five miles up Smith Creek. Here is a portion of country, certainly among the most beautiful in the province. The rich alluvial soil along the valley of the stream, and on either side, nearly as far as the eye can reach, has every appearance of careful cultivation, and if one is to judge from the appearance of the farm houses and outbuildings, the happy possessors of the land are reaping their reward. The crops thus far are coming on rapidly and the grass has not looked so well in many years. American companies have several agents travelling throughout the county prospecting for oil and coal. They have met with success in several places. On the road between Petitcodiac Station and Butternut Ridge a party has already commenced boring for oil. The prospect of success is considered good. I saw samples of lead ore, and shale containing oil found in the neighborhood of Sussex. The discoverer, who is a practical man, is of the opinion that there is every probability of coal resembling that of the Albert Mines being yet found in this vicinity. The farmers are beginning to stir themselves about mining matters, and heaps of rock and ugly boulders which were heretofore looked upon as defacing to the fair appearance and injurious to the value of the estate, are most industriously examined and frequently glimpses of mica and other shining substances raise their expectation to a high degree and excite the imagination with pictures of untold wealth. Salt Springs. - I visited, in company of a friend, the celebrated Salt Springs situated on the main road between three and four miles from the station. The buildings in which the manufacture is carried on are in a most dilapidated state. They exhibit a great want of enterprise, pride and care. It is now forty-five or fifty years since these Springs were discovered and their waters turned to account. At that time the enterprising gentleman who took the matter in hand expended a large sum of money in the undertaking, and for several years a most flourishing and paying business was done. Owing to difficulties with the proprietors of the Estate, so I am informed, he was obliged to shut down and since that time the business of manufacturing salt at the springs has been becoming ""smaller by degrees and lamentably less"". Now one man attends to the manufacture, making per day on an average five bushels of salt. This is not sufficient to supply even the demands of the neighborhood, and when it is taken into consideration that this salt is much preferred for butter making and other purposes to the article imported, it is surely a matter of surprise that some person of wealth and ability does not take the manufacture in hand. Any quantity of salt I am told might be manufactured, and there is very little doubt that the speculation would prove a profitable one. Rusticus"

Daily Telegraph - Sep. 15, 1885 Our Mineral Resources. - The mining and metallurgical engineers who pass through our city today, en route to Halifax, will have no time on their outward trip to make themselves acquainted with the mineral resources of our province. We trust that a number of them may take some time to that and before their return. There is reason to believe that our province, in some of its sections at least, is quite rich in mineral wealth. One of the best paying mines in America years ago was the Albertite of Hillsboro, and, though now exhausted in that particular spot, there are indications in both Albert and Westmorland that lead to the hope of further discoveries of this unique mineral. Favorable prospects of striking oil are thought to exist in Westmorland. There are wellknown salt deposits in Sussex and Upham, Kings county, the saline springs issuing from which have long been known. The coal measures of Queens county would interest a mining engineer, and recent discoveries of gold, silver and copper in Albert county are beginning to attract attention. In our local columns a correspondent hasfurnished particulars of a mine just being opened in the vicinity of Elgin."

S.J. Standard - Aug. 8, 1912 Salt and Coal in King's County. - English and Montreal Capitalists Interested in New Ventures. - Sussex, N.B., Aug. 8. - Andrew Blair Aitken and party are here from England and are prospecting for salt beds at the scene of operation of the Plumwesweep Salt Company. Several concerns have failed to make the business go in the past, owing to methods employed, but the new owners propose to sink shafts in order to locate the salt beds. If these are found, pipes will be sunk and the salt washed off the beds, the same as is done at the big salt works in Ontario. By this method dense saturation brine can be procured and the cost of production greatly reduced. Plumwesweep salt ia a very high grade, and when produced has always commanded a ready sale at good prices. A boring outfit is already on the ground and work has been started. Another boring test is being made at Mount Middleton by Montreal capitalists who have become interested in coal formation there. Alexander Kent has his boring machine located in Mill Brook, midway between Mount Middleton and Berwick, and only bad weather has stopped active work. W.F. Mullins is the practical man on the job representing the company. He will be joined the first of the week by leading financial men from Montreal, when a final decision will be reached as to the extent of development work to be undertaken. Many encouraging indications of coal have already been found by those on the ground, and a profitable business is hoped for."

Morning News - Nov. 21, 1855 Geology of New Brunswick, &c. - At a recent meeting of the Boston Society of Natural History, held in this city, some interesting reports were submitted, a portion of which related to the Geology of this and the adjoining Province of Nova Scotia. Those who have an interest in the development of the mineral resources of the Provinces, will be gratified to see that we have within our borders a field for investigation, and whichit seems has attracted attention. From the Boston Traveller, which contains an account of the meeting referred to, we learn that a variety of mineral specimens were laid before the society, as the products of this Province. Among these were two very pretty fossil star fishes, which were presented by Robert Foulis, Esq., of this City, a corresponding member of the society. They were obtained from the postpliocene marls near the gas works, and in return the unanimous thanks of the Society were voted to Mr. Foulis for this and several other donations. During the past summer, Dr. C.T. Jackson was employed by C.D. Archibald, Esq., of London, to make Geological explorations in those provinces. In company with John L. Hayes, Esq., of Washington, the Doctor 8 commenced his search at St. John, and traced rock formations hence along the road leading to Petitcodiac. At the meeting referred to, Dr. Jackson gave a brief sketch of the Geology of New Brunswick and Nova Scotia, and described some of the species of rocks found in these Provinces. We condense his remarks. In St. John, he says, ""we found slates and metamorphic limestones, which, from the occurrence of them of a bed of hard sandstone containing a fossil tree, are regarded as belonging to the Devonian group. No molluscs, or indeed any fossils, are found in the limestone, which is made up of a mixture of the blue and grey varieties, highly metamorphosed by heat, and much disturbed in their stratification. Masses of Sienite, consisting of flesh-colored feldspar and hornblende, without much quartz, are observed at Indian Town, and are rocks of igneous origin. All along the Kennebecasis river, are observed red sandstones of the old red or Devonian group, and atSussex Vale we come to the celebrated salt springs, which rise from the saliferous sandstones, and produce by evaporation the finest and most agreeable table salt. In Hillsboro' we find the lower members of thecoal series, so remarkable for the abundance of fossil fishes of the genus Paleoniscus, and for that highly bituminous quality of coal which has been called Albertite. Hills of snow white gypsum, and some extensivebeds of Anhydrite, occur in Hillsboro', and in otherparts of Albert county. Naptha Springs also exist near the shores of the Petitcodiac river, and Petroleum floats on the surface of the waters that arise from them, and is deposited as a soft bitumen among the grass roots, and in the soil, it being left in its thickened and oxidized state by the water, as it periodically rises and falls with the seasons. On reaching the mouth of Chepody Bay we come to Mary's Point, and Grindstone Island, where beautiful buff-colored, and light red sandstones, of the Carboniferous Group, are quarried for building stones, and a blue variety of the same formation which is used for making grindstones is found. The Mary's Point quarries present a scene of activity, owing to the enterprise of Mr. Archibald, who has employed upwards of seventy-five quarrymen, under the directions of Mr. George Lang, in quarrying out the freestone for architectural uses. - Those sandstones are found to be of excellent quality for building purposes, and are now being largely imported into the United States under the Aegis of the reciprocity Treaty between the United States and Great Britain. Mr. Alger has demonstrated the durable nature of this sandstone, before this society, and our observations authorise us in confirming his opinion, that it withstands the action of the frost even in the climate of St. John. The largest amount of the stone is of a yellowish 9 tint, or buff-colored, but there are also beds of lightred, and grey-colored varieties. They belong to the true coal bearing strata, as is proved by the fossil plants clearly impacted between the beds of stone, and thin seams of bituminous coal, occasionally discovered in them. An outline of rock called the ""Squaw's Cap"" presents us with an abundance of fossil trees, and roots, with smooth and striated surfaces. Occasionally we find siliceous nodules in the blue sandstone, which are called ""bulls-eyes"". They injure the grindstones when they occur, and stones containing them are avoided. Grindstone Island is one mile long, and half a mile broad, and is estimated to contain about 140 acres of quarry stone. The average height of the island above highest tides is 60 feet. In obtaining slabs of the blue sandstone for making grindstones, the tides perform valuable services, for the quarryman has only to split out the rock at low water, and fasten it by chains to his flat boat and allow the rising tide to float it, so that he can transport the stone to high water mark, and leave it where he can work upon it at his leisure. The best grindstones are obtained from the strata which are submerged at every tide. The strata all dip down under the Bay of Fundy, at an angle of 38 degrees to the southward, and the trend of the strata is nearly east and west. The extensive quarries are supplied with heavy and massive cranes and a railway, for the removal of the stones to the wharf, where they are put on shipboard. On examining the ""posts"" of the quarry, we found that stones of from one foot to eight feet in thickness, and of any length and width, could be obtained, and that a supply of coloured stones could be procured in abundance. Most of the stones sent from Mary's Point are sold in New York, Philadelphia and Baltimore, no agency having yet been established in Boston. The exploring party next travelled around the head of Cumberland Bay, and reached the Cobequid Mountains, they found rocks of igneous origin, and colored slate, which lay under the grey sandstones of the coal formation. Mr. Dawson describes these slates as belonging to the Devonian order; contiguous to them are extensive deposits of ocherous oxide of iron, with different species of iron ore, and manganese carbonate of lime, known under the name of ""amberite"". Mr. Dawson has given as his opinion that the immense deposits of yellow oxide of iron have resulted from the decomposition of the carbonate of iron in the antherite. These are the Acadian Iron Mines of Londonderry, N.S. It is supposed that a subaqueous eruption has produced the pulverulent peroxide abounding in these mines. There are small veins, bunches and films of black oxide of manganese in these ores of 10 iron, and this renders them more particularly valuable in the production of steel, since it has been discovered that this ore contains 52 38-100 per cent of pure metallic iron, and if the manganese is all reduced and alloyed with the iron, it will amount to 1 53-100 of manganeseism, the proportion which will make the iron into the finest kind of steel. There is just one blast furnace now in operation at the Acadian mines, smelting these ores, and six Catelan forges are also employed. The iron produced is remarkable for toughness and strength - and is sold exclusively to steel makers in Sheffield, Eng. Since the immediate country around is hardwood forest land, an abundance of charcoal fuel can be obtained, and there will soon be other furnaces built near the mines. Having completed the survey of the numerous mines near the Acadian furnaces, the Doctor and his associates next proceeded to Windsor, thence to the Valley of the Annapolis to Nictaux, where they examined the inexhaustible beds of iron ore which are worked by Mr. Archibald, and have been named the Victoria Mines. Geological examinations of these ore beds were first made in the year 1827 by Mr. Francis Alger and Dr. Jackson. These beds are remarkable for having a great profusion of fossil shells, seeming to indicate that these ancient molluscs had a preference for an iron bed rather than one of clay. - The Report indicates that there are Orthocera and several others, as yet unknown or undescribed molluscs, in these ores, and it is difficult to determine their species. They all appear to belong to the Niagara and Clinton Groups of the New York system. One of the most curious phenomena presented at these mines is the magnetic state of some of the ores, while others not far removed are wholly devoid of magnetism. A great number of mines have been opened lately on these ores, and some new beds have been discovered since the original survey was made. There are two beds, which vary in thickness from 6 to 10 feet, and they have been traced 5 miles in length, and probably extend to Bear River. There are several distinct beds beneath the main ones - very compact and magnetic, others are softer and not magnetic ore. The last variety is seen in the red slates of Little River, and the others near Nictau River. It was found impossible to rely on the compass needle in surveying the magnetic ore beds, for the needle was static over them, and was attracted even when quite remote from the ore - the North point invariably pointing towards the iron ore. These mines may be considered to be inexhaustible, and the wood of the country around, though it may supply fuel for many years, is not adequate to smelt more than a small proportion of the ore in view. Hence it is advisable to export much of the ore to the United States, as well as to make charcoal iron for steel on the spot, for exportation to England. 11 This is being done under the new laws of reciprocity in trade with the British Colonies, which will allow of the exportation of Anthracite to Nova Scotia, free of duty; but the iron made in Nova Scotia cannot be brought to the United States without paying duties, and hence it will be sent to England. Anthracite will smelt the Nictau ores with great ease and iron made will be good but not so valuable as charcoal iron. The result of smelting of the ores proves that either white forge or grey foundry pig iron can be made equal in toughness to that from Russia and Sweden. It also makes fine cast steel, as has been proved by trials made of it in Sheffield, Eng. John L. Hayes, Esq., confirmed Dr. Jackson's statement with regard to Nova Scotia iron. He remarked also that iron, manufactured by means of charcoal, was the only iron used in the chain cables of the U.S. Navy. He thought the value of the charcoal iron over anthracite iron was underrated, especially in places where wood could be obtained. English manufactories are now turning their attention to this country, since the supply of Russian iron has failed, and as the

1792 - Copied form: The Story of Sussex and Vicinity, by Grace Aiton, 1967, p. 42-3 Of Bishop Charles Inglis' visit to Sussex Vale, edited by Dr. W.O. Raymond, we read: "". (August 10, 1792) … There is on Major Stockton's land a salt spring, saltier than the water of the ocean by one-eighth as is computed. What is curious, a fine spring of fresh water issues out of the ground a few feet from the salt spring. Several other salt springs are found in the neighborhood.""

Codes: E5 / Y1 / IDX_Names: Sussex/ Plumwesweep Salt; Salt Springs Salt;
Weekly Transcript - Oct. 4, 1882 Salt Making in Kings County. - In several parts of Kings County there are natural brine springs, from two of which salt is now being manufactured. One of these is situated midway between Penobsquis and Sussex, on the old post road, where the making of salt has been carried on in a small way for half a century. Sussex Salt, as it is called, has an excellent reputation among the dairymen of Kings and the adjoining counties, and all that can be produced at the works finds a ready sale for dairy purposes. The process of manufacture is by evaporation in boilers, wood being used as a fuel. The consumption of fuel is very large in proportion to the amount of salt produced. Many persons, who have given attention to the matter, including a number of scientists, believe that there is a vast deposit of salt underlying a considerable section of the county, and that by boring, salt rock or a much stronger brine would be struck, so as to greatly cheapen the process of evaporation. But so far no boring has been attempted. A natural salt spring of considerable volume has,from the first settlement of the County been known to exist at Upham, and gets the name Salt Springs, to the immediate locality where the spring is situated. A few years ago a manufactory was built there by Mr. J.S. Sharp, but was not extensively carried on. After a time the property passed into the hands of Mr. McCready, by whom it was sold some three years ago to Dr. Parker, of Boston, who has spent a considerable sum in machinery and appliances for making salt. The product is of the very best quality. The method of manufacture, which is novel, is described as follows, in correspondence of the Sun: The water from the spring is run into a reservoir and pumped with a steam engine to the top of a building which stands about 300 feet away, and is of itself a curiosity. It consists of a frame, forty by fifty feet and forty feet high, very strongly built and left open, with the roof at the bottom. The frame is filled with small beech and birch twigs, and as the salt water trickles down through them, the wind blows the fresh water out, and the brine is about ten per cent. stronger each time. The brine falls on the roof below and is conducted by spouts at the cave of the reservoir and is pumped back twice on the brush which makes it very strong. It is then run to the boilers which are made of boiler plate iron (there are five of these and a cast iron boiler) which are kept constantly boiling until the salt is produced, the brine being constantly changed to another nearer the heat as the work progresses. It seems probable that very much less expense than has already been incurred at Sussex and Upham would have produced better results had boring been resorted to, as was done at Goderich, Seaforth and Clinton, Ontario. In the latter place at a depth of about 1,100 feet a solid body of pure salt, from 80 to 100 feet thick, was struck by boring. This was dissolved, and the strong brine so formed pumped to the surface and evaporated in oblong, shallow pans, 120 by 20 in length and breadth. The process of evaporation by the heat of the sun, as practiced at Syracuse, New York, or of the reduction of the brine by freezing, as practiced successfully in Russia, seem not to have yet been tried in Kings, though the hot summer and cold winter would seem to offer special advantages for both these methods."

Daily Telegraph - Oct. 10, 1888 New Brunswick Salt. -Some day a salt mine will be discovered in our province and all will then wonder that it was not found long before. That is what happened at New Iberia, Louisiana, about 25 years ago. Some small salt springs existed, and salt had been manufactured for local use in a very small way since the beginning of the century. During the war much of the southern country was cut off from its supply of salt, and Iberia became a busy place for its manufacture. The supply of brine proving insufficient, an old well was cleaned out under the direction of Mr. John M. Avery, the owner of the place. In digging this well still deeper the negro at work told his master that he had struck a log and could go no further, whereupon Mr. Avery descended and discovered a hard rocky substance, which, upon examination, proved to be pure rock salt. This, the first discovery of the salt, was made at a depth of only 16 feet. It put an end to the manufacture by evaporation, and soon wagons by the thousand were used to transport the rock salt in all directions. Now a branch railroad connects the salt mine with the railway system of the state. The rule is that where there are brine springs there is rock salt comparatively near the surface. In Ontario, where immense beds of rock salt have been found at depths of from 1,000 to 1,500 feet, there are no brine springs showing at the surface and the underlying mineral was never suspected until in boring for oil the bed of salt was struck. There is therefore good reason to believe that rock salt exists within easy mining distance from the surface at both Sussex and Upham, where the brine springs have so long been known. It is not probable that salt rock will be found within 16 feet, as in Louisiana, but the chance of finding it within a hundred or two is well worth being prospected for. A salt mine would be a valuable addition to our industries, but there is little to be made in the present slow process of evaporating brine from the springs."

Codes: E5 / Y1 / O7 / E2 / IDX_Names: Sussex/ Plumwesweep Salt; Salt Springs Salt; Salt/Potash - Sussex Area; Oil and Gas - Kings Co.;
Daily Telegraph - Dec. 13, 1890 Salt in New Brunswick. - Boring For It -Indications That it Lies in Accessible Situations. - Edward Jack. - There are strong probabilities that wehave in this province large deposits of salt, in situations very accessible to railway transportation. The indications which point to the existence of such are the various salt springs in Kings County and the occurrence of the salt spring or brook at Plaster Rock, on the route of the Tobique Valley railway.

This latter seems to point to the possible existence of other salts than common rock salt. The occurrence of rock salt has been noted in almost every geological formation, with the exception perhaps of the very oldest. It is generally associated to a greater or less degree with sulphate of lime (plaster). In the instances to which reference is here made to the existence of salt springs in New Brunswick, the rock formation in which they occur is usually regarded as being in what geologists call the Lower Carboniferous. Taking into consideration the occurrence of thesesprings in such promising situations, and as instances without end can be cited where petroleum as well as inflammable gas has occurred in association with salt springs, it would seem as if it would be an advisable matter for the provincial government to give the subject of boring in New Brunswick for salt that consideration which the importance of the strong chance of its discovery in quantities here demands; and it would not be out of place, that a certain sum of money should under an existing act be risked on such a venture. As a preliminary it might not be out of place for the executive to consult Major Markham, of Sussex, on the probable cost which would attend such operation. Should an appropriation be made, it ought to be placed in the hands of the major or of some other equally reliable and practical man, who should be authorized to contract with experienced borers to do the work at certain rates per foot. It might be possible also that such borings, especially at Plaster Rock, would be the means of discovering some deposits of these salts of potash which have made Stassfurt so celebrated of late years, where so long ago as 1839 borings were made under the hope of finding salt, and brine was actually obtained in 1843, but it was so highly charged with magnesium compounds which is said to be the case with the salt spring at Plaster Rock, that it was considered not to be worth working. Certain geologists, however, who had made a study of the subject, felt sure that the magnesium had some other source than the bed of rock salt of whose existence they were convinced; this view was corroborated by the matter brought up by subsequent borings. In 1856 two shafts had been sunk to the depth of 1,100 feet each where a bed of rock salt was struck. Before reaching this they had passed through the overlying deposit of potash salts which had been indicated by the nature of the lime above mentioned. At this time their value was not suspected. Up to the year 1856 all of the salt produced in Germany has been the result of evaporation of saline waters. More than 40 years ago, however, the development of various industries in Prussia demanded a much larger supply of salt than could conveniently be had there and numerous borings, particularly in the localities where salt springs occurred, were made. At Stassfurt, they were begun in 1839 with the results mentioned above. The explorations of rock salt, began there in 1857, had already furnished considerable quantity of that material to the public before the utilization of its superimposed bed of potassium salts was thought of. It was Henry Rose who, in 1859, disclosed to the world all the importance of these various potash compounds, and as a result, in the year 1860 - 2,800 quintals of them were made use of in agriculture; in 1861 eight times as much, while in 1862 the quantity raised was 80 times greater, and since this period it has always been increasing. The present workings at Stassfurt have already made known the existence of a mass of carnalite corresponding nearly to six millions of tons of chloride of potassium supposed to be pure. In 1870 the annual extraction of potassium salts at Stassfurt had reached the quantity of 145,000 tons and for the city of Leopold ..?.. her neighbour, that

Codes: E7 / IDX_Names: Mineral Paint - General;
Moncton Daily Transcript - Aug. 1, 1889 Mineral Paint. - A Big Deposit on Mr. Eliakim Fisher's Property. - Mr. Eliakim Fisher has what is confidently believed to be a very valuable deposit of mineral paint on his farm at Scoudouc River, about six miles this side of Shediac. When burnt and ground it produces excellent paint of brownish red colour, especially suited for the roofs of buildings. Mr. Fisher has known the existence of the paint and used it on his farm buildings for perhaps ten or twelve years, and during the past few years its use been pretty general among the residents of that vicinity. Mr. Fisher dug and prepared about a ton and a half of it last fall and this year disposed of a large number of samples of it. A quantity of ot was sent to the furniture factory at Bass River, N.S., and Mr. Fisher is just in receipt of a letter from them testifying as to its excellent quality. A few pounds of the paint were sent to an analyst in Boston and pronounced by him to be the very best mineral paint which had come under his observation. He added that if the deposit were extensive its owner had a bonanza. Mr. Fisher says there is no doubt whatever of the great extent of the deposit. He is considering the advisability of taking steps to develop it at an early date, and Moncton capitalists who are looking for a paying speculation might do worse than examine the property in question. Mr. Henry Jones, of Moncton, has used some of the paint on his buildings with marked success, and it has been found to be of a very durable character."
Moncton Daily Times - Aug. 2, 1889 Mineral Paint Deposit. - Eliakim Fisher is taking steps to develop a large deposit of mineral paint on his farm at Scoudouc, six miles from Shediac. The paint is a dark red and has been used by farmers in that vicinity for several years and was recently analyzed in Boston and declared to be of the very best quality. Mr. H.A. Jones of Peters, Jones and Lounsbury, Moncton, has also used this paint with good results."

Codes: E7 / IDX_Names: Mineral Paint - General;
S.J. Daily Sun - Jul. 22, 1890 Sussex. - Fred W. Stockton is exhibiting some mineral paint discovered on his property a short distance from Sussex. One local painter has tested it and says this paint is of excellent quality."

S.J. Daily Sun - Sep. 29, 1890 Exhibition. - W.H. Magee of Halifax shows in the same section several samples of mineral paints."

Moncton Daily Times - Jan. 5, 1892 and S.J. Daily Sun - Jan. 6, 1892 Minerals in Northumberland. - A Wonderful Paint Discovery. - Gold and Silver Bearing Quartz. - A correspondent writes to the Moncton Times: The discovery of a valuable deposit of oxide of iron paint, of a quality which is unique, on the northwest Miramichi river, about twenty miles from

Newcastle, has much interested scientific men who have examined it. It has been assayed and found to consist of 96 per cent. Of pure oxide of iron. It comes out of veins in a slaty formation of rock, the veins being narrow on the surface and gradually widening as they sink. Mr. Brumell of the Dominion geological survey, who examined these deposits, says there are no similar deposits known to scientists. It comes out pure and ready for use and in consistency like putty; may be immediately mixed in linseed oil for painting, and is of a beautiful rose color. Two pounds will give the required body in one gallon of oil. Mixed with water it makes a durable staining paint, as the color is very strong. Four or five pounds of the oxide will give a strong pink color to the barrel of whiting. One ounce will color deeply a pail of water. Mr. John Ferguson of Newcastle, who holds the mining licence to this deposit, has a valuable property and has under consideration offers from capitalists for its purchase. A promising vein of the same natural paint has also been located on the property of the Miller-Johnson-Robertson syndicate. The paint is valuable above all other paints for the following reasons: more durable than best white lead, less being required to make a body in oil. After being mixed does not require any process before being used, and can be used for coloring numerous substances, such as whiting, lead, putty, etc. The coloring is several hundred per cent. Greater than any known pigment, and cannot be burned, it being also entirely fireproof, etc., making it a valuable fireproof cement. The uses it can be put to are undoubtedly more numerous than at present known. Shortly after the discovery of the paint deposits, several large veins of gold and silver-bearing quartz in the same neighborhood were located by Walter MacDougall, a western mining expert, sent down here by Montreal parties. Mr. McDougall located several miles of mining licenses on these veins of quartz for his employers, and although no blasting or digging has been done, some specimens of the outcropping of quartz on the surface were sent to both London, Eng., and Ottawa, Ont., for assay, and both assays agreed that there were traces of gold and silver, and that the quartz was undoubtedly gold and silver bearing mineral. The lateness of the season forbade any further immediate investigation, but the spring will likely see a mining boom. These deposits are located in what the government of New Brunswick has named in their crown land maps the Johnson Gold District , as the William Johnson-Robertson company of Montreal has several square miles now located in that region. As Nova Scotia has attracted so much American capital, now that Northumberland county has a gold district the attention of such capital ought to be called in this direction. The Ferguson-Coleman syndicate have also a mining claim in this gold area. This syndicate includes M. Adams, M.P., F.B. Coleman of Fredericton, and R.A. Lawlor of Chatham."

S.J. Daily Sun - Jan. 5, 1892 Mineral Paint. - Reported Valuable Discovery About Twenty Miles from Newcastle. - (Special to the Sun). - Moncton, Jan. 4. - A valuable discovery of mineral paint is reported from the northwest Miramichi, about 20 miles from Newcastle. An assay shows it to be composed of 96 per cent pure oxide of iron. It comes of veins of a slaty formation of rock, of the consistency of putty and ready for use. Mr. Brumell of the Dominion geological survey is much interested in the deposits. He says there is nothing like them known to scientists. The deposits are extensive. The paint is ready for use when taken from the rock, two pounds giving the required body to a gallon of oil. Mixed with water, four or five pounds of the oxide will also give a strong rose color to a barrel of whiting, and as it is fire-proof it is more durable than white lead and much stronger than any other known pigment. John Ferguson of Newcastle holds a mining license for this deposit, and it is thought he has a bigthing. Gold and silver bearing quartz has also been discovered in the same neighborhood, having been located by Walter McDougall, acting for Montreal parties. The Johnson-Robertson company of Montreal have several miles of mining licenses located, in which Mr. Adams, M.P., and Mr. Coleman of Fredericton are interested, have also a square mile of the gold area. It is expected there will be a greater boom in mining in this part of Northumberland next spring."

St. Croix Courier - Jan. 14, 1892 Great excitement has been caused at Newcastle by the discovery of a rich find of mineral paint, on the Miramichi. It is composed of 96 per cent. of pure oxide of iron."

N.B. Reporter - Feb. 1, 1899 Large deposits of umber have been discovered on the farm of Robert Spicer, Spencer's Island. Mr. Spicer intends starting a paint manufactory in the spring."

North Shore Leader - Sep. 20, 1907 Red Paint Found On The North West. - Mr. John Ferguson and others, who own a property on the North West in the vicinity of Chaplin Island, are placing upon the market a new and unique variety of red paint, which promises to eclipse any paint now for sale anywhere. Mr. Ferguson has several barrels of the crude material in his store here. It is a reddish mineral which is 95 per cent. pure oxide and 5 per cent. silica. All the preparation it needs is a mixture with oil, when it gives a glossy red coating to whatever it is applied to. Its color cannot be appreciably changed, although at white heat it darkens infinitesimally without losing any weight. It kills out any other color with which it comes in contact. The mineral is very soft, and a packed pork barrel of it shipped to the United Paint Co., Ltd., Dorchester, N.B., weighed 1,100 lbs. The paint is not only fireproof, but it has no affinity for turpentine. Mr. Ferguson shows a bottle into which the paint and turpentine were placed. The paint was precipitated on the sides while the turpentine is unmixed within. It mixes readily with water, yet when mixed with oil and dried it is not affected by the rain. A strange feature of the raw material is that, dissolved in water it forms a barometer. In fine weather it will soon settle to the bottom leaving the water above clear. Before a storm it will cloud the water. There is lots of the mineral on the NorthWest, and Mr. Ferguson and his associates hope to revolutionize the paint industry."
Evening Times and Star - May 21, 1910 Jos. Bradley, M.E., has been spending some days in Sussex looking into the

possibilities of mineral deposits in New Brunswick and Nova Scotia such as graphite, umber, sienna, baryta. He company with E.A. Charlton has visited points in New Brunswick, also in Digby County, (N.S.) with very much success so far. -

S.J. Daily Telegraph - Dec. 8, 1979 St. Stephen, Dec. 6. - Minerals. - Among the latest discoveries is a bed of yellow ochre, and a soft coal mine, both within the town limits. We await further developments with interest."

Codes: E7 / X1 / IDX_Names: Mineral Paint - General; Grand Lake Coal;
Daily Telegraph - Dec. 13, 1888 Mining in Queen's. - There is quite a boom in coal mining just now. Coal Creek on the Central railway is the centre of one of the mining enterprises. The American syndicate who have acquired extensive mining rights there have now a number of men engaged with steam power sinking a shaft, and will be shipping coal by rail at an early if the weather permits the finishing of the road to that point. The Messrs. King are engaged in erecting a blacksmith shop and boarding house for the works. They contemplate a quite extensive erection of buildings next spring. The same company is also conducting boring operations at Newcastle, and will erect buildings there. A telephone line is being erected to connect the manager's residence at Salmon River with the Coal Creek mines. Another association has been formed to push mining operations at Newcastle. Formerly the river steamers did not patronize Queen's county coal, but for some months past Messrs. Tapley Bros. have been using it in the tug boats and found it highly satisfactory. The result of this trial has induced them to invest in the coal business along with Messrs. Waring Bros., of Indiantown, and Mr. Samuel Green of Newcastle, who owns coal lands there. They have acquired other mining lands, and are now constructing a tramway for their mines to Flower's Cove, Grand Lake. They expect to supply coal for the tug service and also for the St. John market, and for general shipment and sale next year. A paint mine at Coal Creek is to be developed by Mr. Silas McMann, of St. John, associated with otherswhom he has interested in it. They have acquired mining rights."

Novascotian - Sep. 16, 1850 Resources of Nova Scotia. - The London Tablet furnishes the subjoined relative to Nova Scotia ... We have heard that a proposition was made by Dr. Gesner a few years ago, to the then leader of Lord Falkland's government to survey some portions of this province, containing large quantities of mineral resources which through some mistake, we suppose, do notfall under the surveillance of the Mining company. But for some reason or other this suggestion was not complied with. The truth is this Mining Association possessing as it does almost unbounded wealth exercises a corresponding amount of influence and we very much fear that the evils of which the Tablet complains and which we are apparently destined to bear for many years to come, are beyond the reach of those most interested. But we must let the Tablet tell its own story in its own way:- ...... There are many most valuable mines in Nova Scotia and New Brunswick, of metals, coals, plaster, paints, &c., but all of these have long ago been given by George the Third to his hopeful son, the late Duke of York, of anti-Catholic memory. His Royal Highness got over head and ears in debt by gambling and profligacy, 15and made over all his interest in the mines of those regions to his creditors. His creditors are Englishmen, and they lay claim to everything in the shape of stone, or cement, or coals, or metals found beneath the surface of the earth. The consequence is, that iron monopoly binds and benumbs all the resources of this region, like the enchanted maidens which we used to read of in our boy-days, who were held captive in enchanted castles till the knight errand deliverer arrived. Now, lest people may say I talk at the English Government merely for talk's sake I supply two facts, which exhibit the true state of things here. Twenty-seven miles north of Fredericton, in Brunswick, resides a Mr. Marshall, who, some couple ofyears ago, bought and paid for a farm to the agent of the government. He began to cultivate it, and in the course of his labors discovered a coal mine. He opened it, and began to dig the coal, and found it good to burn; soon he began to sell coal, but the Government agent soon snuffed the cent; notice to desist was served on Mr. Marshall; the mine was soon sold to another, with a right, through Mr. Marshall's land, to enter to the mine forever; a forced trespass in perpetuity by order of the Queen.There is a lead mine in the neighborhood, also, amountain of stony substance, of which Spanish brown paint is made - but all these treasures are sealed by the Queen's authority, in behalf of the monopolists, created by former patents, or to be created by patents to come. ..."

St. Andrews Standard - Jul. 22, 1874 Red Granite. - It appears that Charlotte County abounds with Red Granite. Levi Young, Esq., of Digdeguash, St. Patrick, has recently discovered a large bed of that stone on his lands, adjoining the river. He had some of the stone quarried, and sent to the polishing mill. Its contiguity to the river, and the cheap mode of shipment will give Mr. Young an advantage over other quarries. It is reported that some other valuable mineral deposits have been discovered in the same vicinity, among which are iron and mineral paint."

N.B. Courier - Sep. 30, 1837 LETTER III. To His Excellency Major General Sir John Harvey, K.C.H. and C.B., Lieutenant Governor and Commander in Chief of the Province of New Brunswick, &c. &c. &c. May It Please Your Excellency: Resuming the subject of my last letter, and the route from Petitcodiac River along the main road to Saint John,I found the road after leaving Holstead's Inn, to pass over a considerable hill called the Portage. The rocks of this hill are sandstone of the coal measures; and among them fossil Cacta Calamide and impressions of leaves are visible where the strata appear at the surface, which in general is covered with a meagre soil. The Portage is four miles long, and although narrow and
